## PREFATORY

NO argument from any one need be adduced to emphasize the importance of good books. Every home and almost every individual feel their necessity as completely as that of food, clothing and shelter. The chief difficulty is that there are so many books in the world, and so diffuse, that the essential facts contained in them must of necessity be epitomized and condensed to meet the requirements of the present day. Otherwise it would be impossible for the average reader or consulter to gain the help and mental sustenance from them that they should yield because of the time, energy and outlay involved in collecting, reading and digesting a large number of volumes.

We of the present day have a rich heritage in this recorded knowledge of all countries and ages. It is the common property of mankind. Such facts belong to no individual nor set of individuals. No gloss of language nor deftness of paraphrase can re-create them into individual property. They are for all—the birthright of all; and no compiler, collator or editor can do a more important service than that of rendering them available for common use.

The Volume Library is an honest effort to compress within reasonable compass the vital, digested, practical essentials of this vast mass, adapted to the wants of a great variety of learners of varying degrees of intellectual growth. To do this, the editor has called to his aid many of the most distinguished specialists, who have prepared articles on important subjects in accord with the general design of the work. This combination of educational specialists, supplementing the editor's own experience of nearly two decades in preparing this type of books, has achieved results that, it is believed, have been hitherto unattained. At least, the quick and usually unerring judgment of practical minds in many different spheres of activity have so pronounced.

The aim of the volume is intensely practical. It is a book of facts and principles, with so much of their application as a "decent respect for the opinions" of others will permit.

The classification followed seems to be that dictated by practical needs and demands; certainly no other has been as acceptable to the large clientele of the editor's previous works of this class; and it is still more certain that no classification has ever been devised that has been entirely satisfactory to every one.

Book I. gives special attention to the practical aspects of education in the home and school. The kindergarten, primary education, secondary education, vocational education and higher edu-

cation, have each been treated by master educators in a most helpful manner.

Book II. is a concise, comprehensive treatment of the essential subjects and facts in the field of arts and sciences. It contains numerous valuable tabulations and other special features connected with history, language, literature, biological and physical science, fine arts, religion, government and law.

Book III. is a luminous treatise on the mechanism of trade and industry by skilled specialists. It deals specifically with the great basic industries—agriculture, manufacturing, mining, fisheries, forestry—as well as with the economics of business, commerce and finance.

Book IV. is a comprehensive gazetteer of the world, and comprises physiography, statistics, and descriptive, political, economic and commercial geography.

Book V. is an atlas of the United States and Insular Possessions, containing maps of all county divisions of the States and Territories, and the environs of a number of cities.

Book VI. is a dictionary of biography, giving brief sketches of four thousand leaders in various pursuits and ages, and special sketches of one hundred of the world's greatest masters in literature, art, religion, philosophy, science, politics and industry.

Book VII. is a multiplex dictionary comprising, in addition to the usual features of our best concise dictionaries, the syllabication and pronunciation of words; synonyms and antonyms; and the origin of personal, geographical and curious names.

Of special interest and usefulness are the numerous bibliographies scattered throughout the volume, and the illustrations in color and sepia.

These various features combined in one volume constitute the essence of a veritable library; and in point of practical use, comprehensiveness, range of topics, clear and approved classifications, graphic presentation of facts, quick reference, and thorough up-to-date-ness it will be found an adequate equivalent for several hundred or more books. Indeed, as many thousand, almost, have been drawn upon in its preparation, in addition to the special contributions contained.

It is impossible that in its first edition the Volume Library should be without error, typographical and otherwise. We shall esteem it a special favor, therefore, to have our attention called to any real or supposed inaccuracies in order that they may be investigated and corrected in future editions.

## EDITORS AND CONTRIBUTORS

HENRY W. RUOFF, M.A., LITT.D., D.C.L. *Editor-in-Chief*  
Editor of *The Century Book of Facts, The Capitals of the World, Leaders of Men, The Standard Dictionary of Facts, Masters of Achievement, etc.*

RASMUS B. ANDERSON, LL.D. *Scandinavian Literature*  
Formerly Professor of Scandinavian Languages and Literature, University of Wisconsin; ex-United States Minister to Denmark; author of *Norse Mythology, Viking Tales of the North, etc.*

EDOUARD P. BAILLOT, B.Sc., L.H.D. *French Writers*  
Professor of Romance Language and Literature, Northwestern University; author of *Baillet's and Brugnot's French Composition, etc.*

CHARLES E. BESSEY, Ph.D., LL.D. *Botany*  
Professor of Botany, University of Nebraska; author of *Essentials of Botany, Botany for High Schools and Colleges, Elementary Botany, etc.*

CALVIN S. BROWN, Ph.D., D.Sc. *Comparative Literature*  
Professor of German Language and Literature, University of Mississippi; author of *Later English Drama, editor of Tennyson's Knock Arden, etc.*

G. MONTAGUE BUTLER, E.M. *Geology and Mineralogy*  
Department of Geology, Colorado School of Mines; Geologist for Colorado Geological Survey; author of *A Pocket Handbook of Minerals, etc.*

SUSAN FRANCES CHASE, M.A., Ph.D. *Elementary Education*  
Department of Psychology and Literature, Buffalo State Normal School; author of *Talks to Teachers, Outlines of Literature, etc.*

THOMAS ARKLE CLARK, LITT.D. *Correct Use of Words*  
Dean of Men, University of Illinois; author of *English Composition, Great American Authors, etc.*

FOSTER D. COBURN, D.AGR. *Agriculture and Horticulture*  
Secretary Kansas Department of Agriculture; author of twenty volumes on agriculture, *Swine Husbandry, Alfalfa, etc.*

JOHN M. COOPER, Ph.D., S.T.D. *Roman Catholic Church*  
Professor of Christian Doctrine, Catholic University of America; rector of St. Matthew's Church, Washington, D.C.

ALVIN DAVISON, M.A., M.D., Ph.D. *Physiology and Hygiene*  
Professor of Biology, Lafayette College; author of *Davison's Human Body and Health, etc.*

SAMUEL A. ELIOT, M.A., D.D. *Unitarianism*  
President of the American Unitarian Association; author of numerous addresses, lectures and sermons.

AXEL L. ELMQUIST, M.A. *Swedish Literature*  
Head of Department of Scandinavian Languages, Northwestern University.

JOHN O. EVJEN, Ph.D. *Lutheranism*  
Professor of Theology, Augsburg Seminary, Minneapolis; author of *Scandinavia and the Book of Concord; Confessional Subscriptions in Germany; and of many contributions to religious encyclopedias, etc.*

ALFRED FARLOW, C.S.D. *Christian Science*  
Reader The First Church of Christ, Scientist, Boston; head of Christian Science Publication Committee, etc.

LOUIS A. FISCHER, B.Sc. *Weights and Measures*  
Chief of Division of Weights and Measures, U.S. Bureau of Standards; author of *History of Weights and Measures; The Prototype Meter; etc.*

ALCEE FORTIER, LITT.D., LL.D. *French Literature*  
Professor of the French Language and Literature, Tulane University; author of *History of French Literature, Louisiana Folk Tales, History of France, etc.*

JOHN F. GENUNG, D.D., Ph.D. *Figures of Speech*  
Professor of Rhetoric and English Criticism, Amherst College; author of *Practical Elements of Rhetoric, Working Principles of Rhetoric, The Idioms of the Apos, etc.*

WASHINGTON GLADDEN, D.D., LL.D. *Congregationalism*  
Pastor of First Congregational Church, Columbus, Ohio; author of *Who Wrote the Bible, Applied Christianity, etc.*

John F. Genung

John O. Evjen

Samuel A. Eliot

Washington Gladden

*Shuman & Johnson* **E. H. Lewis** *Saint Louis* *St. Louis* *H. K. H. H.* *J. W. Jenkins*

*George Hodges*

*Sherman Kirk*

*Charles A. McMurry*

*Mar. D. Learned*

**WM. ELLIOT GRIFFIS, D.D., L.H.D.**

*Oriental Literatures*

Author and Lecturer; formerly Professor in the Imperial University of Tokio, Japan; author of *The Mikado's Empire*, *Asiatic History*, *The Japanese Nations in Evolution*, etc.

**FOSTER ERWIN GUYER, M.A.**

*Phonetics*

Department of French Language and Literature, Northwestern University.

**G. STANLEY HALL, Ph.D., LL.D.**

*Ends and Aims of Education*

President of Clark University, and Professor of Education and Psychology; author of *Adolescence*, *Youth - Its Education*, *Beginnings and Hygiene*, etc.; editor of the *American Journal of Psychology*, *The Pedagogical Seminary*, etc.

**SAMUEL B. HARDING, M.A., Ph.D.**

*History*

Professor of History, Indiana University; author of *The Story of the Middle Ages*, *Essentials in Mediaeval and Modern History*, etc.

**ELIZABETH HARRISON**

*Kindergarten*

Co-Principal Chicago Kindergarten College; author of *Study of Child Nature*, *In Story-Land*, *Two Children of the Foothills*, *Kindergarten Building Gula*, etc.

**EMIL G. HIRSCH, L.H.D., LL.D., D.C.L.**

*Jewish Religion*

Professor of Rabbinical Literature and Philosophy, University of Chicago; minister of Sinai Congregation, Chicago; associate editor, *Jewish Encyclopedia*; author of many articles on religion, etc.

**GEORGE HODGES, D.D., D.C.L.**

*Episcopal Church*

Dean Episcopal Theological School, Cambridge, Mass.; author of *The Episcopal Church*, *The Pursuit of Happiness*, etc.

**JEREMIAH W. JENKS, Ph.D., LL.D.**

*American Government*

Professor of Politics and Economics, Cornell University; author of *The Trust Problem*, *Citizenship and the Schools*, *Government Action for Social Welfare*, etc.

**CHARLES F. JOHNSON, Ph.D., L.H.D., LL.D.**

*English Literature*

Professor of English Language and Literature, Trinity College; author of *History of English and American Literature*, *Elements of Literary Criticism*, etc.

**DAVID STARR JORDAN, Ph.D., LL.D.**

*Outline of Science; Fisheries*

President of Leland Stanford Jr. University; author of *Science Sketches*, *Footnotes to Evolution*, *Animal Life*, *Food and Game Fishes of North America*, etc.

**CHARLES W. KENT, Ph.D., LL.D.**

*American Literature*

Professor of English Literature and *belles lettres*, University of Virginia; author of *Graphic Representations of English and American Literature*; editor *Library of Southern Literature*, *Poe's Poems*, etc.

**J. STERLING KINGSLEY, M.A., D.Sc.**

*Zoology*

Professor of Biology and Zoology, Tufts College; author of *The Standard Natural History*, *Elements of Comparative Zoology*, *Popular Natural History*, etc.

**SHERMAN KIRK, M.A.**

*Disciples of Christ*

Dean of the College of the Bible, Drake University, and Professor of Greek and Hebrew.

**MARION D. LEARNED, Ph.D., L.H.D.**

*German Literature*

Professor of the German Language and Literature, University of Pennsylvania; author of *German Grammar*, *German Diaries of the American Revolution*, and numerous contributions on German history and literature.

**EDWIN H. LEWIS, Ph.D., Litt.D., LL.D.**

*English*

Dean of Lewis Institute and Professor of English; author of *History of the English Paragraph*, *A First Book in Written English*, *Applied English Grammar*, etc.

**SIMON LITMAN, JUD.D., Ph.D.**

*Business Economics*

Department of Commerce, University of Illinois; author of *Trade and Commerce*, *The Lohndollartheorie*, etc., and of many articles on commerce and industry.

**CHARLES A. MCMURRY, Ph.D.**

*Secondary Education*

Professor of Psychology and Pedagogy, Illinois State Normal School; author of *The Eight Grades*, *Methods in Elementary Science*, *Nature Study Lessons*, etc.

**ALBERT R. MANN, B.Sc., M.AGR.**

*Farm Products, etc.*

Professor of Agricultural Editing, New York State College of Agriculture, Cornell University; assistant *Editor of Encyclopedia of Agriculture*, etc.

**SHAILER MATHEWS, M.A., D.D.**

*Baptist Church*

Dean of the Theological School, University of Chicago; author of *History of New Testament Times*, *The Gospel and the Modern Man*, etc.

**ALAN W. C. MENZIES, B.Sc., Ph.D.**

*Chemistry*

Department of Chemistry, Chicago University; contributor to *Chamber's Encyclopedia*, *Nelson's Encyclopedia*, etc.

*Elizabeth Harrison*

*David Starr Jordan*

*Charles W. Kent*

*Simon Litman*

*J. M. Owen*

*H. H. Parker*

*Harry T. Peck*

*William H. Roberts*

*Paul Shorey*

*Wm. A. Scott*

JESSE MYRON OWEN, B.A., Ph.B. *English*  
Associate Professor of English Language and Literature, Lewis Institute.

EDWARD W. PARKER, F.A.A. *Mines and Mining*  
U. S. Geological Survey; author of many articles on Mineralogy, Mines and Mining, Petrography, etc.

HARRY THURSTON PECK, Ph.D., L.H.D., LL.D. *Latin Literature*  
Anthon Professor of Latin Language and Literature, Columbia University; co-editor *New International Encyclopedia*, editor of *Harper's Classical Dictionary*, etc.

WILLIAM H. ROBERTS, D.D., LL.D. *Presbyterian Church*  
Formerly Moderator of Presbyterian General Assembly; author of *History of the Presbyterian Church, Laws Relating to Religious Corporations*, etc.

WALTER E. ROLOFF, M.A., Ph.D. *Literature; Translator*  
Department of Germanic Language and Literature, Northwestern University.

WILLIAM A. SCOTT, M.A., Ph.D. *Banking and Finance*  
Professor of Political Economy and Finance, and Director of the School of Commerce, University of Wisconsin; author of *Money and Banking, State Banks*, etc.

HOMER H. SEERLEY, M.A., LL.D. *Normal Schools*  
President of the Iowa State Teachers' College; formerly president Department of Normal Schools, National Educational Association; co-author of *History and Civil Government of Iowa*, etc.

GEORGE W. SHERBURN, M.A. *Assistant Editor of Dictionary*  
Department of English Language and Literature, Beloit College.

PAUL SHOREY, Ph.D., LL.D. *Greek Literature*  
Professor of Greek Language and Literature, Chicago University; author of *The Odes and Epodes of Horace, The Unity of Plato's Thought*, etc.

ALEXANDER SMITH, Ph.D., LL.D. *Chemistry*  
Director of Physical and General Chemistry, Chicago University; author of *Laboratory Outline of General Chemistry, Introduction to General Inorganic Chemistry, Teaching of Chemistry and Physics*, etc.

FRANKLYN B. SNYDER, Ph.D. *Assistant Editor of Biography*  
Department of English Language and Literature, Northwestern University.

FREDERICK STARR, Ph.D., D.Sc. *Ethnology; Anthropology*  
Professor of Anthropology, University of Chicago; author of *First Steps in Human Progress, Strange Peoples*, etc.; editor of the *Anthropological Series*.

# TABLE OF CONTENTS

## BOOK ONE

### THE FIELD OF EDUCATION

**Part I. End and Aim of Education.** PRIMARY EDUCATION: Good Books; Arithmetic; Nature Study; Geography; History and Civics. INTERMEDIATE SCHOOLS: Moral Instruction; A Sound Body. SECONDARY EDUCATION; INDUSTRIAL TRAINING; COLLEGIATE EDUCATION; PROFESSIONAL EDUCATION..... 17

**Part II. The Kindergarten.** ORIGIN; MOTHER'S CHIEF WORK; HOW THE CHILD'S INNER NATURE GROWS; WHAT PLAY MEANS; THE RIGHT KIND OF PLAY MATERIALS; GENERAL OUTLINE OF THE PLAY AND WORK OF THE KINDERGARTEN; VALUE OF MORNING TALKS; VALUE OF STORIES; VALUE OF MUSIC; VALUE OF GARDENS; THE "GIFTS" OR PLAY-THINGS OF THE KINDERGARTEN; WHY FROEBEL ORGANIZED PLAY-THINGS FOR THE CHILD; HOW THE KINDERGARTEN PLAY-THINGS HELP THE CHILD TO BE CREATIVE; EXPLANATION OF THE "GIFTS": First Gift; Second Gift; Teach Primary Forms; Form Combinations; Third Gift; Accuracy; Form and Measurement. VALUE OF THE OCCUPATIONS OR PLAY-MATERIALS; THE CLASSES OF WORK DONE BY MANKIND: Surface, Line and Point; Graphic Work. THE PLAY INSTINCT AND THE GAMES OF THE KINDERGARTEN: First Impressions; Group Play; Representative Games; Dramatic Games. SYMBOLISM OF THE KINDERGARTEN..... 19

\* "Bibliography of Kindergarten.—See under various headings and at close of section on Kindergarten.

**Part III. Primary Education.** THE CHILD AND HIS MOTHER; THE CHILD AND HIS FATHER; THE CHILD AND THE TEACHER; PARENT AND TEACHER; NATURAL UNDERSTANDING; HOME STUDY; WHEN THE CHILD FIRST GOES TO SCHOOL; COURSE OF INSTRUCTION IN LANGUAGE: First Year; Second Year. LEARNING TO READ—READING TO LEARN: Drill in Phonics; Eclectic Method in Reading; Story-Telling as a Language Exercise; Written Work; Reading to Children; Poems to Read to Children; Suggested Material for Help of Teachers; Books That Help in Story-Telling; Things to Be Remembered in Teaching Reading. LANGUAGE AND LITERATURE: Their Relation to Reading; Books for Children; Suggestions and Devices for the Inexperienced Teacher; Three Essentials in the Teaching of English; Suggestions for Seat Work; Children's Book Shelf; Helps for Teachers of Language and Literature in the Upper Grades. GEOGRAPHY: Home Geography; Commercial Topics Outlined; School Excursions in Europe; The Use of Text-Book; Pictures and Illustrations; Map Making and Map Study; Geography in the Upper Grades; Geography and History; Type Lessons; Books for the Study of Geography. NATURE STUDY: The School Garden; Its Value; How It May Become a Vital Part of School Instruction. ARITHMETIC: First Steps in Number Training; Developing the Idea of

Fractions; Seat Occupation for Number Work; Text-Book; Class Work; Typical Problems for the Grades; Suggestions for the Teacher of Arithmetic; Practical Helps in Arithmetic. ELEMENTARY AGRICULTURE: Topics for Autumn, Winter and Spring Months; Suggested Lessons for School and Farm; Exercises on Soil; Exercises on Plants; Outlines for the Study of Soil and Plants; How to Test Seeds; Tests for Seed Corn; Exercises on Fruit and Fruit Trees; Plant Diseases and Their Prevention; Farmer's Bulletins..... 27

\* "Bibliography of Primary Education.—Consult the various lists of books under section on Primary Education.

**Part IV. Secondary Education.** SECONDARY SCHOOLS; THE HIGH SCHOOL; COURSE OF STUDY: Language (*Ancient Languages*—Latin; Greek. *Modern Languages*—English; German; French); History; Science (*Biological Science*—Botany; Zoology; Physiology. *Physical Science*—Physics; Chemistry; Geology; Astronomy); Mathematics; Economics; Vocational Studies; Drawing and Design; Music; Physical Training; The Small High School; Teachers in Secondary Schools; New Community Ideals Needed; Social Life; Methods of Instruction..... 31

**Part V. Industrial Education.** MANUAL TRAINING FOR BOYS: Putting the Whole Boy to School; The Fruit; The Method; Where the Value Lies; Fundamental Rules; Not a Factory; Class Instruction; Shop Equipments; Materials Used; Schedule of Hours. MANUAL TRAINING FOR GIRLS: Needlework; Instruction Before Construction; Machine Work; Dressmaking and Millinery; Economy and Thrift; Equipment of the Sewing Room. COOKING AND HOUSEHOLD ARTS: How Not to Do Things; Housekeeping. CULTURE AND USE; VOCATIONAL TRAINING: Trade Schools and Trade Training; Private Trade Schools; Public Trade Schools; Cooperative Schools. THE MOST ESSENTIAL THING; TECHNOLOGICAL TRAINING..... 38

**Part VI. Normal Schools.** ORGANIZATION: Board of Management; Faculty. FUNCTION; TYPES; THE TWO PHASES OF WORK: For the Mature Student; For the Scholastically Trained; CONDITIONS OF ADMISSION; FORM OF ADMISSION; REQUISITES SECURED TO THE TEACHER: Spirit; Scope; Study of Man; Knowledge of Child Nature; RELATION TO THE PEOPLE; THE EXPANDING PROVINCE: THE COURSE OF STUDY: Minimum Course; Maximum Course; Professional Instruction; PRACTICE TEACHING..... 62

**Part VII. Higher Education.** ORIGIN AND PURPOSE; DEVELOPS POWER OF THINKING; PROMOTES SELF-KNOWLEDGE; PROMOTES FRIENDSHIP; GIVES FACILITY; LIFTS LEVEL OF SELF-DEVELOPMENT; PROMOTES HIGHER SERVICE; PROMOTES PROFESSIONAL INTERESTS; DE-

VELOPS THE GENTLEMAN; TRAINS FOR LEADERSHIP;  
USES TRUTH AND MEN; STIMULATES SOCIAL AND FRATERNAL ACTIVITIES; PROMOTES RESEARCH; CHOICE OF A COLLEGE.....67

\***General Bibliography of Education.**—Herbert Spencer: *Education*, Laurie: *Institutes of Education, and Studies in the History of Educational Opinion From the Renaissance*, Fitch: *Lectures on Teaching and Educational Aims and Methods*, Sully: *Teacher's Handbook of Psychology*, Lloyd Morgan: *Psychology for Teachers*, James: *Talks to Teachers*, Dewey: *Ethical Principles Underlying Education and The School and Society*, Butler: *Meaning of Education*, Horne: *Philosophy of Education and Psychological Principles of Education*, Bailey: *The Educative Process*, Munroe: *Source Book in the History of Education for the Greek and Roman Period*, Davidson: *History of Education*, Munroe: *Text-Book in the History of Education*, Quick: *Educational Reformers*, Brownson: *History of Educational Theories*, Adams: *Herbartian Psychology*, De Garmo: *Herbart and Herbartianism*, Hughes: *Froebel's Educational Laws*, Bowen: *Froebel and Education Through Self-Activity*, Butler: *Education in the United States*, Cubberly: *Syllabus of the History of Education*, Hall: *Adolescence and Youth—Its Education, Regimen and Hygiene*.

**Part VIII. Dictionary of Education and Educational Ethics.** ABSTRACT AND CONCRETE; ACADEMY: French Academy; British Learned and Scientific Societies; Canadian Societies; American Societies; Alexandrian Library; Alexandrian School; Alphabet; Analytic Method of Teaching; Liberal Arts; Attention; Authority; Bachelor; Belles-Lettres; Schools of Benedictines; Bible History; Brain; Business Colleges; Calisthenics; Carnegie Institution; Chautauqua Institution; Coeducation; College. COLLEGES AND UNIVERSITIES: Of the United

States; Colleges for Women; Schools of Technology; Foreign Colleges and Universities. COLLEGE FRATERNITIES: General Fraternities for Men; Fraternities for Women; Medical Fraternities; Legal Fraternities. Commencement; Convent Schools; Cooper Union; Correspondence Schools; Cramming; Deaf Mutes; Debating; Declaration; Dictation; Didactics; Discipline; Drill; Duty. OUTLINE OF EDUCATION. Elocution; Emotions; Emulation; Encouragement; Enthusiasm; Evening Schools; Faculty; Fellow; Genetic Method; Grammar Schools; Gymnasium; Habit; Humanities; Illiteracy; Illustration; Imagination; Individuality; Inductive Method; Instruction; Interest; Intuitive Method; Training of Judgment; Lecture System; Liberal Education. LIBRARIES: Public Libraries; Foreign Libraries; Libraries of the United States; Library of Congress. Manners; Memory; Mischievousness; Moral Education; Newspapers and Periodicals; Object Teaching; Order; Patience; Pedagogy; Peabody Education Fund; Perseverance; Phonic Method; Physical Education; Pictures; Play; Praise and Blame; Precocity; Psychology; Recitation; Religious Education; Rhodes Scholarships; Scholasticism; School Management; Self-Command; Self-Control; Selfishness; Slater Fund; Smithsonian Institution; Sympathy; Teacher's Institute; Temper; Temperament; Truthfulness; University; University Extension; Vanity; Pride; Self-Esteem; Voice; Will.....69

## BOOK TWO

## THE ARTS AND SCIENCES

**Part I. History.** DIVISIONS OF UNIVERSAL HISTORY: Ancient History; Middle Ages; Modern History; PARALLEL OUTLINES OF UNIVERSAL HISTORY. PARALLEL OUTLINES OF AMERICAN HISTORY: Prehistoric Period; Period of Authentic Discovery and Exploration; Colonial Period; Period of Union and Independence; Period of Confederation and Constitution; Period From the Adoption of the Constitution to the Civil War; Period of the Civil War; Period of National Expansion. HISTORY OF THE NATIONS: Abyssinia; Afghanistan; Argentina; Australia; Austria-Hungary; Belgium; Bolivia; Brazil; Bulgaria; Canada; Chili; China; Colombia; Costa Rica; Cuba; Denmark; Dominican Republic; Ecuador; Egypt; England; Germany; Greece; Guatemala; Hayti; Honduras; India; Ireland; Italy; Japan; Liberia; Luxemburg; Mexico; Monaco; Montenegro; Morocco; Nepal; Netherlands; Nicaragua; Norway; Oman; Panama; Paraguay; Peru; Portugal; Roumania; Russia; Salvador; Scotland; Serbia; Siam; Spain; Sweden; Switzerland; Turkey; United States; Uruguay; Venezuela. BATTLES OF UNIVERSAL HISTORY: Name; Date; Location; Contestants; Results. AMERICAN BATTLES: Name; Date; Location; Contestants; Commanders; Casualties. POPES OF ROME. RULERS OF THE WORLD: Roman Emperors; Kings, Emperors and Presidents of France; Sovereigns of Russia; Emperors of Germany; Kings and Queens of England. TREATIES

AND ALLIANCES. NOTABLE WARS OF HISTORY: Name of War; Cause of Conflict; Leaders; Chief Battles and Incidents; Results.....101

\***General Bibliography of History.**—Freeman: *General Sketch*, Haydn: *Dictionary Dates*, Rawlinson: *Manual of Ancient History*, Peck: *Harper's Classical Dictionary*, Danckert: *History of Antiquity*, Hirsch-Bey: *Egypt Under the Pharaohs*, Ewald: *History of Israel*, Allen: *Hebrew Men and Times*, Ranke: *Universal History*, Fisher: *Outlines of Universal History*, Mommsen: *History of Rome*, Gibbon: *History of the Decline and Fall of the Roman Empire*, Grote: *History of Greece*, Duruy: *History of Rome*, Merivale: *General History of Rome*, Lecky: *History of European Morals*, Italian: Middle Ages, Guizot: *History of Civilization*, Sybel: *History of the Crusades*, Cox: *The Crusades*, Emerton: *Medieval Europe*, Introduction to the Study of the Middle Ages, Harding: *Essentials in Medieval and Modern History*, Guerber: *Church History*, Alzog: *Manual of Universal Church History*, Clarke: *Events and Epochs of Religious History*, Fisher: *History of the Reformation*, Ranke: *History of the Popes*, Dyer: *History of Modern Europe*, Fyffe: *History of Europe*, Sybel: *History of the French Revolution*, Acton: *Cambridge Modern History*, Larned: *Topical Outlines of Universal History*.

**Part II. Language.** CLASSIFICATION OF LANGUAGES: Indo-European or Aryan Family; Semitic; Hamitic; Ural-Altaic or Scythian; Malay-Polynesian; Dravidian; Bantu; American; Australian; Isolated Languages; Universal Languages. PRACTICAL ENGLISH: Structure of Composition as a Whole; Structure of the Paragraph; Diction; Punctuation and Capitals; Proofreading; Argument and Debate; Forms of Public Speech; Journalism and Short Stories; Business English; Letters. DICTIONARY OF HOMONYMS; DICTIONARY OF WORDS FRE-

QUENTLY MISUSED; DICTIONARY OF PREPOSITIONS; DICTIONARY OF ABBREVIATIONS, CONTRACTIONS AND DEGREES; DICTIONARY OF FOREIGN WORDS AND PHRASES: From the Classic Languages; Modern Languages; Culinary Words and Phrases. . . . . 200

\* **General Bibliography of Language.**—Saxe: *Introduction to the Science of Language*. Whitney: *Language and the Study of Language*. Paul: *Principles of the History of Language*. Müller: *Science of Language*. Skeat: *Philology*. Jespersen: *Progress in Language*. With Special Reference to English. Giles: *Manual of Comparative Philology for Classical Students*. Oertel: *Lectures on the Study of Language*. Sweet: *Primer of Spoken English*. Skeat: *Etymological Dictionary of the English Language*. Sweet: *Grammar, Logical and Historical*. Whitney: *The Century Dictionary*. Webster: *New International Dictionary*. Fisk: *The Standard Dictionary*. Lewis: *Applied English Grammar*. Genuit: *Practical Elements of Rhetoric*. Gummere: *Poetics*. Wendell: *English Composition*. Jones: *Self-Cultivation in English*. Kittredge: *Words and Their Ways in English Speech*. French: *Study of Words*. Fernald: *Synonyms and Antonyms*.

**Part III. Literature.** GENERAL DEFINITION, ENGLISH LITERATURE: Anglo-Saxon Period; Norman-French Period; Elizabethan Period; Georgian Period; Romantic Period; Victorian Period. AMERICAN LITERATURE: Beginning of American Literature; Colonial Period; Period of Nation-Making; First Period of Nationalism; Second National Period. PARALLEL OUTLINES OF WORLD LITERATURE: From the Beginning to the Birth of Christ; From Jesus to Mohammed; From Mohammed to Dante; From Dante to the Reformation; Sixteenth Century; Seventeenth Century; Eighteenth Century; Nineteenth Century. DICTIONARY OF FAMOUS BOOKS, POEMS, AND DRAMAS; DICTIONARY OF LITERARY CHARACTERS AND ALLUSIONS; DICTIONARY OF PSEUDONYMS AND SOBRIQUETS; DICTIONARY OF MYTHS. . . . . 235

\* **General Bibliography of Literature.**—Jevons: *History of Greek Literature*. Mahaffy: *Greek Literature*. Crutwell: *History of Roman Literature*. Fortier: *History of French Literature*. Robertson: *History of German Literature*. Garnett: *Short History of Italian Literature*. Symonds: *Italian Renaissance*. Horn: *History of Scandinavian Literature and Jewish Encyclopedia*. Morley: *Library of English Literature*. Brooke: *History of English Literature*. Ward: *English Poets*. Gosse: *Short History of English Literature*. Tylor: *History of American Literature*. Matthews: *History of American Literature*. Steadman: *An American Anthology*. Johnson: *Elements of Literary Criticism*. Warner: *Library of Universal Literature*.

**Part IV. Science.** CLASSIFICATION OF SCIENCES: Concerning the Heavens; the Earth; Mass and Force; Molecules and Lesser Divisions of Matter; Living Organisms; Plants; Lower Animals or Concerning Man as an Organism; Man as a Member of Society; Exact Sciences. AERONAUTICS AND AVIATION: Table of Chief Events in Aeronautics. ASTRONOMY: Subdivisions; Solar System; Sun; Moon; Planets; Comets; Meteors; Stars; Nebula. BOTANY: Departments of Modern Botany; Cytology; Histology; Morphology; Physiology; Pathology; Ecology; Phytogeography; Phylogeny; and Taxonomy. Outline of Taxonomy, or Classification of Plants. CHEMISTRY: Substances; Physical Properties; Chemical Properties; Chemical Reaction; Molecular Hypothesis; Qualitative Analysis; Quantitative Analysis; Valence; Formulae; Thermochemistry; Electrochemistry; Photochemistry; Physical Chemistry; Inorganic Chemistry; Organic Chemistry; Chemical Elements. Chemistry of Foods. ENTOMOLOGY. ETHNOLOGY: Subdivisions; Origin of

Men; Unity of Mankind; Man's First Home; Migration; Races; Classification; Race Characteristics; Four Great Races; Geographical Distribution; Table of Ancient Human Remains; Table of European Peoples; Table of Asiatic Peoples. GEOLOGY: Departments or Phases; Agencies or Forces; Outlines. MINERALOGY: Relation to Geology; Classification of Minerals; Precious Stones. ORNITHOLOGY: Place in Natural History; Classification of Birds. PHYSIOLOGY AND HYGIENE: Cells; Muscular System; Osseous System; Nervous System; Sympathetic System; Foods; Circulatory System; Respiratory System; Excretory System; Reproductive System. HYGIENE: Cause of Sickness; How Disease Germs Are Scattered; Food as a Source of Infection; Disease Conveyed by Insects; Prevention of Disease; Disinfection; Purifying Water; Preventing Tuberculosis; Keeping Germs Out of the Body; Vaccination; Antitoxins; Pasteurized Milk; Mastication; PHYSICS: Electricity; Dynamo; Mechanics; Heat; Combustion; Light; Color; Sound. ZOOLOGY: Subdivisions; Table of Principal Groups of the Animal Kingdom; Protozoa; Metazoa; Mollusca; Anthropoda; Chordata. DICTIONARY OF ANIMALS. WEIGHTS AND MEASURES: Systems in General Use; English System; Metric System; Measures of Length, Capacity, Surface, and Weight; Measures of Time; Temperature Scales; Barometric Measurements; Weights and Measures of the Bible; Approximate Equivalents of Metric and English Systems; Force of Winds; Specific Gravity Table; Foreign Weights and Measures. . . . . 301

### BOOK THREE

## TRADE AND INDUSTRY

**Part I. Productive Industries.** AGRICULTURE: Oldest Form of Industry; Soils and Their Fertilization; Irrigation and Drainage; Tillage and Dry Farming; Status United States in Agriculture; Agricultural Education; Agricultural Colleges; Experiment Stations; Plant Breeding and Seeds; Horticulture; Animal Husbandry; Dairying; Veterinary Science. MANUFACTURES: Basic Industries; Materials of Manufactures; Power; Manufacturing Zones; Principal Centers; Exports; Manufacturing in United States Compared With Other Nations. MINES AND MINING: Fuels; Metals; Structural Materials; Chemical Materials; Miscellaneous Minerals. FISHERIES OF THE WORLD: Capture of Fishes; Salmon Fisheries; Lake Fisheries; Cod Fisheries; Deep Sea Fisheries; Fishing Nations; Artificial Hatchery. FORESTS: Lumbering; Forest Areas of Various Countries ..... 391

\* *General Bibliography*.—Clarke: *Art and Industry*. Koulion: *Economics of Manual Training*. Dapp: *The Industrial Element in Education*. Bailey and Miller: *Encyclopedia of American Horticulture*. Bailey: *Principles of Agriculture*. Wilcox and Smith: *Cyclopedia of Agriculture*. Miles: *Stock-Breeding*. Armsby: *Manual of Cattle Feeding*. Jordan: *The Feeding of Animals*. Wing: *Milk and Its Products*. Elliott: *Practical Farm Drainage*. Hunt: *Cereals in America*. Ure: *Dictionary of Arts, Manufactures and Mines*. Caulfield and Seward: *Dictionary of Needlework*.

**Part II. Business and Commerce.** Business Economics: Organization of Business Enterprises; Methods of Financing; Management; Distributive Industries; Wholesale and Retail Trade; Department Stores; The Foreign Market; Exporting; Importing; The Customs House; U. S. TARIFF LAW, TABULATED: Commercial Correspondence; Advertising; Salesmanship; Credit and Collections; Transportation by Land and Water; Corporation Economics. TABLE OF THE RAW MATERIALS OF COMMERCE: (1) Foods; (2) Beverages; (3) Spices; (4) Oils, Fats and Waxes; (5) Vegetable Fibers; (6) Woods; (7) Gums and Resins; (8) Dyestuffs; (9) Tanning Materials; (10) Animal Products; (11) Insect Products; (12) Mineral Products. Money, Banking and Finance: Functions of Money; Mediums of Exchange; Banks; Bank Notes; Exchange; Clearing House; Postal Savings Banks; Money Market; Panics; Foreign Financial Systems. Imports and Exports ..... 420

\* *General Bibliography*.—Ware: *Educational Foundations of Trade and Industry*. Webster: *General History of Commerce*. Mulhall: *Industries and Wealth of Nations*. Bolles: *Money, Banking and Finance*. Adams: *Commercial Geography*. Scott: *Money and Banking*. Walker: *Political Economy*. Carnegie: *Empire of Business*.

### BOOK FOUR

## UNIVERSAL GAZETTEER

**The Earth:** Form and Dimensions; Chemical Composition; Land and Water. **Oceans:** Antarctic; Arctic; Atlantic; Indian; Pacific; Islands; Marine Geography. **Continents:** Europe; Asia; Africa; North America; South America. **Countries of the World:** Abyssinia;

Argentine Republic; Austria-Hungary; Belgium; Bolivia; Brazil; British Empire; Bulgaria; Chili; China; Colombia; Costa Rica; Cuba; Denmark; Dominican Republic; Ecuador; France; German Empire; Greece; Guatemala; Hayti; Honduras; Italy; Japan; Liberia; Mexico; Monaco;

Montenegro; Morocco; Netherlands; Nicaragua; Norway; Panama; Paraguay; Persia; Peru; Portugal; Roumania; Russia; Salvador; Serbia; Siam; Spain; Sweden; Switzerland; Turkey; United States; Uruguay; Venezuela: Their Chief Dependencies: Tables of States and Territories: Table of Foreign Governments and Rulers; Table of the British Empire; Rivers, Lakes, Seas, Waterfalls; Moun-

tains and Volcanoes; Vegetable and Animal Life; Cities; Seaports; Climate and Productions; Table of World States; Census Statistics. LATITUDE AND LONGITUDE: UNITED STATES TRAVEL DISTANCES; CANADIAN TRAVEL DISTANCES; WORLD TRAVEL DISTANCES. . . . . 451

\* **General Bibliography.**—Blackie: *Imperial Gazetteer*. Longman: *Gazetteer of the World*. Lippincott: *Gazetteer*. Baedeker: *Guides*.

## BOOK FIVE

## ATLAS OF UNITED STATES

**List of Maps and Features:** Map of United States; MAPS OF THE VARIOUS STATES AND TERRITORIES: Alabama, Alaska, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island,

South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin, Wyoming. **INSULAR POSSESSIONS:** Hawaii, Philippines, Porto Rico, Panama Canal Zone. **CITIES AND ENVIRONMENT:** Chicago, New York, Philadelphia, Washington. **PANAMA CANAL ZONE; Important Railway Lines; Chief Commercial Centers; States Demarked Into Counties; Capitals and County Seats. . . . . 486**

\* **General Bibliography.**—Bartholomew: *Atlas*. Rand-McNally: *Atlas; Century Dictionary and Atlas*. Johnston: *Historical Atlas*. McClure: *Historical Church Atlas*.

## BOOK SIX

## DICTIONARY OF BIOGRAPHY

(Not in abridged edition)

**Literature:** Homer, Aeschylus, Sophocles, Herodotus, Demosthenes, Cicero, Vergil, Plutarch, Dante, Montaigne, Cervantes, Shakespeare, Milton, Moliere, Montesquieu, Voltaire, Lessing, Gibbon, Goethe, Schiller, Scott, Wordsworth, Balzac, Carlyle, Hugo, Emerson, Browning, Longfellow, Tolstoy, etc. **Fine Arts:** Phidias, Vinci, Michelangelo, Raphael, Titian, Rubens, Velasquez, Rembrandt, Bach, Handel, Mozart, Beethoven, Wagner, etc. **Religions:** Moses, Zoroaster, Confucius, Buddha, St. Paul, St. Augustine, Mohammed, Gregory VII., St. Francis, Luther, Loyola, Calvin, Wesley, etc. **Philosophy:** Socrates, Plato, Aristotle, St. Thomas Aquinas, Bacon, Descartes, Spinoza, Locke, Leibnitz, Hume, Kant, Hegel, Spencer, James, etc. **Science and Discovery:** Gutenberg, Columbus, Copernicus, Palissy, Galileo,

Kepler, Harvey, Newton, Linnaeus, Arkwright, Watt, Lavoisier, Cuvier, Stephenson, Morse, Darwin, Helmholtz, Kelvin, Edison, Bell, Marconi, Wright, etc. **Politics:** Alexander the Great, Julius Caesar, Charlemagne, Alfred the Great, Charles V., Grotius, Cromwell, Peter the Great, Franklin, Frederick the Great, Washington, Jefferson, Napoleon I., Webster, Lincoln, Bismarck, McKinley, Roosevelt, William II., Mutsuhito, etc. **Four Thousand Other Past and Present Leaders. . . . . 535**

\* **General Bibliography.**—Phillips: *Dictionary of Biographical Reference*. Vincent: *Dictionary of Biography*. Thomas: *Dictionary of Biography*. Appleton: *Dictionary of American Biography; Dictionary of National Biography; Who's Who in Great Britain; Who's Who in America*. Ruoff: *Masters of Achievement; American Statesmen Series; American Men of Letters; English Statesmen Series; English Men of Letters*. Smith: *Dictionary of Christian Biography*.

## BOOK SEVEN

## MULTIPLEX DICTIONARY

(Not in abridged edition)

**Special Features:** Concise Definitions of Carefully Selected English Words; Syllabication of Words; Pronunciation and Mispronunciation; Parts of Speech Indicated; Derivative Words Separately Defined; Synonyms and Antonyms; Proper Names Capitalized; Origin, Pronunciation, and Meaning of Geographical, Personal, and

Curious Names; Cognates in Other Languages of Personal Names. . . . . 685

\* **General Bibliography.**—Webster: *New International Dictionary*. Worcester: *Dictionary of the English Language*. Funk and Wagnall: *Standard Dictionary*. Whitney: *The Century Dictionary*. Murray: *Oxford English Dictionary*. Wright: *Dialect Dictionary*.

## LIST OF ILLUSTRATIONS

## Text Illustrations

MORNING IN THE KINDERGARTEN—THE TALK AND STORIES.

PLAY CIRCLE IN THE KINDERGARTEN.

CHILDREN'S INDUSTRIAL WORK.

CHILDREN'S PLASTIC WORK.

KINDERGARTEN PLAY-GROUND.

AGRICULTURAL, ARITHMETICAL, CHEMICAL, MUSICAL, AND INDUSTRIAL GRAPHIC CHARTS.

## Sepia Plates

COMPARATIVE GEOGRAPHY OF THE WESTERN HEMISPHERE:  
Mountains; rivers; lakes; islands; waterfalls.COMPARATIVE GEOGRAPHY OF THE EASTERN HEMISPHERE:  
Mountains; rivers; lakes; islands; waterfalls.

## PLANT LIFE I.:

Cotton, fruit and seed; Linden, flower and seed; Tamarix, flower section; Morning Glory, flower section, fruit and seed; Willow, flowers and seed; Juniper-pine, leaves, cone, and scale; Magnolia, flower section; Field Horsetail, plant form; Arisaema, stem, leaf and flower; Thistle, flowers and bracts; Flax, fruit and seed; Monarda, flower section; Poppy, flower section; Birch, flowers; Melon, flower section; Buttercup, section of flower, pistil, stamens, ovary, etc.

## PLANT LIFE II.:

Composites; Gagea, flower; Maple; Clove, flower section and fruit; Laminum, flower side and front; Streptanthus, flower section; Pepper, flower and fruit; Onocleas, flower section; Aralia, flowers; Cornus, flower; Clover Beech; Sage, flower and section; Oak; Peach, flower section; Saxifrage; Ash, spiralella flower; Grape, closed, opening and opened flower; Gentian, flower section; Chickadee, flower and fruit; Carnot, flower and fruit; Alfalfa.

## KINDERGARTEN GIFTS I.:

First gift, conveying the ideas of motion and matter.  
Second gift, matter and measurement.  
Third gift, length, breadth and thickness.  
Fourth gift, beauty forms.

## KINDERGARTEN GIFTS II.:

Fifth gift, conveying the ideas of dimension and form.  
Sixth gift, surface, line, and point.  
Seventh gift, contour by use of sand.

## AIR-CRAFT:

Farman's Monoplane; Maxim's Flying Machine; Montgolfier's Balloon; Santos-Dumont's Balloon; Zeppelin's Airship; Latham's Machine; Maxim's Model; Wright Aeroplane; The Farman Machine; Dapuy de Lemaire's

Airship; Parachute; Airship of Renard and Krebs; Wolfert's Airship; Chanute's Flying Apparatus; Glenn Curtiss' Machine; Langley's Flying Machine; Paulhan's Machine; Stanley Spencer's Balloon.

## THE HEAVENS:

Photograph of the Sun; The Moon, photographed at Lark Observatory; Star Nebula, Milky Way; Typical Sunspot; A Comet; Craters of the Moon. Highly Magnified.

## Color Plates

(Not all included in abridged editions)

## RACES OF MEN:

Akka (Fazm); Darfur Negro; Swahili (Hantu); Bechuana Girl; Bushman Woman; South Australian; Fujian (Malanesian); Pai Ute; Botocudo (South America); Fuegian (South America); Apache; Mongolian; Chinese; Gilyak; Korean; Japanese Woman; Sumatran Woman (Malay); Ratta of Sumatra ("Indonesian"); Eskimo; Caucasian; Samoan (Polynesian); Fellaah (Hamitic).

## FLOWERS, FUNGI AND GRASSES:

Pomegranate; Aroid; Giant Flower; Truffle; Wheat Rust; Oat Smut; Puff Ball; Mushrooms; Toadstools; Dye Fungi; Pickle Fungi; Orchids; Lily Cactus; Prickly Pear; Tall Cactus.

## MARINE LIFE:

Jelly-Fish; Cat-Shark; Tube Worm; Root of Jelly-Fish; Umbrella of Jelly-Fish; Crinoid; Squid; Sting-Ray Shark; Giant Perch; Lobster; Red Crab; Star-Fish; Mollusk; Sponge; Coral; Hermit Crab; Sea Anemones; Yellow Coral; Tube Worms; Sea Roses; Crabs; Cuttlefish; Sea-Trilobes; Horse Sea-Rose; Sea-Hare; Scallops; Nail Sea-Hare; Weaver; Sea-Cucumber; Skate.

## OBJECTS AND DESIGNS FOR PRIMARY WORK.

## ANATOMICAL PLATE:

Heart; Auricles of the Heart; Pulmonary Circulation; Portal Vein Circulation; Circulation of the Blood in the Body.

## DOMESTIC ANIMALS:

Hampshire Pig; Narragansett Turkeys; Poland Cock; Yellow China Fowls; English Thoroughbred; English Goose; Toulouse Goose; Plymouth Rock; Herd of Cattle; English Bantams; Southdowns; White Plymouth Rocks; Barred Plymouth Rock; Shetland Pony; Gold Bantam; Belgium Horse.

## WILD ANIMALS:

Gorilla; Ruffed Lemur; Vampire; Walrus; Cohago; Reindeer; Strout; Pea Weevil; Polar Bear; Squirrel; Hare; Anteater; Badger; Beetle; Indian Elephant; Aye-aye; Lemming; Wildcat; Dormouse; Tiger; Hedgehog; Marmoset; Armadillo; Lizard; Apple Weevil; Peewee; Hyrax or Damian; Snake; Lion.

## PAINTING:

Mrs. Siddons—Gainsborough; Mona Lisa—Vinci; Madonna del Grazi Dura—Raphael; Study of the Cloth Merchant's Guild—Rembrandt; Portrait of My Mother—Whistler; The Schoolmistress—Fragonard.

# FIELD OF EDUCATION

## THE END AND AIM OF EDUCATION.—

If the 15,000,000 children of school age in this country were placed in a solid line, it would extend from the northeast coast of Maine to the southwest coast of California, and according to Professor Snyder, all except those that stood in the latter state do not go beyond the grammar-grades. Worse than that, the majority of our citizens and voters have probably not gone much, if any, beyond the end of the sixth grade. Thus the problem of doing the most and best for the grammar-school children is one of profound national importance for the safety and welfare of our country.

The end and aim of education is to develop each individual to the most complete maturity of all the powers of the body and mind. In its larger sense, education begins at birth, or with the marriage of the parents, and we must not forget, that, besides the school, there are more than fourscore different types of child-welfare organizations that are essentially educational, dealing with health, morals, recreation, occupation, religion and all the rest.

An educational system naturally falls into four grand divisions: The first deals with the child up to the dawn of the teens; the second, or intermediate or high school, includes the early and the third, or collegiate, the later pubescent years; the fourth, or professional, deals with mature young men and women.

**Primary Education.**—The end and aim of primary education may be divided into (a) special, and (b) general. Under the first come reading and writing. The child who has mastered these arts has access to all the literature in the vernacular. He can transcend his own limits of time and space, and commune with the greatest minds that have left their written records and literature in any age or land. He can become a world citizen and learn from the printed page whatever he will about the life of his own community, state, nation, the world; and from this point on, in some sense, his education is in his own hands.

The point now to be stressed is how to insure that he will read the best, and not the worst, things in print. He has before him the world of letters and books. There is, alas, always the possibility that he will be degraded by reading what is vile and demoralizing, for there is printed matter which anti-vivisection societies destroy by the ton, which causes a moral decay that is impossible to those who cannot read. A graver danger, because one to which all are exposed, is that of spending their reading time upon the second or tenth best, for print now keeps alive masses of material which would have sunk to oblivion but for the printer's art.

**Good Books.**—Among the most precious educational agencies are those that determine the content of school readers, advise and list the best books and incite children to read them by means of story telling and libraries in the schoolrooms and arouse and direct the reading habit, which at about the end of the grammar grades

reaches the highest point of its curve. At this age, more boys, and especially girls, are liable to have reading grades than at any other. Hence some have gone so far as to advocate a kind of school Bible or canon so as to make certain that children shall know and feel the uplift of the greatest books that make the world's classic literature, in some epitomized form. By the aid of the story teller's art this ideal is no longer impossible. From the spontaneous reading interest of children, of which there are now several admirable special studies, it would appear that on leaving the grammar grades, each child should have some special reading interest and have acquired the habit of gratifying it in our now universally diffused libraries, to which most children have access.

**Arithmetic** is the door to mathematics. Although we have doubtless overemphasized it, it is essential that the child command the methods of ready and correct computation which are vital for every vocation. The simple rules of arithmetic and fractions, the laws and tables of mensuration, proportion, the elements of the roots and powers of numbers, with the elements of geometry, but not much of any algebra, should be attained. Fair penmanship and simple composition, with decent command of the English language, are of course essential. The movement to defer writing till the second grade, or the eighth year, is beneficent, and will do much to improve penmanship, while more oral and less written work will tend to give a better command of language, which lives, moves and has its being in the circuit from ear to mouth, and in a dead and lifeless thing on the long circuit from the eye that reads to the hand that writes.

**Nature Study**, a little school gardening and occupational work, rote singing, which should precede note reading by several years and which cultivates not only the voice but the heart, is now believed to be both possible and desirable for nearly all children.

**Geography** should begin with the knowledge of the immediate environment perhaps of the schoolroom and widen to the town, the state, the nation and the world, in concentric irradiation, with some map drawing and sand modeling, with industrial, commercial and transportation elements always stressed. This work can often be naturally connected with the industries of the locality, sources of raw material, markets for the finished products, and be helped out by regular school visitations to the principal industries of the town.

**History and Civics** are vital for citizenship. Both may well begin with the locality, with visits to the city hall and other, public institutions of knowledge, the historical monuments and their significance, and sentiments inspired by the flag.

Besides these, there should be a margin or fringe of accessory influences pervading the grammar grades. Arbor Day and other holidays should always bring their lessons. There should be, if possible, visits to the reformatory and charitable

institutions of the vicinity, and their lessons should be inculcated. Before leaving the grades, every child should have a good repertory of plays and games, and should have some practice in the elements of manual training as introductory to some form of skilled labor. The influence of the school house, room and yard should be made the best possible, and the personal influence of the teacher should culminate in occasional serious and carefully prepared talks upon life and its duties, obligations, social relationships.

At the very beginning of the teens, teachers and systems should recognize the marvelous expansion of energy and the new interests that are awakened and therefore the new methods that are necessary to enlist the best powers of the child.

**Intermediate Schools.**—Every community should have continuation schools to meet the needs of the thousands of children from thirteen or fourteen to sixteen who have left school and who cannot and perhaps should not find vocational employment. The needs of this class of children are now a great problem, and there is a growing consensus that industrial occupations should be provided for all who want them.

**Moral Instruction.**—In this critical period of life, habits that will endure are being formed more rapidly than any other. Morals need great attention. There is now a new awakening of the community to the dangers of sex errors, and the need especially for boys, if not also for girls, of some definite and personal instruction along these lines. It is when we consider this aspect of the subject that we realize most keenly the need of more male teachers, especially for boys who in these years experience, consciously or unconsciously, something of revolt against exclusively feminine control whether in the home or the school. Every boy needs a personal mentor such as the Big Brother movement contemplates. He also ought to be looked over by a vocation bureau and given hints at least concerning classes of occupations which he should avoid and those which he can hope to enter with some advantage.

**A Sound Body.**—Every school child should throughout this period have stated and repeated medical examination. The teeth at most always need attention and irremediable injury may follow if it is wanting. Ears and especially eyes should also be tested. The general condition of each child should be inspected and suggestions to parents and teachers made. In some lands a life and health book is kept, recording the observations of teachers, and the suggestions of physicians concerning regimen, diet, etc. Recent studies by the scores of hundreds show how many children are handicapped for life by defects that could be remedied and diseases that could be avoided. To this end, gymnastics, playgrounds, open-air schools, excursions, school meals, dietaries, free dispensaries and all the other health-giving agencies are now greatly desired.

**Secondary Education** proper has two ends: (1) to fit for higher institutions, and (2) to fit for life. These two ends are disparate, and should never be confused in the present stage of our educational development. There must be fitting schools, but on a liberal allowance, less than ten per cent of those who enter the high schools will complete college courses. Hence the high school ought to be the people's college, where the work of the grammar grades can be reviewed and much enlarged. At present, vast numbers who enter the high school leave it before the completion of the course, especially at the end of the first year. The high school is the most conservative of all our educational institutions. It is prone to ape the college in its spirit and methods. The ideal should be to fit the boy and maiden for the higher vocations of life. Chief stress should be laid upon the vast resources of the *English language and literature*. The reading habit should be conserved and made very extensive, and less intensive than at present. *History* should come down to the present time and discuss vital problems and questions that are now interesting men and women. There should be always an opportunity for modern languages, which, when taken, should be taught intensively, and with a view both to conversation and to some acquaintance with the masterpieces in each. Science should be stressed, especially in its applications which normally precede interest in pure science. Lessons should be taught descriptively and experimentally with far less stress than is now customary upon mathematical formulas, with plenty of the rich historical and biographical material in which it abounds. The story of modern science to the high-school boy and girl is normally a great romance, and scientific kites, aerial navigation, motors, the telegraph and the telephone, wireless telegraphy and the rest should have their place as great generators of scientific interest. There should be abundance of apparatus and charts and diagrams galore. A high school without these is almost a body without a soul. *Biology* should be taught, not first by the technique of the microscope, but from an economic standpoint. Pests, vermin, the life histories and instincts of the great groups of animals, beginning with those with which the pupil is more familiar, should be made the center; and technical terms, while necessary, should not be overemphasized or made too abundant. The mysteries of life, health, reproduction, and disease lie in this field and should be made the most of. Physiology should anchor in regimen and give a wholesome and intelligent interest in body keeping, regimen, exercise, etc., and should not omit temperance, the sex function, and other practical applications of its profounder principles. Citizenship here, too, should be emphasized. Individual duties to parents, teachers, fellow beings, to the city, state and society at large should be brought out in a large, general and comprehensive way. Specialization should be favored only in case of those who have pronounced tastes and attitudes in specific directions, and be, as a rule, more and earlier and far easier with boys than with girls. The latter should not only have opportunity to prepare for wage-earning occupations like stenography, typewriting, bookkeeping, dressmaking, millinery and the rest, but should have both opportunity and incentive for acquiring interest and facility

in domestic occupations. They should be taught the meaning of home industries and of domesticity, should have opportunities to learn the elements of marketing, cooking and personal and household hygiene. We have forgotten the educational value of the practical, which is in fact far greater than that of the purely theoretical. Utilities, therefore, in the high school should have a larger place than is now generally accorded them as compared to the abstract and scientific.

**Industrial Training** for the high-school grades should not be chiefly manual training, but more specifically vocational. The stated sloyd, wood and iron work that makes objects of little use makes little appeal, and the manual-training high school of the old type now seems likely to fade as compared to the more definite industrial courses which are already made possible in so many centers and which are likely to greatly increase in the next few years. The high-school graduate who does not go on should not be too proud to begin at the bottom of the industrial ladder and to acquire the educational advantages to help him advance up its rungs more rapidly than he would otherwise do. The first duty of the school under the new dispensation of education that now seems to impend is to teach at least every boy to be self-supporting, for only on this basis can he make a good citizen and develop further amenities and cultures. He must be able to do something that really earns wages, for this is one of the most quickening of all intellectual spurts.

The same is true to some extent for girls. **Collegiate Education.**—It is hard in the present confused state of competent opinion concerning collegiate education to define its aim with positiveness. We have here two ideals, and, indeed, two types of institution. In one, the theory of general culture predominates. The college graduate must be mature, intelligent, gentlemanly, must learn to know the resources of a vast variety of special cultures and to choose intelligently between them later. He must be humanist and scientist, idealist and realist; he must study the world, although at a distance and from the printed page, must accumulate wisdom that can be applied later, must push on in mathematics because this is now the language of all the exact sciences. He must know Latin if he is to be a biologist, physician, lawyer or clergyman, and Greek can do him no harm. He must be able to grasp the content of any book in at least French and German, and know something of the great movements of the world represented in these literatures. He must have a general knowledge of the history of the world in its different countries. In this field, a new demand is now laid upon the teacher of history. It is not enough to know the past, but with the opening of the Near and the Far East and with the widening of our own national interest to cosmic dimensions, one must know the great problems of present-day administration and policy; the present situation in China, Japan, Young Turkey, Persia, the Congo and Africa, and South America must make each a center of vital interests, so that when he leaves academic halls he will not only find himself abreast of the great interests now pending in these fields, but will have a deep wellspring of interest for them kindled in his own heart which will enable him to be a respectable citizen of the world as well as of his

own land. He must get in vital rapport with the great social, economic, charitable, and religious movements of the day, must know something of the leaders and of the arguments of both sides. Never was a present so absorbing; never were the questions of the great world so important for every part and member of it as now. Much might be said in favor of studying history backward at this stage of education, for it is just as logical to proceed from effect to cause as *vice versa*. Indeed, antiquity, full of interest as its departments are to the specialist, and rapid as is the progress made in unearthing the earliest stages of mankind's development, seems somewhat palling in interest before the multiplicity of new and pressing present issues. There is danger that the college graduate-to-day will be confused by the multiplicity of electives, and perhaps overwhelmed by a sense not of how much, but of how little, he knows, for with true education the latter grows more rapidly than the former; hence the necessity that the college teacher should be a man of wide learning and devoted to the development of general ability and information on the part of his students, rather than a too sharply trained specialist.

The other collegiate ideal is practical and vocational. Thousands of young men to-day in this stage of their preparation have decided upon their field of work, and are seeking the bachelor's degree in order to make themselves more proficient in it. If they contemplate the law, they study history and economics with special reference to the demands of that profession. If they intend medicine, biology and chemistry; and if the ministry, sociology and perhaps even church history and Greek and Hebrew are taken for the professional aids that accrue therefrom; if technology, the sciences it requires are stressed. These students are more alert, active, interesting, for they have really entered upon the fourth of general education.

**Professional Education.**—Here we have, first, the university that is devoted to the training of experts along specific lines. Its goal is not only to make men, but to add to the sum of human knowledge. Every doctor of philosophy preparing his thesis, desires to bring some brick, however tiny, to be built into the great temple of science, which is the sublimest creation of man. He wishes to be an authority in some field, however small, and not an echo. It is amazing to contemplate how many of the epoch-making discoveries of recent decades have been due to the splendid co-operation of young men, with their enthusiasm and energy, working with and under the direction of leading and inspiring professors. The development of education in this field since the epoch-making establishment of the Johns Hopkins University in 1876 has been one of the brightest chapters in our educational history. When we come to professional schools, we find that medical education has been vastly extended, and its methods improved, especially in the direction of the discovery of the causes of various infectious bacterial diseases by the methods of immunity and therapeutics. The clinical hospital work has greatly increased, and another great extension in this seems to impend in the direction of the understanding and better control of neuroses, and especially of psychoses, which just at present have not yet an adequate representation. In legal education, the case method has brought the greatest

reformation, and has made the study of law more concrete and definite. Here, too, as everywhere else, specialization is rapidly increasing because the domain has extended far beyond the capacities of any individual mind. In technology, too, great progress has been made in methods and matter. Courses have been enriched and condensed, and our schools

now turn out engineers that in many respects lead the world.

Theology, unfortunately, lags behind. It has, to be sure, been greatly quickened by new sociological studies and practical work, but it needs great extension, and more attention should be paid to psychology, or to the nature and genesis of the soul which the clergyman seeks to save.

## KINDERGARTEN

### AN EXPLANATION OF THE KINDERGARTEN FOR MOTHERS AND TEACHERS

**Origin.**—The first kindergarten was established by Friedrich Froebel, at Blankenburg, Germany, in the year 1837. The name *kindergarten* ("the garden of children") indicates the new psychological view upon which is built the system of education that has grown out of the kindergarten.

Believing that man and nature were both created by the same divine Being, Froebel felt that they must be governed by the same laws. He reasoned, that as the farmer puts nothing new into the seeds which he plants, but merely gives them the right kind of soil and the right care, keeping the weeds from choking them, giving them a sufficient amount of water and room in which to grow, putting poles or props for the tendrils of climbing plants to cling to, and loosening the roots to give more air and freedom for the growth of the plant; so, too, the parent or teacher could add nothing new to the child. He or she would merely superintend the unfolding of the child's inborn powers, and supply the suitable employment of those powers, so that they, by being rightly exercised, would grow as they were intended to grow by their Creator.

This now seems a self-evident proposition to the thoughtful person. But at the time of the founding of the kindergarten, information was considered as the one all-important thing in education, and the more information crammed into a child the better. This old and most erroneous view is now being superseded by the system of education which gradually grew out of the "kindergarten idea," so called, but which more properly should be called "the new psychological idea of education."

It has already been stated, that as all the plant was ever to grow into was already in the plant, so, too, all of the child's real self was already in the child.

**Mother's Chief Work.**—Therefore the intuitions were the true basis of education, and the understanding of what these intuitions are, and how to supply what they need, to strengthen them and make them develop aright, is the chief work of the parent as well as of the teacher. To say

that this revolutionizing the idea of "education" is making a mild statement of the changes which are taking place in the schoolroom and in the home management of children.

Pestalozzi, the Swiss reformer, from whom Froebel learned much, had already said that the inborn powers of the child were to be developed by exercising them. But Froebel, gifted with far deeper insight, insisted, that, as all the child's growth came from within, it must be *voluntary*. His deeply religious nature led him to see, that, as God was a Creator, and had created the universe out of His own inner Self, so man, made in the image of God, must learn to put forth his inner-self and to use his inborn powers, not mechanically, nor because such and such a thing was prescribed by some one in authority, but of his own free will, that is, creatively.

#### How the Child's Inner Nature Grows.

—It can thus clearly be seen that the basis of the kindergarten is distinctively religious, though in no sense of the word denominational. This deep religious view of the inner nature of man, as the "child of God" is to be found in all of Froebel's writings. (See *Education of Man, Pedagogics of the Kindergarten, Education of Development*, etc.) In fact, his writings cannot be rightly used unless it is realized that he is thinking of the inner-self of the child rather than of his physical body. Even when he is giving instructions as to how a child's body shall be exercised, it is in order that the body may become the better instrument by means of which this inner-self may express itself.

Perhaps this fundamental basic idea of the kindergarten may be more clearly understood if the same thought is expressed in psychological terms, as *Psychology* means the science of the soul, and deals with the law by which the soul (the spirit, or inner-self) grows.

A simple statement of this profound science is that "the child is a self-creating being." The process of self-creating is as distinct a process as is the law which governs the growth of the plants. Plants,

animals, and men, all created life, develop from within. The difference between the life of plants and animals and the life of man is that life in the former is unconscious life, and, therefore, governed by a law from without, whereas man life is a conscious life and is, therefore, governed by a law from within. *This conscious life is man's inner-self.* The process of self-development, or self-creating, is that this inner-self can separate itself from itself and yet recognise itself thus separated as self.

We are all of us dimly conscious of the process going on within us when "our higher self" reproves "our lower self," and we say "I was ashamed of myself," or "I said to myself, that's wrong," or, again, when a man's self-respect outweighs every temptation. One of Emerson's most famous sayings is, "Unless a man hath a will within him, you can tie him to nothing"; that is, unless the inner-self can control the inner-self no outward obligation is binding.

**What Play Means.**—This psychological insight showed Froebel to be one of the prophets or forerunners of the new world discipline, *psychology*, which is so rapidly changing not only our views of the nature of man and our method of education, but also our treatment of criminals, and our solution of many of the problems that have vexed the ages. Froebel shared this view of the nature of man with the leading minds of his age, but to him belonged the honor of first practically applying it to the training of young children. He insisted that *play*, or *voluntary* effort, was the most important activity of childhood; that in play the young child was uttering, or uttering his inner-self, and that therefore it was a *spiritual activity* inasmuch as it developed the child's consciousness of his inner-self, and of his power to express, or outer that self, and that this inner-self was what was meant by the Scriptures as "the image of God."

He urged always that the development of the consciousness of the self-making power of this divine inner-self was the end and aim of all education, inasmuch as it drew man near to God, and helped him to comprehend how all men were brothers, as they all have this inner-self, or "God-image" in them, with its limitless power of unfolding.

**The Right Kind of Play-Materials.**—This view of education caused him to search earnestly and thoughtfully, through long years of self-sacrifice and poverty, for the right kind of play and the right kind of materials with which to engage children's instinctive activity, for he saw that idle play and haphazard activities were not the truest and best means of educating and developing this inner-self or divine element in man; and yet he knew that the plays and the activities of childhood must

be simple and happy ones. It was his organization of the right kind of games and his creations of the tools of the kindergarten that constituted his most important work and showed him to be a genius—probably the greatest in the educational world.

**General Outline of the Play and Work of the Kindergarten.**—For the sake of more definite explanation of the activities that take place in a good kindergarten, the morning program may be considered under three general heads:

1st—*The Play-Songs*, or morning circle.

2d—*The Play-Gifts*, or table-work.

3d—*The Play-Ring*, or the games.

objects brought in by different children.

Under the same general head may be classed the excursions which a child and his mother, a single group, or sometimes the entire kindergarten may take to nearby places of interest where beautiful aspects of nature may be seen, or where some form of the work of mankind is going on, and the out-of-doors gardens of the children, and their play in out-of-doors sand pile.

Each of these activities has its own distinctive educational value, both in the home and in the kindergarten. But the materials used and the activities engaged

value have grown many of the improved methods now seen in our best schools.

**Value of Morning Talks.**—The morning talks in the kindergarten in which the children are encouraged to tell of their individual experience or to express in their own way their ideas concerning this or that object, picture, story, song, or other topic introduced by the kindergartner or some other child, are valuable because each child thereby gains fluency in self-expression through words. It has done much toward the advancement of the psychological methods of teaching reading and writing.

The words in printed books are no longer

MORNING IN A KINDERGARTEN—THE TALK AND STORIES

The first, the morning circle, varies considerably according to the needs of the hour and the interests of the children. Its chief purpose is to unify the group of children by bringing them into a common interest, or exercise. It includes conversations in which a child and his mother or a group of kindergarten children tell of their individual experiences, or listen to the experiences of other children, or of the kindergartner, the learning and singing of songs, the listening to wisely selected stories, the looking at and talking about pictures, also the examination of

in are less organized and more easily understood than are the *gifts* and *occupations* (or the table-work), or than are the kindergarten games.

Froebel's *Mother-Play Songs* and the explanations which accompany them, give a general idea of the various activities referred to in this first group and of their significance, although a mother in her home life with her children can do much that will be of great value if she has grasped the purpose of the above mentioned activities.

Out of a realization of their educative

drilled into the memory of first or second grade children, but reading and writing are made a means of self-expression on the part of each child and of getting the self-expression of the other members of his class. This has produced the method of introducing many short sentences written on the blackboard by the teacher. "Little stories," the children call them.

They are accounts of some experience that they have had in common, the sentences being composed by the children and written by the teacher, or short notes and letters written by the children and read by the

teacher, and various other exercises in which the difficult task of mastering the arbitrary signs (the printed words) is accomplished by an effort of the child's own inner-self to express itself by means of words.

**Value of Stories.**—Not only does the child grow accustomed to expressing himself in good, simple language in these conversations, but the earnest mother as well as the skilled kindergarten, knowing the power of the ideal to stir the emotions and arouse the imagination, uses these opportunities also for the telling of stories such as will quicken the right effort. Most of the kindergarten stories are symbolic rather than historical or informational, as the symbolic story contains an underlying truth, not expressed nor emphasized,

the Bible as Dean Hodges has told them can be told the five-year-old with profit and pleasure. The stories of the kindergarten by means of which the childish sympathy and imagination are quickened were the fore-runners of the "story hour" in the school-room, and, better still, of "the story-tellers' league," an after-school or holiday occupation in which first one child and then another tells a story, thus learning to express himself through the avenue of literature as well as to enjoy literature as an expression of the inner-life of others.

**The Value of Music.**—The joyous atmosphere of music and song, with which the kindergarten is flooded, has caused the thoughtful educators of older children to realize what an enormous instrument good music

developed into the recognized need of school gardens to such an extent that the agricultural departments of national governments are now giving generous aid to the establishment of the same. These modern developments in the educational world are spoken of here merely to make more clear the nature and value of the kindergarten activities, when understood and continued in more detailed form in the child's later school life, or in the home life, and they must not be taken as boastful and foolish assertions of the superiority of one stage or phase of education over another. They all belong to the new psychological era of education which realizes that the child must educate himself.

PLAY CIRCLE IN KINDERGARTEN

but merely embodied in the poetic form suitable to a child's stage of development, such as *Norse Stories*, by Hamilton Mabie; *The Wonder Book*, by Hawthorne; many of Grimm's *Fairy Tales* and the like. Almost all large publishing houses now have lists of stories of this kind.

Incidental stories are, of course, occasionally introduced. But the development of the child's powers of feeling, willing and thinking can best be aided by the presentation of ideals in the art form that the symbols of literature have furnished from time immemorial. This is what is here meant by "the poetic form" of literature.

Homer's *Odyssey* can be given quite early to a child. And the great hero-stories of

is for the development of and the giving expression to the right emotion of children of all ages. There are now many simple but good song books for children that any kindergarten supply store can furnish.

**The Value of Gardens.**—Gardens small enough and simple enough to be cared for by the children themselves are an essential part of the kindergarten system. Oftentimes this is only a few pots of plants or a small window box in which the children plant a few hardy, easily grown seeds, so that they may watch the mysterious growth of the same and thus begin to feel man's power to help or hinder the growth of nature. This care of a few plants has

#### The "Gifts" or Play-Things of the Kindergarten.

—The most distinctive and original part of Froebel's work was the creation of the *Gifts* and *Occupations*, or the *play-things* and *play-materials* of the kindergarten. They are almost limitless in their creative possibilities, and are closely allied to the more essential activities of mankind; and yet they are so simple that a child of three or four years of age can use them creatively. (See *Pedagogics of the Kindergarten and Reminiscences of Froebel* by Baroness von Balow.)

Comenius, the first of the modern educational reformers, made the astounding discovery that children learn more readily and more rapidly from objects than

from words; and for the first time in the history of the world, the insatiable "touch-hunger" of childhood was gratified by object lessons.

Pestalozzi, the great forerunner of Froebel, accepted the fact that self-development began with sensation; that is, he saw the value of letting a child see, hear, touch, smell or taste the things about him. And he added another important thing toward the right understanding of children, namely, he interpreted the ceaseless activity of children aright, as the indication of inner power, and realized that this activity could be used for their education instead of being rebuked and repressed. These two discoveries made a tremendous ad-

but tremendous work of developing the inner life of the child, that immortal part in which the divine Creator manifests the infinite power of his "image" in man.

**Why Froebel Organized Play-Things for the Child.**—But Froebel also realized that the myriads of sensations of motion, form, size, color, texture, weight, light, heat and the like, which poured ceaselessly in upon the mind of the child from the outside world, were too many and too complex to be grasped and assimilated. He realized, also, that the young child left unguided is as apt to attend to trivial or confusing sensations as he is to attend to fundamental and helpful ones.

full significance, he created and selected the playthings or play-tools of the kindergarten, which are so simple yet at the same time so suggestive that had he done nothing else they would entitle him to be recognized as a creative genius.

His selection of some and creation of other of these play-tools was based on the psychological explanations of God, Nature and Man. Briefly stated, his "World View" was this: he believed God to be the one Creator of all forces and phenomena of the universe, and he interpreted nature to be the uttering or utterance of God. The great divine Creator *in order to be Creator* must create or utter himself; in other words, that the divine Spirit must

KINDERGARTEN PLAYGROUND

vance in educational methods as well as in the better treatment of children in the home.

But Froebel's insight was far deeper and more fundamental than that of either Comenius or Pestalozzi. He realized the truth which has been accepted by most of the psychologists since his day, namely, that nature was the great awakener of the *inner life* of man; that through the senses came the summons from the outside world to the soul within to awaken and begin its effort to express itself. He realized that sense-perception was the stimulant which began not merely "the motor-reaction of the different nerves" but that through sensations, feeling, willing and thinking also began their subtle

As mere information is a secondary thing, the all-important work for the mother and kindergartner is to stir the right emotions, and then see to it that the voluntary effort awakened by the right quickening of feeling is genuinely put forth and, if possible, is brought to a successful result, as failure after genuine effort is hard to bear and often creates a discouragement which is injurious. This is one of the reasons why the work attempted, even the creative work voluntarily attempted, and the means employed should be simple and within the possibilities of the child's power to master.

With an intellectual grasp so great that the world has not yet realized its

manifest itself in an objective world. This objective world was nature. But to truly and fully manifest or outer himself, God must also create a creative being who could in his turn recreate and thus become the "image of God." This creative creature was MAN

In the kindergarten, therefore, emphasis is placed upon the child's doing original, creative work rather than upon copying the work of some one else. The all-important educational value is not that things shall be made, but that the children in making things shall learn the *process of making*. The thoughtful and earnest mother or teacher who takes time to really study Froebel's *Kindergarten*

# KINDERGARTEN "GIFTS." PLATE I

1. Gift first, conveys ideas of motion and matter.

2. Gift two, matter and measurement.

3. Gift three, length, breadth and thickness.

4. Gift four, figure-forms.

KINDERGARTEN "GIFTS." PLATE II

5. Gift five, dimension and form.

6. Gift six surface, line and point, by use of sticks, rings and seeds.

7. Gift seven, contour by use of sand.

*Gifts*, is filled with amazement and admiration at their simplicity and at the same time at the profound insight and significance which underlie them.

### How the Kindergarten Play-Things

**Help the Child to Be Creative.**—The three essential elements or factors that go to make up the material universe by which the child is surrounded are *motion, matter, and measurement*. (For a fuller development of this most interesting subject of the psychology of nature, read *Cosmos and Diacosmos* by Denton J. Snider).

After years of thoughtful contemplation and many unsatisfactory experiments, Froebel at last gave to the childhood of the race these "kindergarten gifts" or play-things which, when rightly used, lead the child easily and naturally into a familiarity with the essential factors of all creative work, and thus save him from the blundering and experimenting through which the race has learned to do its work.

**First Gift.**—For example, when the child is playing with the soft worsted ball and string (see Plate I) he naturally almost instinctively swings it back and forth, soon heaving it right and left, then round and round. Most children imitate the motion of objects about them. If they do not, the mother or teacher can suggest that the child shall try to swing one arm from back to front, from right to left, and round and round. Then the other arm. Then one leg, and then the other leg. This is excellent physical exercise for the child's body. If accompanied by some simple childlike song or rhythmically measured beat of time such as "tie-tac, tie-toc" or "here, there," it gives much pleasure to the child. But it does far more than this. These three movements, together with the rolling and bounding of the ball, familiarize the child, unconsciously of course, with the fundamental modes of *motion* of the universe and help him to classify and use them in his small world.

**Second Gift.**—Again, the kindergarten child plays with the two-inch wooden sphere, cube and cylinder, the second gift (see Plate I). These are the geometric type forms that underlie all form in the world of *matter*. They are not given as object lessons in geometry, but merely to familiarize the child in his play with the essential forms of the outside world, and to help him to instinctively classify under the broadest possible general heads the myriad forms with which he comes in contact, and thereby to select the more readily the form he may need in his play for this or that purpose.

**Teach Primary Forms.**—Being simple type forms rather than approximations of the type, they do not confuse him with the non-essential details. As, for example, it is easier to see the resemblance of an apple and of a pear to a sphere than to see the resemblance of the apple and the pear to each

other. Their difference in shape confuses their resemblance. So, too, it can more readily be seen that a barrel and a knitting-needle are each similar in shape to a cylinder (if the child knows what shape the cylinder is) than to trace their resemblance to each other. The difference in dimension and in general appearance confuses the impression of form. So, too, it is much easier to see that a box and a chair have the same general cubical suggestion than to see their resemblance to each other—and so on, with the many forms which children use in their play.

**Form Combinations.**—The pleasure with which children detect these approximations to the geometric type is an evidence of the help that they are getting in their mastering of the world of form. Rightly used, these three simple forms furnish an almost endless number of suggestions and combinations for play. As many as forty or fifty different games have been created with them by one class alone. As, for example, they can be put in a bag and the child put his hand in the bag and name some object like the form he has sensed, or a street roller can be made by combining the three forms, or ornamental gateway by using several of each form, etc.

But, of course, their chief educational value is that they help the child to classify form and thus advance him in the great world of form and all that depends upon the correct use of form.

**Third Gift.**—Again the divided two-inch wooden cube (see Plate I), being divided according to its length, breadth and thickness, brings to the child's notice, incidentally, the *axial planes* made by thus dividing the cube, and also the *diametral lines* and *central point*. These are the simplest and yet the most fundamental of all surfaces, all lines and all points with which the child will ever have to deal in the thousand-fold use of surfaces, lines and points in the workaday world. They are not given for the sake of geometric terms, but because they are the simplest and can be most readily understood and used in constructing and designing. As this two-inch cube of the "third gift" is divided into equal parts, from back to front, from right to left and from top to bottom, it necessarily falls into eight one-inch cubes. Thus the child has for his familiar plaything the simplest possible form by means of which the great cosmic element of *measurement* can be given to him.

**Accuracy.**—The value of establishing the habit of accurate measurement can hardly be overestimated. By means of it, all forms, all sizes, all proportions are known, from the orbit of the farthest star to the shape of the minutest crystal. Without the mastery of measurement all invention of the industrial world, all creations of

the world of art are crude and clumsy; and to the degree in which they are properly proportioned are they useful or beautiful according to the purpose for which they are intended. The child by means of these small one-inch blocks gets acquainted with the present unit of *measurement* of all Teutonic and Anglo-Saxon peoples.

**Form and Measurement.**—However, it must again be stated that this almost universal unit of measurement is not given arbitrarily to the kindergarten child, but incidentally. He plays with his one-inch blocks; the inch check on his kindergarten table is always before him; the one, two and three inch sticks, folding paper, and other "organized materials" of the kindergarten all help to lead him to measuring and to comparing proportions in his hand work. It has been found by experience that the use of this definite mathematical unit of measurement—the inch and its multiples—does not restrict the free creative expression of children, but aids it by helping them to escape from the confusion and vagueness of undefined proportions. It also leads them the sooner to feel (not to know or to analyze) the beauty of true proportion, which, after all, is but the right use of measurement by the skilled artist. To a somewhat older child can be given a carpenter's rule, or housewife's tape-measure for length and more exact measurements.

This simple device of dividing a two-inch cube into eight one-inch cubes gives to the child not only the fundamental perceptions of form and measurement, but it familiarizes him, also, with number, size, direction and the other principles of construction of all kinds, in their most easily mastered embodiment.

Therefore the child is led to use this "third gift" in three distinct ways by the kindergarten or the mother who has taken a little time to master it herself. He finds that with it he can build houses, tables, chairs or other "forms of life"; can inclose given space, can build up given heights, or place the blocks at given distances, can count by means of them, or even learn to put them together, or add to, take away or subtract one, two, or more of the blocks from the eight, to make squares or oblong forms with them, and thus begin all unconsciously and without sense of fatigue, or fear of strained attention, the great discipline which mathematics have given to mankind. These last-mentioned plays or exercises are known as "forms of knowledge," using that term in its larger sense. Again, the blocks can be placed so as to make symmetrical forms, where one side balances another, around a common center. Many pleasing changes can be made by turning all the corners to the center or

turning the edges to the center, or alternating. Such play with balance and symmetry is known in the kindergarten as "forms of beauty." But it does not matter much what any of them are called provided the mother or kindergarten realizes that she can lead her children to represent in a general way the objects about them or those of which they have a mental picture; that she can lead them to exact mathematical expressions by means of these same blocks; or that with them, she can induce her children to love the beginnings of the art world, which are repetition, balance and symmetry.

Other objects, such as buttons, pebbles, leaves, nuts, can be played with and arranged in harmonious designs, until the child learns to love symmetry.

**Value of the Occupations or Play-Materials of the Kindergarten.**—In addition to the *gifts* or *play-things* provided by Froebel for the kindergarten, there are the *occupations* or *play-material*, not yet formed into any definite shape. These give freer scope to the child's creative instinct—that all-important instinct by whose use the child comes soonest into the consciousness of his inner-self. The *play-materials* of the kindergarten are selected with regard to their formability, or the ease with which they can be shaped by the child into any form he desires or can be changed by him from one form into another.

Instead of forms already made, he now turns to creating or making forms after his own fashions; in other words, he begins to learn the processes by means of which the inner properties of matter may be discovered, tested and used. Tools are needed to thus transform the materials of nature, only the simplest of hand-tools, such as blunt-pointed scissors, paste brush, pencil, weaving needle, but these are an introduction to that great world of machinery by means of which man has freed himself from much detailed work which once enslaved him.

It must always be kept in mind that the educational value to the child of any kind of hand work is not the form made, but the process, the changing from one shape to another, as the real aim of such work is to quicken the feeling of inner power, the faint dawning of the realization that the inner-self can change and remake the outer world to suit its spiritual and material needs.

Out of this instinctive longing of every human being "made in the image of God" to re-create the world—and thereby to prove to himself his divine power, have arisen all the arts and industries of mankind. The arts of sculpture, of architecture, of painting, of poetry, of the drama, and of music have all grown out of man's spiritual need of expressing or uttering

his idea concerning the personal appearance of his God, the shelter fit for his God's abode, the language in which to worship his God, the form of worship that he deemed pleasing to his God, the sounds and gestures by means of which he could utter his praises and his petitions. All the "fine arts" were, therefore, an effort to express the beautiful, the perfect, the divine.

The industries, or "useful arts," arose not so much from man's need of food, clothing, and shelter (which is the usual reason given for their origin), as that by having food, clothing, and shelter man would be freer to go forward with his higher development, namely, the calling forth of his own inner life and the inner life of his people. When the end is merely the getting of food, clothing and shelter, it is not educative, it does not develop the divine nature of man.

Of course, this was not consciously realized by the early race, nor should it be realized by the child. He is led to make "something pretty" or to make something that he can use in his play, or that can give pleasure to some one he loves. But the mother or teacher is to see to it that the materials furnished and the processes taught are simple enough for the

of man those most typical of the processes by which the materials of the earth had been formed into shapes to serve man's purpose.

**The Three Great Classes of the Work Done by Mankind.**—The occupations of man, broadly speaking, may be classified as *plastic*, *industrial* and *graphic*. In order that the child may begin, in his play, to get some idea of the *plastic* process, or shaping from without, which covers so many of the occupations of man, Froebel selected sand and clay, the two simplest of moldable materials. These the children of the kindergarten at first mold and press and pat into endless forms with their hands (man's first tool). A little later they are given hollow forms with which to mold wet sand and a simple wooden modeling tool with which to carve and shape their clay. Any one who has ever watched the delight they take in such occupations will wonder why digging in the sand and making mud pies, activities of childhood as old as tradition, were never before the time of Froebel elevated into educational instrumentality.

**Industrial Work.**—To help the child understand *industrial* process, or the taking apart of the materials of nature and the putting of them together in man-made fashion, Froebel selected paper

CHILDREN'S PLASTIC WORK

child to make and remake with ease, as it must always be remembered that it is the *power to make* rather than the thing made which is of real value. Froebel, true to his insight that from the beginning of time man had been striving to attain this power to re-create the created world, selected from the innumerable occupations

of various degrees of thickness, which the child could learn to bend and fold into countless shapes, to prick with pricking needle, to cut apart, to fasten together again by means of intersecting planes, by weaving, by tying with string, by sewing with thread, or, sometimes, by pasting. The giving of too difficult materials, such as

CHILDREN'S INDUSTRIAL WORK

wood, tin, or leather, is apt to discourage the childish effort to reproduce the industrial process of the world, and would, therefore, hinder rather than help him in the learning these great processes by means of which most of the commercial activities of mankind are carried forward.

**Surface, Line and Point.**—In the industrial process of mankind, the surface, line, and point are the three essential elements used, no matter what kind of material is to be taken apart and put together in new shapes. Therefore the industrial occupations of the kindergarten include play with *points* by means of dotting, perforating, and cutting with scissors (as the cut line is but the succession of separating points)—as for example, pictures can be outlined on paper with a large pin; play with *lines* by means of weaving, intertwining, and sewing; play with *surfaces*, as in the fastening of surfaces together by interweaving, interlocking, and sewing, paper folding, and what, for the want of a better term is called "construction work," or the outlining of solids by means of surfaces. This process takes on many varying and interesting forms (see *Genetic Construction*, by Jessie Davis).

**Graphic Work.**—To help the child understand

the *graphic* process, or the representation of solid bodies upon surfaces (ordinarily called drawing), which is the third great division of man's creative, or remaking activity, the child is given chalk and blackboard, pencil and paper, or paint brush and water color paints and paper. This graphic process, or drawing with pencil or brush, calls forth the greatest amount of creativity on the part of the child inasmuch as it is the freest from the necessary limitations of all materials. With a bit of chalk, or a pencil, a child can reproduce a stone, a tree, a horse, a man, the earth, the sea, the sky, the moon, the stars, or anything else in the universe that has impressed him, and this, too, with less use of external material than was called for in his play with blocks, clay or paper. The mother or teacher must keep in mind that it is not how well the picture

is made that is important but that the *child shall be genuinely expressive of himself* by means of drawing, as for example, X meant to a three-year-old child "heaven, where the little angels play (above the slanting lines), and earth where the little children play (between the lines), and fairyland where the little fairies play" (below the slanting lines).

The mastering of the materials of nature in childish fashion, of course, begins with the very simple, and slowly adds the somewhat more difficult and more developed forms of hand-work in both the "gifts" and "occupations," so as to keep pace with the inner growing power of the child to use materials. If rightly understood both can be used advantageously by children much beyond the kindergarten age. For fuller explanations of the kindergarten gifts and occupations, the reader is referred to Froebel's *Pedagogics* and Dr. Snider's *Psychology of the Kindergarten Play Gifts*, chapter III, also to an excellent and practical book now in preparation (1910) by Miss Jessie Davis, entitled *The Kindergarten Occupations*, and Elizabeth Harrison's book, entitled *The Kindergarten Building Gifts*.

In learning to draw, the child is first

given chalk and board, or pencil and paper and allowed undirected use of the same. He begins aimlessly at first, but with great delight to mark dots, lines, and scribbling tangles of lines, but he soon tires of this and tries to represent some object. He is now ready to begin the organized drawing. The checked surface is given to him to guide his pencil. When he can consciously draw a straight line, a slanting line, a curved line, and lines of different lengths, the checked surface is discarded, and real drawing, albeit crude in form, begins.

Thus it will be seen that the playthings and the play materials furnished by the kindergarten for the child are not capricious toys nor haphazard materials, but are selected with the larger view of man's real significance in the universe as the creative child of God.

**The Play Instinct and the Games of the Kindergarten.**—What usually most attracts the looker-on in the kindergarten is the play circle or play ring. The attraction comes rather more from the unconscious grace which is so charming in children when at play than from any intellectual grasp of the real significance of play. Yet a definite advance was made in education when it was realized that play was the most natural and the deepest activity of a child between the ages of three and six and therefore the most educative.

**First Impressions.**—Until a child is about three years of age, he is absorbing impressions from the outside world, is learning how to use the various parts of his body—how to sit alone, to creep, to stand, to walk, to run, to climb, to grasp things, to pull, to drag, to tear, to understand the meaning of words and to speak words, as well as to dimly understand the law that governs solids by throwing things on the floor, by letting and pour through his fingers; to understand the law of liquids by splashing in his bath tub, by dabbling in bowls of water, by pouring water into and out of a vessel, by wading in shallow water, by the thrilling play with soapbuds if that great privilege is allowed him. He is testing the law of balance by balancing his own body in dangerous positions, by piling up blocks, books or other objects, and knocking them down. He is beginning to test space by creeping from one place to another, by pushing himself about by means of a chair, by almost senseless trotting about when he has once learned to walk; by adventuring beyond the home gate, sometimes to the horror of his mother.

All through these precious years he is growing, is strengthening his muscles and coordinating them so that they will work easily and readily together. He is testing his senses, and increasing their keenness and accuracy. He feels everything he can lay his hand on. He stares at all objects,

He listens to sounds and tries to reproduce them. He smells and tastes all sorts of things and the unthinking mother says "I never saw such a child, he is into everything. The moment my back is turned he is into mischief," whereas, in reality, he is only preparing himself to live; exercising and strengthening his body, testing the properties of matter, and finding that he can master the materials about him—make them roll, bend, twist, or tear, as the case may be—and that he can express himself by means of them. During this all-important period of life he is largely absorbed in himself and his mother or nurse, who to him is simply his helper, and he should be left as much as possible to this self-training. It hinders these first precious years of growth to have many people about an infant. It confuses him to have many changes made in his surroundings. Therefore it is harmful for young children to travel much or to have much excitement. They need a long, slow, quiet babyhood—healthful and happy with gentle "mother-play" to guide and direct. (Fröbel's *Mother-Play Songs* are as yet the best illustrations of the kind of baby-play that has been given to the world.)

But, at about three years of age the imagination begins to more definitely develop, and the social instincts begin to demand the companionship not so much of adults as of other children with about the same capacities and like interests. Almost all children, at this stage of development, make friends easily with other children. This desire for companionship of their peers and the impulse to put forth in play their inner life are as natural and as essential for fuller growth as was the absorbing in the previous period. It is at this stage that the organized play of the kindergarten supplies the needed form of activity. For the child prompted by growing imagination to seek self-expression and companionship should not be left to develop that divinely given imagination in capricious or wrong directions. It is here that the remarkable insight of Fröbel is again shown. Children have played since the beginning of recorded time—probably long before that—and certain vague ideas of guiding their play have been in the minds of men since the time of Plato. But it remained for Fröbel to regularly organize and establish play as part of the education of the child as soon as the social instinct is strong enough to desire companionship.

**Group Play.**—A mother can do much in the way of education by play with her child in the home. But the play will lack an important part of its real value unless it is joined in by other children. This kind of play is known as "group play," or in the kindergarten as "the play-ring," inasmuch as in the kindergarten the children usually gather together for their play in a circle,

thereby avoiding crowding and undue pre-eminence of any one child.

#### Characteristics of Kindergarten Games.

—The distinctive difference between the kindergarten games and the ordinary "street games" or "traditional games" is that the latter are often vague and aimless—sometimes even coarse and vulgarly suggestive. Many of them come from the idle and degenerate court-life of the past, drifting down through court servants to the peasantry of European countries and transported to America by them, whereas the kindergarten games retain the song, the repetition of the words and the rhythm that have made the traditional games attractive but put a new and better content into the play, keeping it free and childlike.

The games of the kindergarten usually begin with simple rhythmic movements of the body in time to music, either sung, or played upon a piano or other musical instrument; simple marching or hopping or skipping helps the child to definitely control his legs, catching and bounding a ball in time to music helps him to get definite control of his arms; simple childlike dances or rhythmic skipping with other children help him to get control of the whole body.

In what are known as "guessing games" one child leaves the room while the others decide on some one object that he is to discover by having described to him its properties—such as shape, color, texture, etc., or by the sound it can produce, or by some other testing of the senses of the

**Representative Games.**—Then come games in which the children represent with their arms a windmill, or the pendulum of a clock, or flying birds, or some other objects; or with their legs, pawing or galloping horses, jumping frogs, running fowls, or some similar activities. These are the beginning of the dramatic play which is so prominent a feature in the kindergarten. The instinct which makes all children reproduce in mimic play the activities of the world about them is the most important factor in a child's development, as it is the effort of the child to understand the actions of the world around him and a putting forth on his part of his inner impressions of the same.

**Dramatic Games,** in which the children impersonate first one and then another form of life, if wisely guided, are of inestimable value. They direct the child's attention aright and awaken his interest in the things which will be helpful to him; and by means of the right kind of dramatic play, a love of right doing and a dislike of wrong conduct can be aroused without any moralizing or awakening of morbid self-consciousness, which is so baneful to child life.

The dramatic games of the kindergarten, in which a group of children join together in one play, are based on those activities of the race which have been fundamental in lifting man out of his savage, half-animal state into civilized conditions. These are plays and games that dramatize family life by playing the protecting care and love of mother and father bird, or animal, and later

CHILDREN'S INDUSTRIAL WORK

child, who is then recalled and is expected to guess the object.

Soon are introduced more active games, depending on the cooperation of the whole group of children, such as marches, ring games, visiting games, and so on. (See Fröbel's chapter on "Play" in *The Pedagogics*.)

by playing the human activities of the home life. All children love to play father and mother and baby. It is this instinct which is understood and used aright in play. Again, all children love to play the activities of the economic world around them. They play they are baking or sewing, sweeping or dusting; dressing and undress-

ing doll-babies; or they are plowing, or reaping, or driving; or they are blacksmith pounding, or carpenter sawing or nailing, or any other activity of the world by which they are surrounded. Of the multitude of such activities the kindergarten selects the most essential in the production of food, clothing and shelter, and with the children she plays them zealously and in earnest if she is a good kindergarten. Later come the games that give the child in a less degree some idea of the state and the church, so that in the course of a year the little future citizens have played themselves into a dim consciousness of the great world of "ethical institutions" that surround and guard them and into a knowledge of which they must sooner or later come. Upon a right understanding of the laws that govern this ethical life of man depends so much of happiness or misery that the value of early learning concerning the same by means of play which attracts can readily be seen. But this play must always be kept joyous and childlike. That is the art of the kindergarten and it is a supreme art, inasmuch as it molds human souls and builds up beauty and nobility of character.

The games of the kindergarten have led to the introduction of dramatic play in the primary and advanced grades of the public school, and the simple rhythmic exercises have caused a general awakening to the consciousness of the meaning and value of the "folk dances" of primitive people. Discrimination, however, should be made between the early dances of nations that have developed into civilization and those of primitive tribes and races that still remain in savagery or barbarism. The latter contain little or no educational value, whereas the former were the primitive or childlike utterances by the founders of great nations of their feelings, by means of body gesture, rather than of defined thought.

These dramatic games and folk-dances have done much toward the right physical development of older children's bodies, and have also diminished the idle lounging and rough—frequently brutal—scuffling so often seen on school playgrounds. But their deeper significance as a means by which the inner life of the child can express itself is not yet fully grasped. It was the joyous play of the kindergarten that first deeply interested the Empress Frederika of Germany in the kindergarten, and later on caused her to have a portion of each park in Berlin set aside for a "spielplatz" or playground for the children, where sand-piles, swings, turn-poles, seesaws and other amusements are at hand to suggest some pleasurable and developing exercise. The idea has grown and spread until now there are hundreds of playgrounds in America alone.

**The Symbolism of the Kindergarten.**—But there lies a deeper meaning in the

kindergarten than merely the organization of the materials of nature and of human relationships, in order that the child may use the former creatively and the latter ethically, and so learn to live aright.

To Froebel, the chief aim of education was to obtain the right "world view" or the right idea of God, nature and man. In speaking of the organized gifts and games which he created for his kindergarten he says: "I have not only forms for the child's eyes which are to make him acquainted with the outward world which surrounds him. I have symbols which unlock his soul for the thought, or spirit, which is innate in everything that has come out of God's creative mind." (See *Reminiscences of Froebel*, page 210.) We have here the strongest and most definite statement of what is usually known as "the symbolism of the kindergarten." This phase of Froebel's work has been much misunderstood because it has been shrouded in mysticism by those who do not clearly understand the symbolizing power of the human mind. And yet, unless it is understood, one does not understand the full significance of the kindergarten.

Briefly stated, it is this: The inner-self, or soul, can only express itself and receive communications from other inner-selves, or souls, by means of a language created by itself. This the imagination of man creates for him by putting a new, or spiritual meaning into the images made in his mind by the sense-perceived world. For example, a mountain not only means, to the senses, a huge pile of rock protruding from the earth's surface, but it symbolizes to the inner-self great strength of soul; a dove not only means a small bird whose habits are peaceful, it symbolizes to the inner-self all gentle and kindly qualities of the human soul; warmth does not only mean the pleasurable sensation which the body receives from the rays of the sun, or from a fire, but it symbolizes to the inner-self enthusiasm, zeal and that earnest effort which is called "a warm interest in this or that." Men speak of "a square deal," of "a crooked life," "a bright idea," "a stinging rebuke," "a weighty matter," "a turn in affairs," "a strong grasp of a subject" and so on. All human language which pertains to anything beyond the mere animal existence of man is the result of this symbolizing power of the mind. All art is based on the fact that external forms, lines, sounds, etc., can be so used as to stir internal emotions. All religious rites and ceremonies are symbolic. Even the rites of baptism and communion of the Christian church are external ceremonies intended to symbolize the deep spiritual truths of the regeneration of the soul and communion with the divine. All that is meant by symbolization is the recognition of this power of the inner-self to imprint more than the outer-self can perceive

and to put its own meaning into the forms of the outside world.

Froebel perceived this natural symbolizing power in children and used it. He saw that what appeared as mathematical facts in the material world were analogous to, or suggestive of, the truths of the spiritual world. So the child playing with the mathematical laws feels the spiritual laws which they reflect. That which employs a child's activities interests him; what interests him he learns to like; what he likes he reflects in his conduct; what he does he becomes.

In playing with the essential elements of the created universe the child learns their laws and feels the inner law which they symbolize; as for example, playing with his box of blocks as a whole yet made up of many parts, each a whole in itself, he feels that he is a part of a larger whole of society, yet a distinct individual whole in and of himself. In his play he transforms one form into another and through familiarity with this simple external expression of evolution, he feels processes, the highest form of which is the great law of spiritual evolution, or growth. In his play of *The Bird's Nest* as he plays father or mother bird, or baby bird, he feels the universal relationship of family life. In his play with the materials furnished him he learns to find resemblances between things that seem to be entirely separated from one another; he learns to join opposites, and gradually he learns that there are no isolations in the universe created by the God "in whom we live and move and have our being." The failure to understand this phase of the kindergarten has arisen from the mistaken idea that the kindergarten was trying to teach the child to understand and to realize these deep spiritual truths, when she was merely giving him the external symbols which would arouse feelings for the same. (See Froebel's *Pedagogics of the Kindergarten*, the Baroness Marenholtz Von Blow's *Reminiscences of Froebel*, Susan Blow's *Symbolic Education*, Dr. Denton J. Snider's chapter on *Symbols in Psychology*, and Harrison's *Kindergarten Building Gifts*.)

In short the above may be summed up as follows: The child is led to exercise his creativity in order that he may, at first, feel and later on gradually come into a consciousness that there must be a creator, a maker behind all created or made things; and thus is met the deepest instinct of human nature—the longing to know God.

## PRIMARY EDUCATION

### IN ITS PRACTICAL RELATION TO PUPIL, PARENT AND TEACHER

Primary instruction very properly begins in the home. In no way can parents more helpfully cooperate with the school than by taking in hand the home-work, limiting it within reasonable time and holding the child to his best and most vigorous use of the time. In this way the home may supplement the school or become a check upon the school when such check is needed.

**The Child and His Mother.**—The world has recognized in art and story the sacredness of mother love. The intimacy of companionship between mother and child begins in the days of earliest infancy. We scarcely need Pestalozzi to teach us that in early education nothing can be compared with a mother's influence. The home training of a good mother is a preparation which sends the child out into life ready to profit by the best that life can give. The lullaby the mother sings her baby have in them more than calming into rest. "Sleep and rest, sleep and rest, Father will come to thee soon." They give faith in mother love and father care and lead to that larger faith which illumines adult years.

**The Child and His Father.**—In these days of prominence given to club life, and to "mothers' clubs" in particular, there is danger that the importance of a father's relation to the child be overlooked. The boy and his father, the father and his little companion daughter, these are comradeships that give the noblest impulses to home life.

It was a woman far past the meridian of life who wrote, "My most blessed memories are of my father. He was my first teacher and all through childhood he was my best friend. I learned to love whatever he loved and all that he loved was good and noble." Again a woman writes, "It is years since my father left me, but I can hear his rich voice now as he read to me out of my favorite books and gave me an introduction into the great world of his books." It is the father's privilege as well as the mother's to begin that nursery training that gives refinement and joy through all the coming years. What delight the child and father may have together as they wander hand in hand through storyland.

The father or the mother who is a good story-teller may be the child's greatest asset of bliss. The story hour may become not only the bright spot of the day but it may be looked back upon as the brightest spot of memory. Through the gentle art of story-telling the child may be given companionship and laughter and right teaching.

The ethical value of the story of moral conduct, the story that teaches without

seeming to instruct, is beyond any amount of deliberate argument—stories that inculcate the virtues of childhood, such as kindness, gentleness, obedience to parents, respect to the aged, honesty, self-denial, truthfulness, usefulness, sympathy. Stories of pure laughter are equally good, quick, responsive, joyous laughter. Oh, the merry heart of Eugene Field, and the merry heart of children who have laughed with him.

**The Child and the Teacher.**—It remains for an artist to express by brush or chisel what a noble-hearted teacher may become in the life of a little child—a radiance to guide throughout life. Such an influence was Pestalozzi, was Froebel, Arnold of Rugby, Horace Mann, Mary Lyon, Alice Freeman Palmer, and an innumerable host of others whose names are written in letters better than gold.

Superintendent Maxwell relates an anecdote of a teacher in his school, which shows the divine possibilities of such a worker. With the unmistakable Yiddish accent the Jewish mother exclaimed, laying a respectful hand on Miss K's arm: "I cannot help seeing how these children, they love you. You know my Bennie and Rosie? They're in your school. Do you know, lady, when you stand on that platform in the school and you say something it is just like when God speaks."

Owen Kildare gives a graphic account of the effect upon him of the first gentle touch he had ever felt. One day a strange woman, it must have been a mother or a teacher, patted him on the cheek and he tells us that he almost cried for joy. "With a light pat on my cheek and one of the sunniest smiles ever shed on me, she put a penny into my hand. She was gone but I realized what had happened. Somehow I felt that had she come back I could have said to her: 'Say, lady, I haven't got much to give, but I'll give you all my poipems, me pennies, and me knife if you'll do that agen.'" For such children it was written.

Give me no pity, but a place  
Where falls the sunlight on my face.

**Parent and Teacher.**—For the mutual helpfulness of home and school it is desirable that parents and teacher should know and understand each other better. Mothers are awakening to the need of child study and are appealing to teachers for guidance. Parents and teachers are seeking mutually for instruction and parent-teacher associations are formed. Through the intelligent direction of such organizations the school may arouse the home to a fuller sense of its duties toward the child's education, for often the ignorant or unthinking home is woefully lax. The physical and moral welfare of the child, through the

neglect of the home, must often become of the deepest concern to the teacher.

Moral development depends upon physical development. This means that the child's moral welfare must depend upon the economic conditions under which he lives, and just in proportion as we improve these conditions just to that extent do we increase the chances of the child to become a healthy, happy, moral citizen. No school has done its full duty unless it has aroused the entire community to a sense of its responsibility and acquainted it with the real meaning of intelligent cooperation in the training of children.

In some schools there are parents' meetings early in the fall for the purpose of giving teachers a chance to explain the studies to be taken up during the year, the method of procedure, the value of the subjects, and, if need be, the psychological reasons why particular studies occur at this point in the school course.

**Natural Understanding.**—The teacher should be intimate enough with the parent to talk candidly and freely about the interests of the child, and whenever peculiar conditions demand it, parents and teachers should together make a careful study of the nature and the needs of the child. Late entrance into school, irregularity of attendance, indifference to school work, physical defects, are important causes of retardation which can often be overcome to a great extent through intelligent cooperation.

No parent should trust for his understanding of the rules of discipline of the school to the fragmentary and biased account of a child's interpretation. It is a fine service to the school when parents can give the fact that the school exists for the sake of helping the child, and that the teacher is his good friend always.

The principal aid for children of incompetent homes must come from the school and the personal interest of the teacher. Of the worth of such a school and the method of such a teacher Judge Ben Lindsey has given this fine testimony: "Personal influence comes through personal contact, and since personal influence is perhaps the most powerful factor in moral or immoral development, there comes a grave responsibility to the teacher. With this responsibility comes also a great opportunity, that from the standpoint of service to mankind ought to be welcome, since there is no class of our citizens, not even parents themselves, who can do as are doing more to mold the character of the coming generations than the teachers in the schools."

**Home Study.**—The subject of "home study" has been regarded as so important that the National Educational Association gave it a place upon its program, and these are some of the points reviewed in round table discussion:

1. We must teach children how to study if we would secure the independence, concentration, organization, and persistence we desire.
2. Should children do any home study? If so, how much and when?
3. Parents should understand the aim of all home assignments and should agree with the teacher when the child should be given help in his work and where he should not.
4. Children get none too much sunshine as it is, hence the question of time for home study and time for play.
5. Children must be taught how to study, and this teaching should be by first guiding

them in pleasant work; then making them conscious of the process they are employing, noting its value and economy; third, arousing the will to do and to persist whenever desired; and fourth, selecting worthy subject-matter to give practice in the different fields—especially in concentration, persistence and independent thinking.

Home study fitted to advance this plan should in no way be detrimental to a child nor should it tax a parent unduly.

The following facts as formulated seem to be quite generally accepted: Children in the first four grades should be required to do very little, if any, study at home. The time out of school should be devoted to playing, occasional reading, and a little helpful service at home.

The children in the fifth and sixth grades should be required to do systematic reading at home under the direction of the

teacher. Such reading should be closely related to the study of subjects in geography, history and literature.

The children in the seventh and eighth grades should be required to study one subject, as history, at home, and also to do systematic reading which should be closely correlated with the subjects taught in school. The home reading should be carefully selected, and graded as the subject-matter of the regular course has outlined.

**WHEN THE CHILD FIRST GOES TO SCHOOL.**—For most children the first grade is the first year in school, as the majority of children cannot attend the kindergarten. The program of the first year should be organized to meet the needs of the six-year-old child so that he may adapt himself to the life of the schoolroom as comfortably as possible. Ample opportunity should be given for outdoor exercise and physical

development. The program of the first year work should include nature study, music, and handwork, language, reading, phonics, spelling, writing, some simple number work, not taken as separate and distinct subjects, but each illustrating and emphasizing the others, and all uniting to enlarge the child's experiences, to stimulate his curiosity, and to organize his knowledge. These subjects should be so arranged that they unify knowledge.

**Course of Instruction in Language for the First and Second Years.**—The following outlines of instruction for the first and second years in school are of the state of Illinois. They are arranged for the successive school months, have been adopted by a number of states and are among the best and most complete courses that have been worked out for the guidance of teachers. The course is adopted here without apology, because of its excellence.

#### FIRST YEAR—First Month

SUBJECTS	SELECTIONS FOR STUDY	SOURCES OF MATERIAL	PUBLISHERS
1. Original statements about the home of the child; its general appearance, its furniture, decorations, utensils and dishes. The occupations of the home.			
2. Nature stories.	The wee, wee man. Golden-rod and aster.	Cat Tails and Other Tales. Cook's Myths.	Flanagan. Flanagan.
3. Stories for telling.	Stories of the little red hen. Baird the beautiful.	Appleton's First Reader. Cook's Myths.	Appleton. Flanagan.
4. Mother Goose melodies.	This is the way we wash our clothes; London bridge; Pease porridge hot; Humpty Dumpty.	Nursery Rhymes.	Heath.
5. Fables.	The crow and the pitcher; The fox and the grapes.	Æsop's Fables.	Ginn.
6. Poems.	September; Golden-rod. The Noah's ark. To a honey-bee.	Nature in Verse. Pyle's Prose and Verse for Children. Alice Cary.	Silver-Burdett. Houghton. Houghton.
7. Songs to be memorized.	Autumn flowers. Golden-rod is yellow; The leaves party.	Songs in Season. Gaynor's Book.	Silver-Burdett. Silver-Burdett.
8. Picture study.	The cat family.	Adams (Perry Pictures).	Perry Picture Co.

#### FIRST YEAR—Second Month

1. Talks about the occupations of the father; his work and its purpose.			
2. Nature stories.	How Dame Nature got her frost; Seedlings on the wing; Clytie.	Cat Tails. Cook's Myths.	Flanagan. Flanagan.
3. Mother Goose melodies.	Old King Cole; One, two, buckle my shoe; If wishes were horses; Birds of a feather.	Nursery Rhymes.	Heath.
4. Fables.	The dog and his image.	Baldwin's Fairy Tales and Fables.	American Book Co.
5. Poems.	October's bright, blue weather; October's party; Lost, the summer; How the leaves came down. The rockabye lady.	Nature in Verse. Field's Poems of Childhood.	Flanagan.
6. Songs.	Come, little leaves. Farewell to the birds. Good-bye to summer. The woodman; The shoemaker.	Songs and Games for Little Ones. Gaynor. Eleanor Smith (II.).	Silver-Burdett.
7. Picture study.	Squirrels. The balloon.	Perry Pictures. Dupré.	

#### FIRST YEAR—Third Month

1. Getting ready for winter in the home. Laying in stores of food, fuel and warm clothing.			
2. Nature study.	The vapor family.	Cat Tails.	Flanagan.
3. Stories for telling.	Little Tuppen. History stories: Story of the Pilgrims, the first Thank- sgiving day; How fire came to earth.	Baldwin's Fairy Tales and Fables. Judd's Classic Myths.	American Book Co. Rand-McNally.
4. Mother Goose melodies.	Pussy cat, pussy cat, where have you been? I love little pussy; Little Boy Blue; Little Bo-Peep.	Nursery Rhymes.	Heath.
5. Poems.	November. Thanksgiving. The day is done. Jack Frost.	Alice Cary. Lydia Maria Child. Longfellow. Nature in Verse.	Farker's Classics.
6. Songs.	Thanksgiving song; November; Song of the nut. Jacky Frost; The farmer and the seller.	Songs in Season. Eleanor Smith (II.).	Flanagan. Silver-Burdett. Silver-Burdett.
7. Picture study.	Brittany sheep.	Rosa Bonheur.	

## FIRST YEAR—Fourth Month

SUBJECT	SELECTIONS FOR STUDY	SOURCES OF MATERIALS	PUBLISHERS
1. Preparation in home, school, and stories for Christmas.			
2. Nature stories.	The fairy Mercury; What the fire sprites did.	Cat Tails.	Flanagan.
3. Stories for telling.	St. Christopher; The Christ child. Christmas in other lands. Tiny Tim. The fir tree. Holy night.	Andreae Hufer's <i>Proudfoot</i> . Plan Book. Dickens. Hans Andersen. Mansel's <i>Child Stories</i> .	Flanagan.
4. Mother Goose melodies.	This little pig went to market; Mary, Mary, quite contrary; Hush-a-bye baby on the tree top; Ding dong bell, pussy's in the well.	Nursery Rhymes.	Heath.
5. Songs.	Away in the manger. Christmas carol. Why do bells for Christmas ring? Shine out, O blessed star.	Luther's Hymn. Gaynor's Book. Field.	Silver-Burdett.
6. Poems.	'Twas the night before Christmas; Hang up the baby's stocking; Little fir trees; The strange child's Christmas.	Whittier's <i>Child Life</i> .	Houghton.
7. Picture study.	Murillo's Holy Family; Sistine Madonna.		

## FIRST YEAR—Fifth Month

1. Winter sports. Animal life in winter.			
2. Nature story.	What broke the china pitcher?	Cat Tails.	Flanagan.
3. Stories for telling.	Story of the three bears; The little match girl. Farmer and The story of the year. Thor and his hammer. Lady Moon.	Classic Stories. Bevernson. Andersen. Foster and Cummings' <i>Asgard Series</i> . Whittier's <i>Child Life</i> .	Flanagan. Silver-Burdett, Houghton.
4. Mother Goose melodies.	Sing a song of sixpence; Baa, baa, black sheep, have you any wool? Three little kittens; There was an old woman who lived in a shoe.	Nursery Rhymes.	Heath.
5. Poems.	The star's fall; What the snowbirds said; The snow- bird's song; The first snow. The new moon; The drum.	Nature in Verse. Field's <i>Poems of Childhood</i> .	Flanagan.
6. Songs.	Twinkle, twinkle, little star; Tiny little flakes of snow; The snow clouds; January.	Songs in Season.	Silver-Burdett.
7. Picture study.	Madonna of the Chair.		

## FIRST YEAR—Sixth Month

1. Food used in the family. Sources and preparation.			
2. Nature stories.	The little brown seed; Pussy willow's hood.	Cat Tails.	Flanagan.
3. Stories for telling.	Prometheus. The great bear in the sky. Cinderella. Stories of the childhood of Lincoln, Washington and Long- fellow. Valentine stories.	Nature Myths, Cook. Judd. Classic Myths. Gathered from the best of their biog- raphies. Child's World, Poulsson.	Flanagan. Rand-McNally, Rand-McNally.
4. Mother Goose melodies.	Little Miss Muffet; Babes in the wood; When I was a bachelor. Adventureous buds; The crocus' soliloquy; The pussy willow. February.	Rhymes and Jingles. Nature in Verse.	Heath. Silver-Burdett.
5. Poems.	The flag.	Prose and Verse for Children. Gaynor.	Houghton.
6. Songs.	The drum; Hurrah for the flag. Baby Stuart; Feeding the birds.	Eleanor Smith (Song Book 1.). Perry Pictures.	Silver-Burdett. Silver-Burdett.
7. Picture study.			

## FIRST YEAR—Seventh Month

1. House cleaning. Plans for gardens of vegetables and flowers.			
2. Nature stories.	The towels party; The magnet's choice.	Cat Tails.	Flanagan.
3. Stories for telling.	The house that Jack built; The old woman and her pig; Jack and the bean stalk. Woden, the god of the northern sky; The legend of the north wind. The bag of winds; Echo, the air maiden.	Classic Myths. Foster and Cummings' <i>Asgard Stories</i> . Judd.	Rand-McNally, Silver-Burdett, Rand-McNally.
4. Mother Goose melodies.	There was a little girl; There was an old woman lived under a hill; Little Jack Horner; Curly Locks.	Nursery Rhymes.	Heath.
5. Poems.	The wind. How the wind blows; The tree—Björnson; A laughing chorus. How the little kite learned to fly. The duel.	Bevernson. Nature in Verse. Prose and Verse for Children. Field's <i>Poems of Childhood</i> .	Silver-Burdett. Houghton.
6. Songs.	March winds; My kite. The sap has begun to flow.	Educational Music Course for Elementary Grades. Eleanor Smith (II.).	Silver-Burdett.
7. Picture study.	Spring.	Corot.	

## FIRST YEAR—Eighth Month

SUBJECTS	SELECTIONS FOR STUDY	SOURCE OF MATERIAL	PUBLISHERS
1. The home garden. The return of the birds to the neighborhood.			
2. Nature stories.	Fish or frogs; Old Sol's rainbow; A living flow.	Cat Tails.	Flanagan.
3. Stories for telling.	Iris, the rainbow princess. Indian story of the robin. The legend of the anemone.	Classic Myths. Nature Myths. Classic Myths.	Rand-McNally. Flanagan. Rand-McNally.
4. Mother Goose melodies.	Old Mother Hubbard; Jack and Jill.	Nursery Rhymes.	Heath.
5. Poems.	The rain—Stevenson; April showers; Who likes the rain? The polliwog. The chicken's mistake. April fools. Hepatica.	Nature in Verse. Poems of Alice and Phoebe Cary. Nature in Verse. All the Year Round (I.).	Silver-Burdett. Houghton. Silver-Burdett. Ginn & Co.
6. Songs.	April, April, are you here? April. Rainbow fairies. Bubbles.	Songs in Season. Songs for Children. Child's Garden of Song. Child's Songbook.	Silver-Burdett. Silver-Burdett. Silver-Burdett. Silver-Burdett.
7. Picture study.	Feeding the bees.	Millet.	

## FIRST YEAR—Ninth Month

1. Making a calendar of May flowers. Excursions to garden and woods and fields to gather flowers.			
2. Nature stories.	The nest builders.	Fairy Stories and Fables.	American Book Co.
3. Stories for telling.	The three pigs; Puss in boots. Phaeton; Diana. The fast sowers. Legend of the dandelion.	Fairy Stories and Fables. Classic Myths. Andersen. Nature Myths.	Ginn & Co. Rand-McNally. Flanagan.
4. Mother Goose melodies.	A cat came fiddling out of a barn; Little robin redbreast sat upon a tree; I had a little pony, his name was Dapple Gray. Jack in the pulpit. Marjorie's almanac. Seven times one. The dandelion. The sugar plum tree.	Nursery Rhymes.	Heath.
5. Poems.	Jack in the pulpit. Marjorie's almanac. Seven times one. The dandelion. The sugar plum tree.	Whittier's Child Life. Nature in Verse. Jean Ingelow's Poems. Classic Stories. Poems of Childhood, Field.	Houghton. Silver-Burdett. McMurry.
6. Songs.	Dandelion fashions; America; Red, white and blue.	Eleanor Smith (II.).	Silver-Burdett.
7. Picture study.	The song of the lark.	Breton.	

## FIRST YEAR—Tenth Month

1. Talks about the birds and insects of June. The children can make many home observations and they enjoy reporting what they have seen.			
2. Nature story.	The story of the caterpillar and the study of cocoons.		
3. Stories for telling.	Story of the pea blossom; The town musicians. The origin of the woodpecker; How the robin got his red breast. Sing, sing, what shall I sing? As I was going to St. Ives; Mistress Mary, quite contrary. Seven times four. Little Nanette. Forget-me-not; Who was she? A fable.	Hans Andersen. Cook's Classic Myths. Nursery Rhymes. Jean Ingelow's Poems. Lucy Larcom's Poems. Nature in Verse. Nature in Verse.	Ginn & Co. Flanagan. Heath.
4. Mother Goose melodies.			
5. Poems.			
6. Songs.	Buzz, buzz, this is the song of the bee; A summer lullaby.	Eleanor Smith (I). Merrill.	Silver-Burdett. Silver-Burdett.
7. Picture study.	The melon eaters.		

## SECOND YEAR—First Month

The work of this year consists of the long poem of *Hiccupha*, history stories in the form of conversation lessons, fables, classic stories, short poems, and picture study. As in the first year this outline is based upon the Illinois course of study, which has been adopted by several states.

SUBJECTS	SELECTIONS FOR STUDY	SOURCE OF MATERIAL	PUBLISHERS
1. Hiawatha's childhood, Lines 64, chapter III, to end of chapter. Teacher tells the story, then reads from the poem. Children memorize and act out portions of the story, arranged in form of natural dialogue. Select such portions as children can read readily for their reading lesson. Make use of sand table, paper cutting and drawing.			
2. Stories, tell and play	The wolf and the seven kids. The happy family. The walnut-tree that wanted to bear tulips. Rheucus. Apprentice John. Pippa.	Language Reader II. (Baker & Carpenter). Andersen's Fairy Tales. Cat Tails. Lowell's Poems. The Child's World, Poulsson. Browning.	Macmillan. Flanagan. Parker's Classics. Flanagan. Merrill's Stories from the Masters.
3. Fables.	The last dream of an old oak. The dog and his image; The dog in the manger.	Andersen. Æsop's Fables.	Ginn & Co.
4. Conversation lessons.	The tree dwellers; Shelter, food; Animal enemies.	Dopp's Tree Dwellers.	Rand-McNally.
5. Poems.	A vagrant knight and lady. Little Boy Blue. My shadow. Two wise owls.	Tree Top and Meadow, McMurry. Eugene Field. Stevenson. Tree Top and Meadow. Zuber.	Pub. Sch. Pub. Co. Pub. Sch. Pub. Co.
6. Picture study.	Primary school in Brittany, or September.		

## SECOND YEAR—Second Month

SUBJECTS	SELECTIONS FOR STORY	SOURCE OF MATERIAL	PUBLISHERS
1. Hiawatha's friends. Conversations about these friends until the personality of each one stands out as real. Teacher read to the class. Read choice passages again and again. Children read, dramatize, memorize.			
2. Stories, tell and play.	King Midas. The fiddler and the oak. A fish and a butterfly. Aqua.	Language Reader II. Classic Myths. Child's Stories from the Masters. Wiggin's Story Hour.	Macmillan. Rand-McNally. Rand-McNally. Houghton.
3. Fables.	The wolf and the crane; The frog who wanted to be as large as an ox.	Æsop's Fables.	Ginn & Co.
4. Conversation lessons.	Tree dwellers; Story of the wild horse; The tree man's tools; Learning about fire.	Dopp's Tree Dwellers.	Rand-McNally.
5. Poems.	Autumn fire. A chestnut burr. Leaves and children. The wee fairy. Wyken, Blinken and Nod.	Tree Top and Meadow. Nature in Verse. Longfellow's Poems. Alice Cary's Poems. Eugene Field.	Pub. Sch. Pub. Co. Silver-Burdett. Houghton.
6. Picture study.	The return to the farm.	Troyon.	

## SECOND YEAR—Third Month

1. Hiawatha. Story of Mondamin, chapter V. Tell story and then read to class. Have children retell the story in parts.			
2. Stories.	Stories of Thanksgiving; The first Thanksgiving; A Boston Thanksgiving. Old time Thanksgiving.	Child's World, Poulson. St. Nicholas.	Flanagan.
3. Fables.	The lark and her young ones; The boy and the wolf.	Æsop's Fables.	Ginn & Co., also Parker's Classics.
4. Conversation lessons.	Tree dwellers. How the tree men made their first shelter; The first baskets. How they learned to cook their food; Their ornaments.	Tree Dwellers, Dopp.	Rand-McNally.
5. Poems.	Talking in their sleep; The fairies in winter; The night workmen. The pumpkins.	Tree Top and Meadow. Whittier's Poems.	Pub. Sch. Pub. Co.
6. Picture study.	Pilgrim exiles; The return of the Mayflower.	Boughton.	

## SECOND YEAR—Fourth Month

1. Hiawatha's sailing. Description of the canoe. Work out in painting, paper folding, etc.			
2. Stories.	The angel's promise; The manger; The mother of a king; The king's first journey; The boy in the temple; The story of the first Christmas. Christmas in other lands.	Stories from the Bible and from Hofer's Christ-Child Tales. Plan Book.	Flanagan.
3. Fables.	The lion and the mouse; The wind and the sun.	Æsop.	Parker's Classics.
4. Conversation lessons.	Cave men; The first cave home; The making of fire; Skin dressing and the making of clothes; Skin water-bags; Hunting the mammoth.	Tree Dwellers and Early Cave Men, Dopp.	Rand-McNally.
5. Poems.	While shepherds watched their flocks by night. Christmas carol. Christmas eve; Santa Claus' petition; Kris Kringie—Aldrich.	Deland. Longfellow's Poems. Tree Top and Meadow.	Pub. Sch. Pub. Co.
6. Picture study.	The arrival of the shepherds.	LeRolle.	

## SECOND YEAR—Fifth Month

1. Hiawatha's fishing. Describe the sturgeon. Tell story of the struggle, of the rescue.			
2. Stories.	The valiant blackbird (learn and play). The story of the New Year. The bird with arrow feathers. Parsifal. The milky way.	Language Reader II. Anderson's Fairy Tales. Classic Myths. Child's Stories from the Masters. Angard Stories, Foster and Cummings.	Macmillan. Parker's Classics. Rand-McNally. Rand-McNally. Silver-Burdett.
3. Fables.	The donkey and the salt; The fox and the stork.	Æsop.	Ginn & Co., also Parker's Classics.
4. Conversation lessons.	The eskimo; Descriptions of the northland and the northland people; The reindeer and his usefulness.	Eskimo Stories.	Rand-McNally.
5. Poems.	The ferns; The frost; Snowflakes. A New Year's greeting. Wintertime poems.	Tree Top and Meadow. Lowell's Poems. Riley's Rhymes of Childhood.	Pub. Sch. Pub. Co. Houghton.
6. Picture study.	The bells.	Blashfield.	

## SECOND YEAR—Sixth Month

SUBJECTS	SELECTIONS FOR STUDY	SOURCE OF MATERIAL	PUBLISHERS
1. Hiawatha's wooing, chapter X.			
2. Stories.	One eye, two eyes, three eyes. The giant with the belt of stars. Beasties. Stories of boyhood and youth of Washington, Lincoln, Franklin. Stories of St. Valentine; Stories of carrier pigeons.	Language Reader II. Classic Myths. Stories from the Masters. The "True Story" series by Brooks. Child's World. Æsop. Eskimo Stories.	Macmillan. Rand-McNally. Rand-McNally. Century Company. Planagan. Ginn & Co. Rand-McNally.
3. Fables.	The boy and the frogs.		
4. Conversation lessons.	The eskimo; His house, food, dress; Eskimo dogs and their use.		
5. Poems.	Mt. Vernon bells. The flag goes by. A Norse lullaby, Pitypat and Tippytoe. To mother's fairy. Lady Moon.	Plan Book. Tree Top and Meadow. Eugene Field. Cary's Poems. Tree Top and Meadow.	Planagan. Pub. Sch. Pub. Co. Houghton. Pub. Sch. Pub. Co.
6. Picture study.	A helping hand.	Emile Reneuf.	

## SECOND YEAR—Seventh Month

1. Hiawatha's wedding feast, chapter XI.			
2. Stories (learn and dramatize).	Why the sea is salt. Where frogs came from. The Angelus. Spring and her helpers; North wind at play. The four winds.	Language Reader II. Classic Myths. Stories from the Masters. Child's World. Andersen.	Macmillan. Rand-McNally. Rand-McNally. Planagan. Ginn & Co.
3. Fables.	The ant and grasshopper; The goose that laid the golden egg.	Æsop.	Ginn & Co.
4. Conversation lessons.	The eskimo; Hunting the seal and the bear; Life in the igloo; Children's games among the eskimos.	Eskimo Stories.	Rand-McNally.
5. Poems.	March. The wind. Waiting to grow; Windy night, Stevenson. March. Night wind, Stevenson.	Celia Thaxter's Poems. Frank Dempster Sherman. Tree Top and Meadow. Wordsworth. Child's Garden of Verse.	Pub. Sch. Pub. Co. Parker's Classics. Rand-McNally.
6. Picture study.	At the watering trough.	Bonveret.	

## SECOND YEAR—Eighth Month

1. Hiawatha's picture writing, chapter XIV.			
2. Stories.	The ugly duckling. Proserpine. Saul and David. Little Gustava. Old pipes and the dryads. The story of Easter.	Language Reader. Classic Myths. Old Stories of the East. Thaxter. Stockton's Fanciful Tales.	Macmillan. Rand-McNally. American Book Co. Parker's Classics.
3. Fables.	The quarrel; The wise goat.	Fairy Stories and Fables.	American Book Co.
4. Conversation lessons.	The cliff dwellers; Their homes, food, water, weaving, pottery, home customs, religious ceremonies.	Lotami.	Pub. Sch. Pub. Co.
5. Poem.	Crocus; Song of the lilacs; At Easter time; The secret; What robin told me; The throats.	Tree Top and Meadow.	Macmillan.
6. Picture study.	The willows.	Corot.	

## SECOND YEAR—Ninth Month

1. Hiawatha. Death of Kwasind, chapter XVIII.			
2. Stories.	Sif's golden hair. Why the narcissus grows by the water; Pegasus. May thirtieth.	Asgard Stories, Foster and Cummings. Classic Myths. Cot Tails.	Silver-Bordett. Rand-McNally. Planagan.
3. Fables.	The horse and the stag; The father and his sons.	Æsop.	Ginn & Co.
4. Conversation lessons.	Lake dwellers; Their home in the lake, clothing, implements, occupation.	Lake Dwellers.	Pub. Sch. Pub. Co.
5. Poems.	Robert of Lincoln. Little white lily; Frogs at school. The swing, Stevenson.	Bryant. Tree Top and Meadow. Child's Garden of Verse.	Parker's Classics. Pub. Sch. Pub. Co. Rand-McNally.
6. Picture study.	Dance of the nymphs.	Corot.	

## SECOND YEAR—Tenth Month

SUBJECTS	SELECTIONS FOR STUDY	SOURCE OF MATERIAL	PUBLISHERS
1. <b>Hiawatha.</b> The coming of the white man's foot, chapter XXI. The departure of Hiawatha, chapter XXII.			
2. <b>Stories.</b>	Hans and Gretel. Why the partridge stays near the ground; The myth of Orpheus. The fax flower. May blossom.	Language Reader II. Classic Myths. Andersen. Grimm.	Macmillan. Hend-McNally. Ginn & Co. American Book Co.
3. <b>Fables.</b>	Review of fables of the year.		
4. <b>Conversation lessons.</b>	American Indian; His home, food, shelter, occupations, customs, education.	American Indians, Starr.	Hesth.
5. <b>Poems.</b>	June. The swallow; Discontent; The quail's nest. Daffodils. At the court of Queen Flora. The emperor's bird's nest. The sandpiper. The aurora.	From Lowell's Vision of Sir Launfal Tree Top and Meadow. Wordsworth. Nature in Verse. Longfellow's Poems. Celia Thaxter's Poems. Guido Reni.	Parker's Classics. Silver-Burdett.
6. <b>Picture study.</b>			

**Picture Study.** A picture study has been suggested for each month of the elementary course, but many teachers are themselves untrained in the study of pictures and need help. Books that will help in the study of pictures: *Masters in Art* (series of monographs), Bates and Guild Co., Boston. *Picture study in elementary schools*, Macmillan. *Story of art and artists*, Macmillan. *Studies of master artists*, Houghton-Mifflin. *Perry Picture Company and Brown Picture Company* sell both penny and five-cent pictures which are very good for class study. Get large and fine engravings whenever possible.

### LEARNING TO READ—READING TO LEARN.

—The mechanics of reading are so difficult that during the first and second years the energy of the reading lesson must be directed chiefly toward learning to read. This does not mean that the first reading lessons have no thought content, but this content comes at first chiefly through the suggestion of the teacher. But this is all to be changed. By the time the child has reached the third or certainly the fourth year in school the mechanics of reading should have been pretty thoroughly mastered. He reads independently now to get the thought for himself. If books have been presented to him in the right way the printed page becomes an open door by which he enters a storyland. He enters because he loves it and reading is no longer a compulsion.

Two motives are strong enough to make any intelligent child a good reader—to read to himself because he wants to know, and to read aloud to others because he wants to make them understand the thing that is so well worth knowing. This involves two things—well selected reading and companionship, some one at hand, mother or father or teacher or class, to whom there is some joy in telling the story gathered from the printed page. It is not necessary to describe the method of such a lesson or the spirit of such a teacher.

**Drill in Phonics.**—As children are to be made self-helpful they must be taught the method of attacking new words in their daily reading. Phonics drill should be given daily in all the lower grades.

At first train the ear and vocal organs to recognize and imitate sounds. Clear, distinct oral expression should be secured before any attempt is made to teach the written form. Not a few of the difficulties met by the child in mastering the mechanics of reading would be removed if his ear were trained to hear the correct sound. Very careful attention should be given to each child's ability to speak distinctly. If defects of hearing or speech are detected they should be attended to at once, for often such defects may be corrected in the young child.

After a little oral drill in clear and correct enunciation, written representations of sounds may be given, beginning with con-

sonants and long and short vowels. New words which occur in the reading lesson should be broken up in the oral spelling lesson into syllables and spelled by sound or the sound of the vowel in the accented syllable should be given. As early as the second school year children should be able to pronounce with a fair degree of confidence almost any word that occurs in their reading lesson if they have been given the help of the accent and a few diacritical marks.

Exercises like the following may be multiplied for phonic drill: Review the consonant sounds in words with long or short vowels, and without using marks except over the first word of the groups. Place the phonogram at on the board. Let the pupils build the group of words *fat, bat, cat, hat, mat, rat, sat*. Beginning with *ate* they will construct the group—*ate, fate, gate, slate, plate, date*. In like manner use *an* and *one, ad* and *ade, ap* and *ape, ag* and *age, am* and *ame, ack, ake* and *ace, ang* and *ange, and, ank, act, amp, ash*. Notice the effect of final *e* on the sound of *c* and *g*, and also on the sound of the preceding vowel.

Then take the phonograms containing short or long *e, i, o, u, y*, and make families of words as above. Give exercises in the same way with initial and terminal consonants: *sh, ch, wh—she, shall, shell; cash, hash, lash; chin, chip, chick, chick; much, such, touch; which, when, while, white*.

Drill on final phonograms in words of more than one syllable: *ing—coming, having, making, taking, living; er—hunter, mother, shiver, farmer; en—seven, garden, chicken, broken, woven; ed—safest, surest, sweetest, dearest, kindest, honest; ed—lived, asked, raised, looked, wished, called, learned; er—waves, makes, takes, moves, loves, comes; or—sailor, honor, favor, savor; ed—hatched, bonnet, jacket; y—pithy, duty, stormy; ny—sunny, funny, bunny; ly—slowly, truly, lovely; ty—kitty, empty, plenty*.

In this way take other combinations and give frequent and thorough drills until the child can immediately produce the vocal sound from the written symbol. It is not sufficient to think that a sound once learned has been acquired. It must become a habit to speak with distinct utter-

ance. Use phonics not only as a key to new words, but as an exercise in articulation. Divide words into syllables. Give drills on the small words that are frequently slurred over, *as to, was, of, for, from, get, just, can*. Attention should be given to voice and expression, such as characteristic good conversation.

Such systematic drill in phonics should succeed for the child the correction of bad habits of speech, such as nasal tones, drawing, dropping final sounds, mumbling, talking without movement of lips and jaw, and every kind of indistinct utterance, and in addition should give him power to read the printed page for himself.

**Story-Telling as a Language Exercise.**—Children delight in hearing good stories and in telling them again and again. The old, old story is the favorite. With the telling of the story there is often free dramatic action which may be developed into a fine method of interpretation. The story-teller gains power and freedom in the use of language. He enriches his vocabulary by unconsciously using the words of others; he enriches his life by entering into the lives of others and understanding the essential relation between motive and conduct.

The story may be made the basis of all kinds of language exercise. As in the first and second grades what the child reads becomes the center of the school program, so in the third grade language expression becomes the leading thought.

As *Hiawatha* has proved a very attractive story center for the second grade, so *Robinson Crusoe* has been found to furnish an excellent center for history, geography, and language in the third-year course. From the fourth grade, on through the grammar course, history and geography form two important and interrelated centers of interest and study around which crowd many human interests and from which any amount of language teaching may be derived.

**Written Work** should follow as a natural sequence the oral lesson. Artificial writing is poor writing. The child talks because he wishes to talk and he talks well. In the same way he should write because he has something to write about. The technique of the art of good writing is laid down in a succession of well-organ-

ized lessons in our language books, but the practice of this art belongs to every lesson in the school and to the habit of every day. The study of grammar in the upper grades is important only as it becomes an intelligent means to the one great end, power and fluency in the use of the mother tongue.

**Reading to Children.**—It has been often repeated that the teacher must know literature and must read often to her class and that above all she should be a good reader as well as a good story-teller. Parents and teachers, all who mingle with little children, should know and love the books and poems that the children love. Let the teacher practice on a few of the best poems and read them to her class with responsive appreciation in her voice and she will never again be afraid that she cannot learn to read or that she cannot hold the interest of her class. A few beautiful poems are suggested here as suitable selections. Let each teacher add to these others of her own choosing. Select a few poems that appeal most strongly and then read those again and again until the words seem to be their very own. Let the teacher do this and she will in time find herself classed among the very few who are worthy to be called good readers.

#### Poems to Read to the Children

Rock-a-bye, thy cradle is green. . . . .Nursery rhymes.  
The world is so full of a number of things. . . . .Stevenson.  
What does little birdie say. . . . .Tennyson.  
Twinkle, twinkle, little star. . . . .Jane Taylor.  
Angels at the foot. (Watching Angela). . . . .Christina Rossetti.  
The lullaby. . . . .Joseph Gilbert Holman.  
Jam and jelly and bread are the best of food for a child. . . . .Edward Lear.  
The quangle-wangle's nest. . . . .Nonsense Book.

#### Poems that Children Love and Books that Help in Story-Telling

And I must follow, would I find  
The inward riches to all this wealth of life.

Ingen. . . . .One thousand poems for children. . . . .Jacob Co., Geo. W.  
Hazard. . . . .Three years with the poets. . . . .Houghton.  
Ward. . . . .Poems every child should know. . . . .Doubleday.  
Smith, Eleanor. . . . .Song books I and II. . . . .Milton Bradley.  
Matthew. . . . .Poems of American patriotism. . . . .Maynard-Merrill.  
Barrie. . . . .Famous poems explained. . . . .Hinds, Noble & Elledge.  
Lear. . . . .Nonsense rhymes. . . . .Little.  
Palgrave. . . . .Child's treasury of English song. . . . .Macmillan.  
Bryant. . . . .How to tell stories to children. . . . .Houghton.  
Houghton. . . . .Stories to tell to children. . . . .Houghton.  
Harrison. . . . .Telling Bible stories to children. . . . .Houghton.  
Frye. . . . .In story land. . . . .Central Pub. Co.  
Wiles. . . . .Two children of the foothills. . . . .Sigman Pub. Co.  
Wiggin and Smith. . . . .The place of the story in early education. . . . .Ginn.  
Wiggin and Smith. . . . .The story. . . . .Houghton.  
Baldwin. . . . .The story. . . . .Houghton.  
Burd. . . . .Fifty famous stories retold. . . . .Am. Book Co.  
Burd. . . . .Prose every child should know. . . . .Doubleday.  
Mable. . . . .Myths every child should know. . . . .Doubleday.  
Foster and Cummings. . . . .Legend stories. . . . .Silver-Burdett.  
Baldwin. . . . .Old stories from the East. (Bible stories). . . . .American Book Co.  
Richards. . . . .Five minute stories. . . . .Little.  
Richards. . . . .Golden windows. . . . .Little.  
Foulson. . . . .Through the farmyard gate. . . . .Lothrop.  
Foulson. . . . .In the child's world. . . . .Bradley.  
Seadler. . . . .The children's book. . . . .Houghton.  
Harrison. . . . .Uncle Remus. His songs and sayings. . . . .Appleton.  
Frye. . . . .Wonder story. . . . .Harper.  
Fairly tales from Andersen and selected tales from Grimm belong to every child. For other books of poems and stories see lists of books for children's library. Some books have been given in both equal to the teacher and to the child.

**LANGUAGE AND LITERATURE.**—Under teaching the child how to read, a detailed outline of suitable material arranged for first and second year language has been given, but the question may still be asked by the mother or the teacher how to instruct the little ones who are beginning to read. What is the method

To-whit to-whit to-wheel Who goes to the bird's nest. . . . .J. M. Child.  
To-whit to-whit to-wheel Who goes to the bird's nest. . . . .C. G. Rossetti.  
Great, wide, beautiful, wonderful world. . . . .W. B. Randa.  
Many, many, many, a minute! . . . .Christina Rossetti.  
What does the bee do? . . . .Christina Rossetti.  
Baby wants a lullaby. (Innocent's lullaby). . . . .William Brightly Randa.  
This is the way the ladies ride (The nursery song). . . . .William Canton.  
Baby bye, here's a fly, let us catch him, you and I. . . . .Joseph Gilbert Holman.  
Over hill, over dale. (Midsummer Night's Dream). . . . .William Shakespeare.  
O Lady Moon. . . . .Christina Rossetti.  
While shepherds watch their flocks by night. . . . .Found in Golden Numbers.  
Dark brown is the river. (Where do the boats). . . . .Robert Louis Stevenson.  
When the elf king went to battle. (The Magic Casket). . . . .R. C. Lehman, Alfred Noyes.  
As soon as the fire burns red and the stars sleep (The Fire-fairy Palace). . . . .Josephine Dodge Daakam.  
There is ever a song somewhere, my dear. . . . .James Whitcomb Riley.  
The wind-broom sweeps so wondrous clean. (The Wind-Broom). . . . .Richard Burton.  
As I walked over the hills one day. . . . .A. Nursery Song, Fire-fairy Palace.  
There's a merry brown thrush. . . . .Mrs. Carter.  
Now the day is over. (Child's evening hymn). . . . .Sabine Baring-Gould.  
Both at home and in school read reread. *Bed in Summer Time, I Saw You Toss the Kites on High, A Child Should Always Say What's True, How Do You Like to Go in a Swing!* Rossetti's *Who Has Seen the Wind? O Lady Moon, What Does the Bee Do?* Field and Riley and Cary and Others: *Waiting to Grow, Plump*

*Little Baby Clouds, Sleep, Baby, Sleep, Rockabye Lady.* Jingles from the Jingle book and over and over read the rhymes of Mother Goose. Sometimes read selected psalms. Read with reverence and exaltation until the children, too, catch the uplift of the words. "When I look up unto the hills, behold Thou art here?" "The heavens declare the Glory of God, and the firmament sheweth His handiwork."

#### Suggested Material for Help of Teachers.

—The teacher of language and literature must know literature at its best. She must appreciate the double aim of language teaching—facility in the correct use of language and appreciation of good literature. For herself she needs the stimulation of the best that has been written and for her class she needs to know the literature for her grade. This is especially true for the teacher of the little ones. She must know the literature that children love, their poems and their stories, and she must practice well the art of story-telling.

The book-loving teacher will have a book-loving school. To lead children to the proper use of books the teacher must know children's books and enjoy using them.

An occasional period set aside during the week for the purpose of talking over with the children the books they have read will be found valuable. Every schoolroom should contain a library selected for the use of every child in every grade. Nowhere is the privilege of individual selection more valuable than in the choice of books. When "learning to read" has given place to "reading to learn" and "reading to enjoy" then the drudgery of learning has been overcome.

#### For Children at Home and the First Two Years in School

Jewett. . . . .The three baby bears. . . . .Dutton.  
Burgers. . . . .Baby days. (Songs and pictures). . . . .Stokes & Co.  
Burgers. . . . .More gooses and how not to be them. . . . .Stokes & Co.  
Greensward. . . . .Under the windward. . . . .Warne.  
Potter. . . . .The tale of Mrs. Jeremy Fisk. . . . .Warne.  
Ginn. . . . .Fairytale, ed. by Mrs. Fisk. . . . .Ginn.  
Adelberg. . . . .Clean Peter and the children of Grubby. . . . .Longmans.  
Lear. . . . .Nonsense rhymes. . . . .Little.  
Flanagan. . . . .Child stories and rhymes. . . . .Flanagan & Co.  
Mother Goose, or the old nursery rhymes. . . . .Warne.  
Ginn. . . . .Mother Goose melodies, or songs for the nursery. . . . .Houghton.  
Æsop. . . . .Child's version of Æsop's Fables; ed. by Sienkiewicz. . . . .Ginn.  
Andersen. . . . .Fairytale; selected and edited by Ursula. . . . .Maynard.  
Brooks. . . . .Stories of red children. . . . .Ed. Pub. Co.  
Bennet. . . . .Little Indian book. Little brothers of the West. . . . .Stokes.  
Turpin. . . . .Child's book of poetry. . . . .Clasman.  
Hollbrook. . . . .Hilawatha primer. . . . .Houghton.  
Alexander Blake. . . . .Graded poetry. Separate volumes for each grade. . . . .Merrill.  
Andrews. . . . .Seven little sisters. Each and all. . . . .Ginn.  
Brown. . . . .Stories of woods and fields. . . . .Globe.  
Burd. . . . .Little Boy Blue and his friends. . . . .Little.  
Long. . . . .Nursery rhyme book. . . . .Warne.  
Richards. . . . .Five minute stories. . . . .Estes.  
Foulson. . . . .Child stories and rhymes. . . . .Lothrop.  
Graver. . . . .Sachetonee tales. Overall boys. . . . .Rand McNally.  
Picture books by Nelson, Warne, Turk, Dutton, bring a wealth of joy into the nursery.  
Story of the three little pigs. . . . .Warne.  
Story of the three bears. . . . .Warne.  
All sorts of animals. . . . .Nelson.  
Animals and their young. (Natural history series). . . . .Turk.  
Cinderella and Red Riding Hood. . . . .Dutton.  
Cock and Hen. (Cock and Hen farm series). . . . .Turk.  
Our dogs. (Picture land series). . . . .Turk.  
All about wild animals. . . . .Turk.  
Johnny Crow's garden. . . . .Warne.

or what are the steps in the process? Very little is heard nowadays about word method, sentence method or phonic method as separate methods in themselves. The best teaching chooses from all methods. **How the Several Methods May Be United in the First Reading Lessons:** 1. Words as wholes. (a) Use of objects repre-

senting the word; (b) spoken word used in connection with the object; (c) the word as form, either script or printed form—the object, the idea, the vocal symbol, the written symbol, all in combination.

2. Words in combination. (a) Groups of words or words grouped in phrases; (b)

words arranged in sentences, grouped in paragraphs or as story wholes.

3. Analysis of words. (a) Words broken up into sounds—phonics; (b) words broken up into separate forms—letters.

### The Eclectic Method as It Has Been Outlined for a Training School—

1. Conversational work whereby teacher gains knowledge of child's interests, intelligence, maturity, habits, home training, environment, and use of English. Here objects are often introduced.

2. (a) Blackboard work. Action sentences largely such in form and in content as have been used by child in conversational work. (Thought and sentence method.) (b) Discovery of parts of sentence words. (Word method introduced.) (c) Discovery of parts of words, letters, names and sounds of letters. (Phonic method.)

The test of good teaching is the drill that follows the development lesson. After the child has learned the nature of word symbols and has acquired a small reading vocabulary the importance of such drill exercises must be emphasized.

### Analysis of a general plan for reading drill—

1. Preparation through word mastery.

2. Results to be obtained. (a) Recognition of words at sight, (b) correct and easy enunciation, (c) mastery of sound and form elements, (d) knowledge of their meaning.

3. Methods by which this word mastery is acquired. (a) Writing new words, (b) reading new words, (c) spelling by sound and by letter, (d) meaning of new words, (e) use in original sentences. Briefly summarized, the reading drill should fix vocabulary and form word images.

4. Reading the new lesson. The test of good preparation is the grasp of thought and feeling as expressed through good vocal expression. The three arts of education—seeing, reading, thinking—should be combined in every reading lesson.

From the beginning give the child in his lesson something worth thinking about and from the first give him an interested audience—a teacher and a class who care for what he reads and will listen with interest. This will lead the child in his reading to form the habit of complete thought and complete expression as found not only in the single sentence but in the entire selection. Then what he reads will seem to him worth while and he will learn to love the printed page. As has been fully said, he will enter the path "which our forefathers blazed through the wilderness and make of it a highway down which he may ride a king in his power to use the English language."

### Things to Be Remembered in Teaching Reading.—1. Teach only such words as are needed for use.

2. Keep a complete list of all words taught. 3. Keep a separate list of all words found difficult. Review and review until mastered.

4. Call for silent reading. Have child tell you what he has read.

5. Call for silent reading of dramatic passage. Have child act out what he has read.

6. Again call for silent reading, this time a longer passage. Have child tell in his own words what he has read.

7. From the very first sentences require natural tones. This can easily be done by simple, natural questioning.

8. Do not let any member of the class interrupt one who is reading aloud. There should be confidence, not confusion, when one is reading.

9. A few minutes of rapid drill in cor-

rection of errors common to the class is a good preliminary exercise. The teacher should correct, but not nag. Remember that drill exercises should be short.

10. Encourage every child to do his best and when he has done his best receive it in a pleasant, gracious manner. Children are sensitive to the atmosphere of approval. Encourage, suggest, do not repress.

11. Young children cannot study undirected. Work of a definite, concrete kind should be assigned to them. Through occupation they learn concentration.

12. Make the sentence or the thought a unit. If skillful questioning lead the child to the thought he is to give you from the reading, as, What did the dog do? Why did he like the boy? Such indirect help is the best way of suggesting right expression.

13. Short daily exercises of a rapid, decided, vigorous character should be given to train the class to quick recognition of words and sentences. It is a great gain in education to make a person quick and resourceful.

### Suggestions and Devices for the Inexperienced Teacher.—

The experienced teacher has long ago invented many of her own devices, has outgrown them and invented others. There are no fixed methods of teaching. It is a continual round of interesting change, the more interesting to the original mind which is always inventing something new. It must be remembered, however, that novelty is not the aim, but growth. The growing teacher welcomes that which adds new interest or in any way yields better results.

1. The first language lesson must begin with oral exercise—something interesting to talk about.

2. The point of thought is the sentence. The child gives his thought, and the teacher writes it on the board, underlining the important word. It may be the child tells what he picked up from the table, as, "I have a book." Other children tell theirs, as, "I have a ball." "I have a box." Each child finds his own story and his own particular word. This game of hide and seek gives rest and holds attention. It may be worked out in many ways.

3. Write the children's names. Let each child find the name of some other child or the age of some other child or the brother of some other child. Such exercises can be multiplied. The teacher makes her crayon talk, and the children talk to her. Write a nonsense rhyme upon the board. Read it to the class. Read again, pointing slowly to each word. Let children point to principal words.

B was a bat who slept all day,

Brown little bat!

Some teachers have enriched the child's fancy by adapting Lear's *Nonsense Rhymes* to the teaching of the alphabet.

C was a cat, crafty old cat.

D was a duck, dear little duck.

The pictures and the words make good seat exercises for copying.

4. Find and pronounce all words on the board containing a given letter, as c, f, c, etc.

5. Arrange the words of a paragraph in alphabetical order.

6. Write on the blackboard or on paper all the words of the reading lesson beginning with a certain letter. Instead of writing on the board the material in the word boxes may be used.

7. Words written upon the board promiscuously, so far as the initial letter is concerned, are to be grouped alphabetically in columns, each group with the initial

letter at its head. Many forms of dictionary work may be given. Children must learn the alphabet, but there are better methods than the old mechanical method of the a, b, c's.

8. Build or write in columns all the words containing a given vowel sound.

9. Write in columns all words containing a given phonogram.

10. Words of the lesson are written on the board. Words are erased one by one and the child tells which word was erased.

11. Arrange words in duplicate columns except that the order of words is changed. Give to one of the class a pointer, and have him point to a word pronounced by the teacher. The game consists in seeing which child points first.

12. A child finds and pronounces all the words with a given ending or a given beginning. Valuable for prefixes and suffixes.

13. The teacher points to a word, the child reads and gives a sentence containing that word.

14. The singular form of nouns whose plurals are formed by adding s may be written upon the board. Let the children build the plural form by adding s.

15. Draw a doll house. Let children tell what furniture they want to put into it. Write these words in a column. Let children furnish by pointing to word and then to the place in the house where the furniture should be. Make, mark, or write word in the house. Picture of a ball game might be done in the same way.

16. Have pupils look through a paragraph and tell what has been read.

17. Have pupils look through a sentence or paragraph and act out the meaning.

18. Have pupils read a paragraph silently and illustrate the meaning by drawings or a series of drawings.

19. Give dialogue exercises frequently where one child replies to another. Encourage dramatic expression in voice and body.

20. The teacher should often read to the class and with the class. Exact imitation is not wanted but through suggestion and the glow of her spirit the teacher may awaken her class to the love of interpretative reading.

### Three Essentials in the Teaching of English.—

1. Fixing the word in the child's vocabulary. 2. Fixing the word symbol through the activity of the eye and ear and hand. 3. Centering attention upon thought, rather than mere symbol getting, that in the end the child may gain mastery of thought and speech.

### Suggestions for Seat Work Related to Primary Readings.—

1. Seat work should be related to the lesson. The aim in all exercises should be to train the child to look for something in the lesson and expect to find it. It is the active mind, the attentive mind, that can be educated.

2. Provide worn-out books, magazines, advertisements, etc. which can be cut up. Provide blank books, one for each child. Print the letters of the alphabet on the board. Let the children find them, cut them out, and paste them neatly in order, a at top of page 1, b at top of page 2, etc., to z.

3. New words occurring in the reading lesson may be printed or written on the board; children may find these words cut them out, and paste them on the proper page. This will give each child the printed vocabulary of his grade. When they can read words children may make dictionaries or word books by writing the words instead of cutting and pasting.

4. Put several alphabets in the same

canal boat. 4. The lock; its walls and gates. 5. Paving the lock.

Excursions may be made to a dairy, a creamery, or a grain field, a harvest field, a flour mill, a bakery, a stream of water, to lake or ocean if near at hand, to a vineyard or orchard, a brick or a tile manufactory, a lumber yard, a place of house building. It is not necessary to make many excursions, but a few well selected typical ones, and care must be taken that time and attention of the class be well economized both in the excursion and in the recitation.

**School Excursions in Europe.**—In Germany, France, Holland and other countries of Europe school excursions for the primary purpose of the studying of geography and history are organized on an extensive scale. Nearby excursions are planned for the little ones and long journeys to distant places for the older classes. Very careful preparations are made so that the child shall have both physical and intellectual benefit. Sometimes several vacation weeks are planned out in this way, the aim of which is primarily education and not vacation sports as would be the case probably in America.

**The Use of the Text-Book.**—The right use of the text-book when first put into the hands of the child is so important that the New York state syllabus gives this advice to the teacher: "The elementary text-book in geography is usually the first book placed in the hands of the children which they are expected to study for the purpose of obtaining information, and for that reason it is extremely important that its use should be carefully taught. This is best done by discussing each day in class the lesson for the next day, and at the close of the oral work assigning the same lesson for study. Later the children should be called upon to recite upon the text. After a little it will be sufficient to point out during the assignment of the lesson the items of greatest importance, adding thereto 'search questions' the answers to which may be found in the text." It may be added that to teach a child how to study is as important as what to study. There is a deplorable lack of this knowledge even among the men and women in our universities.

By the aid of the text-book and the globe the class should first become acquainted with the relation of the great land masses and the ocean. They should also be given a larger view of the earth as a great ball in space "whose surface is varied by continents and oceans and upon which the sun and moon shine from a distance."

**Pictures and Illustrations.**—Pictures and illustrative material should in every grade be freely used. Illustrations cut from magazines and other sources should be selected and preserved under suitable covers. The children, if encouraged to do so, will bring from their homes a vast amount of material that will illustrate the subject and make it interesting. The children of the fourth grade in their large general view of other countries may begin books of illustration which will become to them a delight.

Stories form the best illustrations, stories about other people and where they live and how they live. In every grade geography correlates closely with the other work of the grade.

The study of industries furnishes an abundance of material for the best sort of modern arithmetic, and the stories of in-

dustry, people and products, when retold by the children, furnish excellent drill in the use of correct English.

**Map Making and Map Study.**—As the class advances more times should be given to map study and to the studies of the globe. The map is the written language of space relation. Every bit of our geography work is done with reference to location, and the map. It is well to understand the making and reading of the map, and the use of the scale. Make a plan of the school-room, taking measurements with the foot rule or yard stick, drawing the plan to scale, using a half inch or quarter inch to the foot. Enter the desk, stove, etc. Next make a map of the school yard, using a measuring tape or a ten-foot pole and practicing the measurement of such distances by "stepping" or "pacing" it off. Plot a before, using a smaller and appropriate scale. Enter the schoolhouse, out-buildings, roadway, trees and other prominent objects. It will be an easy step to the idea of charting a larger area, like the farm; then the teacher in a single lesson or so, may draw a map of the township, with the schoolhouses located in it, with other prominent features; then the county map, with the township conspicuous in it; then the state, with the county made prominent; the United States, with the state under observation, and North America, with the United States for observation.

As the child advances in the study of maps they should be made so full of meaning to him that he will take delight in learning from a new map as much as is possible before turning to the text. Throughout the grades considerable use should be made of large wall maps and relief maps as well as of the globe.

The following suggestions for the upper grades follow the course of study marked out in the Illinois syllabus. The work of the first grade should be first general—the making and reading of a map, and an acquaintance with the globe; then a trip around the earth in a study of the continents, with interest centered in the people and their industries. The second half of the year may be devoted to a study of the home county and state, and the physiographic regions of America (United States).

The work will be done according to a topical outline, which will fix the order of study and recitation. This outline may be placed on the board and left a few days until it is memorized by the class. With the outline any text may be used or several different ones may be in the hands of the pupils at the same time. Then, too, the whole library, and all the outside reading of pupils and teacher may be brought to bear upon the recitation. With the use of this outline should go a considerable drill upon a few place names, say about twenty-five, fixing them firmly in mind by map drill. The pronouncing vocabulary in the text-book should be in constant use.

Continuous map work should be done on maps supplied to the pupils, or on tracings they may make. A regular series of maps may be made for each continent, the pupil showing by tinting with colored pencils the great forests, grassy plains, deserts, races of men, areas of production of the leading commodities, trade routes, largest cities. These maps, finished neatly from day to day and approved by the teacher, will accumulate into a little volume as the pupil's own work.

**Geography in the Upper Grades.**—Above the fifth grade the point of view and emphasis change to another phase of

geography. In the previous grades the work was largely observational and descriptive in character, because the observational and imaginative activity of a child were then dominant. The pupils have been growing older, other mental activities have been coming forward which make it not only possible but necessary that the rational side of the subject shall be introduced more and more as the work progresses. By rational geography is meant the study of the subject matter from the point of view of cause and effect. In the study of the Sahara desert, for example, the arid conditions should not only be described, but they should be traced backward to their causes and forward to their effects on the life, habits, dress, and occupations of the people. The culminating interest in geography centers in the life of man, his occupations, his commerce and manner of living. Almost any one of these topics, if traced backward to its causes and determining conditions, soon ends in certain conditions of his physical environment. It is necessary to understand the physical environment of that life. The attention given to this side of geography in the previous grades has been more to the securing of good, clear mental pictures of physical features and the acquisition of facts than to the explanation of those features and facts. In this second study of physical environment, emphasize the processes concerned and the forces at work introducing that environment.

**Geography and History.**—Passing from the physical to the human side of geography we find how intimate are its relationships with history. Quoting from Dr. McMurry, "An examination of our whole course of study in geography will show that the historical considerations have largely shaped it, first America fully treated, then the movement toward Europe with an elaborate study of its large topics, and later the journey outward from Europe to the rest of the world."

**Type Lessons.**—The following type lessons are taken from McMurry's *Special Methods in Geography*. They illustrate the intimate relationship that exists between the study of geography and the literature of travel and biography and history, and how the study of geography can be enriched by well selected reading:

"A trip around the world on the parallel of the home. This forms an interesting base-line, on each side of which cities and countries can be ranged and a helpful comparison of diverse countries be made."

"A trip around the world on a meridian. This brings out all the contrasts of climate, the similarity of northern and southern hemispheres and the differences."

"Steamboat voyage around the world. This is means of discovering the position of different continents and oceans and some of the peculiar things of ocean navigation. These three excursions may serve to give the children a more definite idea of the geography of the world-whole. Pictures should be freely used as well as supplementary reading from books of travel."

**Geography Topics Parallel With American History Lessons.**—Journey across the Rocky Mountains. (Stories of Fremont and Lewis and Clark.) The Canyon of the Colorado River. (Story of Major Powell.) The Plateau of Colorado. The land of Mexico. (Story of Cortes.) Florida and the southern states. (De Soto and La Salle.) The trade route to India.

(Columbus and Da Gama.) The map of the world in Columbus' day. The equatorial current, trade winds, and Gulf stream. (Voyages of early navigators.)

"Champlain's voyages and explorations with a careful survey of the geography of

the whole, the St. Lawrence, Nova Scotia, Lake Champlain, the Ottawa river, the homes of the Iroquois and Hurons, the Atlantic Ocean and France."

"Hudson's voyages and explorations, the Pilgrims and the voyage across the Atlantic, Captain John Smith and his

exploring trips, Boone and the passes of the Alleghenies, Raleigh's expeditions, Washington's early life.

Map and blackboard sketches should be freely used. Pictures and sand maps, and all the means of concrete illustration needed to insure clear and correct notions.

#### BOOKS FOR THE STUDY OF GEOGRAPHY ARRANGED BY GRADES

**Reference Books for Teachers, Third Grade.**—Long, *Home Geography*, very elementary (American Book Co.); Tarr and McMurtry, *Home Geography*, first edition, for grades three and four (Macmillan); McMurtry, *Lessons in Home Geography*, illustrated lessons and exercises fully described (Macmillan).

**Books for the Children's Shelf, Third Grade.**—

*Doese, the Indian Boy*, Snedden (Hought.).  
*Our Own Country*, Dutton (Silver).  
*Seven Little Sisters: Each and All* (Ginn & Co.).  
*Around the World*, first book, Carroll (Silver).  
*Geographical Nature Studies*, Payne (American Book Co.).  
*The Snow Baby; Snow Land Folk*, Ferry (Stokes).  
*Big People and Little People of Other Lands*, Shaw (American Book Co.).  
*Children of the Palm Land*, Allen (Educational Publishing Co.).

**References for Teachers, Fourth Grade.**—McMurtry, *Special Methods in Geography* (Macmillan); McMurtry, *Topic-Lessons in Geography* (Macmillan); Trotter, *Lessons in the New Geography* (Harpers); Frye, *Brooks and Broad Basins* (Ginn); McCormick, *Suggestions on Teaching Geography* (Public School Publishing Co.); King, *Methods and Aids in Geography* (Lothrop).

**Books for the Children's Shelf, Fourth Grade.**—Tarr and McMurtry, *Around the World*, second book, Carroll (Silver).  
*The Stories of My Four Friends*, Andrews (Ginn & Co.).  
*Lozaria, the Little Lake Dweller*, Ward and Edson (Appleton).  
*Hans Brinker: Life in Holland*, Dodge (Scribner).  
*Heidi, Story of a Little Girl's Life in Switzerland*, Spitt (Ginn).  
*East, the Great Boy; Boy's Life in Switzerland*, Spitt (Ginn).  
*Four American Explorers*, Kingsley (American Book Co.).  
*Great Navigators*, Verne (Scribner).

**Explorers of the Nineteenth Century**, Verne (Scribner).  
*Wandering Heroes*, Abraham, Isaac, Joseph, Price (Silver).  
*Little Cousins Series*, several volumes, Wade (Page).  
*Family Plays*, several volumes, Gale (Lothrop).  
*The World and Its People*, three volumes, Dutton (Silver).  
*Story of Little Joe, the Dutch Boy*, Konrad, the Swiss Boy; *Mitsun, the Japanese Boy*, Campbell (Educational Publishing Co.).  
*Ten Boys on the Road From Long Ago to Now*, Andrews (Ginn).  
*Indians and Pioneers*, Hazard and Dutton (Silver).

**Reference Books for Teachers, Fifth Grade.**—Tarr and McMurtry, *North America*, second book (Macmillan); Redway, *The New Basis of Geography* (Macmillan); McMurtry, *Topic-Studies of North America*, part I. (Macmillan); Macmillan, *Lakes of North America* (Gleil & Thiner); *Nature and Man in America* (Scribner); Patton, *Natural Resources of the United States*, Science Primer series (American Book Co.).

**Books for the Children's Shelf, Fifth Grade.**—*Geographical Readers*, separate books for each country, Carpenter (American Book Co.).

*Pictorial Geography Readers*, six volumes, King (Lothrop). Each grade should be supplied with good wall maps and a globe, on geography; also separate state geographies.

*Stories from Little Storyland*, Livingston, Marden (American Book Co.).  
*Around the World*, third book, Carroll (Silver).  
*Little Journey Series*—Switzerland, France, Holland, Italy, Germany, Australia, Japan, China, South Africa, MacQuinn (Pittenger).  
*Around the World in the Sleep Train; Far West and Far East*, Sloum (Scribner).  
*Pioneer History Stories; Pioneers of the Mississippi Valley*, McMurtry (Macmillan).  
*Pioneers on Land and Sea; Pioneers of the Rocky Mountains and the West*, three volumes (Macmillan).  
*Heroes of the Middle West; The Story of Tully*, two volumes, Catherwood (Ginn).  
*The Boy Traveler; Travels in Many Lands*, given in several volumes, Knox (Harpers).

**NATURE STUDY.**—Pestalozzi said that the child's first tutor is nature, and her tuition begins from the moment that the child's senses are opened to the wonders of the surrounding world. Since his time nature study has been defined as "learning those things in nature that are best worth knowing to the end of doing those things which make life most worth living." Its aim is a happy, helpful adjustment. It is to set the child in the midst of nature as a companion worker.

**The School Garden.**—"To this end," happy, helpful adjustment, "the school garden has proved most practical." Froebel recognized this long ago. "It is of the utmost importance," he said, "that every child should acquire the habit of cultivating a plot of ground. Nowhere as in the vegetable world can his action be so clearly traced by him, entering in as a link in the chain of cause and effect."

**Value of School Gardens.**—What do the children get out of the school garden? The teaching of the child is brought into contact with life, and, best of all, the lives and experiences of the children. The point of contact

reaches the home interests just as directly as those of the school. The tiny garden of the school is sure to be duplicated at the home—probably on a larger scale; and this alone worth the whole effort. The responsibility of the garden develops strength and independence in character. Honest effort wins. Judgment, as well as physical effort and steadfastness of purpose, is demanded.

The first school garden in the United States regularly authorized by a board of education was planted in Boston in 1891, but the value of such school instruction was recognized as early as 1824, when it was argued that "Agriculture and the Gospel are the two great instruments of Divine Providence to check the voluptuousness and exercise the virtues of man." In 1900 vegetables were first planted in this Boston garden. Since that time the development of school gardens and the advancement of agricultural education in the United States have been very great.

**How the School Garden May Become a Vital Part of the School Instruction.**—A few practical illustrations from two of our own American schools will show how the school

garden may become a center of great interest and a vital part of school instruction.

Connected with the school garden is a chicken yard. The children visit it every day, and the subject of the subject in daily conversation with their teacher. This is the story as they told it to her one day:

We went to see Biddy.  
Biddy sat very still.  
She looked at us.  
We stood near Biddy's nest.  
She was not afraid of us.  
We would not hurt her.  
Biddy had eleven little chicks.  
They were white, black, and yellow.  
They said, "Peep, peep, peep."

The teacher wrote these stories on the blackboard as the children told them to her and they became their reading lesson. Then she wrote for them this story on the blackboard and they read it to her:

I think that when a little chicken drinks, he takes the water in his bill.  
And then, he holds his head up so that the water can run down his bill.

The children copied all these sentences on paper and illustrated them with drawings and free-hand cuttings of their own.

The stories were read and reread—many times, with delight. Later the teacher taught them how to tie the leaves together to make a book and they were taken home as a gift to father and mother. Thus the nature-study became through correlation a conversation lesson, a reading lesson, a writing lesson, an art lesson, a number lesson (counting the chickens), training in manual skill (making the book and working out the illustrations), and, above all, an ethical lesson in the noble art of giving.

Another day the children came in with their hands full of flowers. The teacher read them these words and taught them the song: "Consider the lilies of the field, how they grow; they toil not, neither do they spin: And yet I say unto you, that even Solomon in all his glory was not arrayed like one of these. Wherefore, if God so clothe the grass of the field, which to-day is, and to-morrow is cast into the oven, shall he not much more clothe you, O ye of little faith?"

I heard the robin singing  
His happy morning song,  
I saw his help-mate bringing  
Their breakfast to the young;  
And to me came a whisper  
In words that softly fanned the trees:  
"If God for these so careth,  
Will He not care for thee?"

I saw the roses growing  
In beauty day by day;  
No queen in all her glory  
So lovely in array,  
And on the leaves were written  
Sweet words of love and trust for me:  
"If God so doth the rose,  
Will He not care for thee?"

**ARITHMETIC.—First Steps in Number Training.**—Arithmetic in the first three grades is called "number work." It expresses in the simplest way the numbering sense or the counting instinct by which the child first gets hold of quantitative values in his environment. First year number work to the child is largely incidental, though the teacher must have definite aims and purposes. The simplest way to get number ideas in to count small groups of similar objects and find "how many" in a group. The mere rhythm of counting is pleasing to children, counting by 1's to 100; by 10's and 5's to 100; by 2's to 12 or 20; by 3's to 12 or 15; count backward by 1's and 10's. Children will have practical use for this knowledge in connection with games, songs, stories, manual work, and in the daily business of the schoolroom and the home. Through rhymes and jingles as in this *Ten Little Indians* song they have the concrete lesson, the physical exercise and the merry game all in a delightful combination.

One little, two little, three little  
Indians.  
Four little, five little, six little  
Indians.  
Seven little, eight little, nine little  
Indians.  
Ten little Indian boys.

Ten little, nine little, eight little  
Indians.  
Seven little, six little, five little  
Indians.  
Four little three little, two little  
Indians.  
One little Indian boy.

Games in great varieties may be arranged which will bring into exercise this number sense and the delight of dramatization.

Reading and writing numbers may be taught the first year to one hundred and the second year to one thousand. Make practical use of numbers taught, as finding

pages of books, numbers of houses, etc. The teacher must always study her class and suit her pace to theirs.

Teach various forms expressing number relations, as: Three and three are six. Six divided into twos are three twos. Three twos are six. Six less three are three. Two threes are six. One-third of six is two. Six divided into threes are two threes. Two-thirds of six are four.

With the operation teach also the appropriate sign as +, −, =, ×, ÷.

Appropriate combinations for drill should be presented after the child has formed a concrete image of the number relation. He should see one-half and be able to think one-half before he is asked to repeat the statement that one-half of six is three.

**Developing the Idea of Fractions.**—Children easily grasp the idea of fractional parts, but the teacher should keep in mind the completeness of the fractional idea, as Professor David Eugene Smith in his monograph on the teaching of arithmetic has pointed out in the following illustration:

"We should remember that a fraction, say  $\frac{1}{2}$ , is commonly used in three distinct ways, and that it is our duty to see that little by little all these become familiar to the child. These ways are as follows: 1.  $\frac{1}{2}$  of a single object, the most natural idea of all, the breaking of an object into 2 equal parts. 2.  $\frac{1}{2}$  as large, as where a six-inch stick is  $\frac{1}{2}$  as long as a foot rule, not half of it, but half as long as it is. This is essentially the ratio notion, and it is necessary to the child's stock of knowledge, but it is not necessary to make it hard by talking about ratios at this time. 3.  $\frac{1}{2}$  of a group of objects, as in case of  $\frac{1}{2}$  of 10 children."

**New Facts and Processes.**—Whenever new facts and processes have to be learned they should be learned in comparison with known facts. The child should handle and measure and by the aid of drawing get graphic representations of mathematical relationships. Use different magnitudes. Do not neglect to follow up with abstract drill work. Drill, fix, learn. Abstract drill work may be made as interesting as concrete, for all the joy of the game element in education may be made to enter into it.

**Seat Occupation for Number Work in Primary Grades.**—Devices for making number work practical have been worked out in great abundance. Every resourceful teacher has devices of her own. A few have been gathered here as suggestions.

Make pasteboard rulers 4 inches long, a foot long. Mark off into inches. Later mark off into fractions of an inch. Use these rulers in measuring many things. Compare lines, surfaces and solids, with similar lines, surfaces and solids, as. This line is three times as long as that line. This line is one-fourth as long as that line. This rectangle is one-half that rectangle. Find lines and surfaces in the room, and compare. Teach the child to see many things through the one. Unless that which he sees aids him in interpreting something else his observation is of no use to him. Cut, fold, paste, paper furniture according to directions. Paint flags or cut badges of paper for holidays.

Rule lines, squares, oblongs to dictation and scale, sheets for weather record, record sheets, score cards for games. In all construction children should make the necessary computation to get total lengths and breadths and effect of any allowances, e. g., laps in making boxes, for cover of a box compared with the box itself.

Have children measure each other, measure the growth of twigs, make com-

parisons in weights and measures. Arithmetic of a very practical kind is found in nature study, manual training, and in sewing and cooking. Boys and girls in industrial courses must measure and weigh with accuracy and skill.

Construction work when properly taught affords the finest mental discipline. Let children work out their own knowledge and make them personally responsible for their own results. Encourage them to tell what they know in free conversation. Such free work is far more valuable than formal recitation.

**Text-Book.**—A text-book is usually placed in the hands of pupils as early as the second half of the third year. From this time on the teacher follows the outlined course of study. Each year she must see to it the class thoroughly reviews the essential features of the preceding year's work and that such forward steps as are marked out for her grade be intelligently taken. Each year the work involves more difficult combinations and more complicated processes. The exact groundwork to be covered grade by grade differs in different schools according to the course of study outlined by different boards of education, but everywhere the essentials of class work are the same.

**Class Work.**—Cultivate the habit of first grasping the conditions of a problem, what is given, what is required, the relations between the two, the solution. Dictate original problems. Call for restatement of facts and conditions. Let pupil state process without solving. Dictate work slowly and distinctly without repeating. Demand close and lively attention. Call for original problems to illustrate principles. Secure familiarity with arithmetical facts and accuracy and ease of language. Typical problems, from Professor Smith's *Monograph*, to which this article is already under great obligations, have been borrowed here to show the nature of original work that may be done in different grades.

**Two Groups of Problems Given to a Third-Year Class.**—

**Oral Exercise** (without pencil and paper).—

1. The coffee for our breakfast cost 6c, the potatoes 4c, the meat 32c, and the bread 4c. How much did the bread and meat cost? How much did the food cost?
2. The oatmeal for a breakfast cost 8c, the milk 4c, the fruit 10c, the rolls and butter 5c, and the eggs 8c. How much did this food cost?
3. For a dinner the meat cost 30c, the vegetables 20c, the dessert 20c, the coffee 15c, and the other food 15c. Find the total cost.

4. The meals for a small family cost \$1.70 on one day and \$2.20 on another day. How much did they cost for these two days?

**Written Exercise.**—The load is one of man's best friends. One toad will keep a garden of 800 sq. ft. free from harmful insects.

1. At this rate, how many toads would protect from insects a garden 80 ft. wide and 100 ft. long?

2. The eggs of four toads were counted and found to be 7,547, 11,540, 7,927, and 9,536. How many were there in all?

3. If one out of 50 hatched, how many hatched? (Divide all by 50.) If 715 of these were destroyed by other animals, how many survived?

4. If each of these survivors destroys insects that would cause \$10 worth of damage, how much are they all worth to a village?

**Typical Problems for the Fourth or Fifth Grades.**—1. Sarah's mother bought  $4\frac{1}{2}$  yds. of cloth for a coat, at \$1.25 a yd. What did she pay for it?

2. She also bought  $3\frac{1}{2}$  yds. of lining at 50¢ a yd. and  $4\frac{1}{2}$  yds. of braid at 20¢ a yd. How much did these cost?

3. She also bought 6 pearl buttons at \$1.50 a dozen, and 2 spools of silk at 8¢ a spool. How much did these cost?

4. A dressmaker charged \$5 for making the coat. What did the materials and making cost?

**Typical Problems for the Sixth or Seventh Grades.**—1. The following is, by weight, a good mixture of seed for a pasture: Kentucky blue grass 25%, white clover  $12\frac{1}{2}\%$ , perennial rye  $28\frac{1}{2}\%$ , red fescue  $\frac{3}{4}\%$ , reitrop 25%. At 32 lbs. to the acre, how many pounds of each are used?

2. A farmer puts 5 acres into celery, setting out 20,000 to the acre. The yield being 1,500 heads to the acre, what is the ratio of the plants matured to the others?

3. He pays \$85 an acre for seed, fertilizer, labor, and other expenses, and sells the crop at 15¢ a dozen heads. What is his profit on the 5 acres?

An outline of the course in arithmetic in the eighth school year in Munich will show how the German schools are working out some practical ideas for girls who are soon to be the home makers. It is more complete than anything we have yet worked out in America.

The work for the year is as follows: 1. Simple domestic bookkeeping. 2. Calculation of the prices of foods, bought in large or in small quantities, together with the question of discounts. 3. Cost of meals for the home. 4. Daily, monthly, and yearly supplies for the kitchen.

Too much importance cannot be placed upon the nature of the original problems. They enliven class interest and give ample opportunity for correlation with other school subjects and with the livelier interests of the social environment. They should strain the powers of the child to think and compute, but they should not be too hard for him to master them independently. In every way problems should

help the teacher to make school work practical.

**Summary of Suggestions for the Teacher of Arithmetic.**—1. There are a few things primarily essential in arithmetic that should be learned by every child. He should think in numbers as readily as he thinks in other subjects. He should be ready to execute his thought with quickness and precision.

2. Drill and repetition for accuracy and speed should be given day after day that the child may early master the mechanical difficulties of the subject, but drill should not become a lifeless mechanical repetition; it should be so varied as to produce thought and animation.

3. Such processes as addition, subtraction, multiplication, and division should be mastered early. Often much time is wasted in the upper grades learning facts and processes that should have been mastered in the lower grades when the child is passing through the stage in which this work can be done most easily.

4. The introduction of too many topics at a time should be avoided. The pupil should be required to meet but one difficulty at a time.

5. Begin with the concrete, then drill on number facts and processes. In the primary grades teach number facts for the most part in connection with the study of other subjects. Use material drawn from the number side of school experience and the simpler and more evident relation of home life. The continued use of any particular set of objects is tiresome and narrowing.

6. It is important to use objects freely whenever they assist in understanding number relations, but care should be taken not to fetter the mind with objects when it is ready for the abstract. Pass from observation to reasoning, from concrete to abstract, from facts to principles, from particular to general, and, very slowly, from the simple to the complex. The child passes through the stage of objects to that of representation of objects, to that of symbols. Noticeable progress begins when he can think of things not present to his senses.

7. In the intermediate grades emphasis should be laid upon the scientific aspects of the work, that is, rules and principles, in order to secure mastery of fundamental operations of numbers.

8. In the grammar grades considerable attention should be paid to the use of numbers in connection with the commercial and industrial activities of the community. Practical problems for all grades should be taken from industrial life.

9. In the working out of problems the child should be taught from the beginning to determine for himself the approximate results, appeal being made to the common sense check "Is this result reasonable?" "Does it agree with the conditions?"

10. Problems of graded difficulty should be given in all classes in order that even the weakest pupil may find enough that he can do to keep him trying. The exercise should bring in all the primary combinations of numbers and all the fundamental processes. The tendency to overuse a few combinations at the expense of others must be guarded against.

11. The teacher must exercise judgment as to the amount of written work. Oral expression should always precede written. In primary grades number work is largely given orally—good, clear, well worded expression. A little work well done is much better than a large amount of work over-hurried.

12. Insist upon neatness and a proper statement of steps taken.

13. Accuracy, facility, orderly arrangement, self-reliance, are cardinal virtues in number work.

14. In the assignment of work, assign some purely for drill and some purely to train the reasoning powers. If reasoning is difficult, mechanical processes should be simple.

15. Aim to obtain efficiency through the discipline of numbers. "The prime desideratum," it has been said, "is the ability to work accurately, with reasonable rapidity and with interest, and to know how to apply numbers to the ordinary affairs of life." There is moral value in the integrity of numbers that "cannot lie."

## PRACTICAL HELPS IN ARITHMETIC

### ADDITION AND SUBTRACTION

The following plan is suggested in teaching the combinations in addition and subtraction:

1. Add 1 to every number up to 10; later to 20.

2. Subtract 1 from every number up to 10; later to 20.

3. Add 2 to 1, 2 to 2, 3 to 3, 4 to 4, 5 to 5, 6 to 6, 7 to 7, 8 to 8, 9 to 9.

4. Add 3 to 1, 4 to 2, 5 to 3, 6 to 4, 7 to 5, 8 to 6, 9 to 7.

5. Add 4 to 1, 5 to 2, 6 to 3, 7 to 4, 8 to 5, 9 to 6.

6. Add 5 to 1, 6 to 2, 7 to 3, 8 to 4, 9 to 5.

7. Add 6 to 1, 7 to 2, 8 to 3, 9 to 4.

8. Add 7 to 1, 8 to 2, 9 to 3.

9. Add 8 to 1, 9 to 2.

10. Add 9 to 1.

11. Add 10 to 0.

12. Teach the corresponding subtractions.

13. Review and give combinations not taught above.

**Note.**—Objects should be grouped by tens and units, in showing numbers above 10. The numbers written should represent objects counted.

### The Forty-Five Facts of Addition

1	2	3	4	5	6	7	8	9	10
1	2	3	4	5	6	7	8	9	10
2	3	4	5	6	7	8	9	10	11
3	4	5	6	7	8	9	10	11	12
4	5	6	7	8	9	10	11	12	13
5	6	7	8	9	10	11	12	13	14
6	7	8	9	10	11	12	13	14	15
7	8	9	10	11	12	13	14	15	16
8	9	10	11	12	13	14	15	16	17
9	10	11	12	13	14	15	16	17	18
10	11	12	13	14	15	16	17	18	19
11	12	13	14	15	16	17	18	19	20
12	13	14	15	16	17	18	19	20	21
13	14	15	16	17	18	19	20	21	22
14	15	16	17	18	19	20	21	22	23
15	16	17	18	19	20	21	22	23	24
16	17	18	19	20	21	22	23	24	25
17	18	19	20	21	22	23	24	25	26
18	19	20	21	22	23	24	25	26	27
19	20	21	22	23	24	25	26	27	28
20	21	22	23	24	25	26	27	28	29
21	22	23	24	25	26	27	28	29	30
22	23	24	25	26	27	28	29	30	31
23	24	25	26	27	28	29	30	31	32
24	25	26	27	28	29	30	31	32	33
25	26	27	28	29	30	31	32	33	34
26	27	28	29	30	31	32	33	34	35
27	28	29	30	31	32	33	34	35	36
28	29	30	31	32	33	34	35	36	37
29	30	31	32	33	34	35	36	37	38
30	31	32	33	34	35	36	37	38	39
31	32	33	34	35	36	37	38	39	40
32	33	34	35	36	37	38	39	40	41
33	34	35	36	37	38	39	40	41	42
34	35	36	37	38	39	40	41	42	43
35	36	37	38	39	40	41	42	43	44
36	37	38	39	40	41	42	43	44	45

**Note.**—Be sure that the nine facts underscored are thoroughly learned. They give most trouble.

## Drills in Addition

Draw on a sheet of paper a large square and a circle. Divide them like these. Put, say the figure 8, in the center with the other numbers around it.

Write any figure in the center where the 8 is. Then drill, by pointing to the figures around it, while the child names at once the sum of the center figure and the one pointed at.

Use exercises like this frequently, and give many problems, using the combinations with which you find the child has difficulty.

Exercises in which the child counts by 2's, by 3's, etc., to 100 are valuable.

## Proving Addition

You may early teach how to prove an addition. There are a number of ways of doing this. Use the way the child's teacher uses. It is a good way.

## One Way

Add the columns down. If the result is the same as when the columns were added up, the result is correct.

## Second Way

Write the numbers in two groups. Find the sum of each group. Add the sums of the two groups. If the result is the same as when the numbers were added in one group, the result is correct.

## Illustration of second way:

$$\begin{array}{r} 273 \\ 456 \\ \hline 729 \end{array} \quad \begin{array}{r} 273 \\ 456 \\ \hline 729 \end{array}$$

$$\begin{array}{r} 629 \\ 384 \\ \hline 1013 \end{array} \quad \begin{array}{r} 629 \\ 384 \\ \hline 1013 \end{array}$$

$$\begin{array}{r} 1742 \\ 31225 \\ \hline 32967 \end{array}$$

$$\begin{array}{r} 1742 \\ 31225 \\ \hline 32967 \end{array}$$

This is a modification of the plan called *casting out the nines*.

## Illustration

$$\begin{array}{r} 7020-24-6 \\ 4356-18-9 \\ 1824-15-6 \\ 9263-20-2 \\ 7856-26-8 \\ \hline 31225-13-4 \end{array} \quad \begin{array}{r} 7020-24-6 \\ 4356-18-9 \\ 1824-15-6 \\ 9263-20-2 \\ 7856-26-8 \\ \hline 31225-13-4 \end{array} \quad \begin{array}{r} 7020-24-6 \\ 4356-18-9 \\ 1824-15-6 \\ 9263-20-2 \\ 7856-26-8 \\ \hline 31225-13-4 \end{array}$$

## Explanation

First add the columns in the regular way. Add each column horizontally, left to right. The results are 24, 18, 15, etc. Add these horizontally and you have 6, 9, 6, etc.

You have now reduced all to one column. Take the sum of this column. It is 31. This added horizontally is 4.

Add the sum 31225 horizontally until you have but one figure in it and you also have 4. This proves your answer correct.

## Another Illustration

This illustrates where it is necessary to carry the horizontal additions a step further:

$$\begin{array}{r} 996745-39-12-3 \\ 728324-34-6-6 \\ 916349-31-4-4 \\ 929773-39-12-3 \\ \hline 3622390-25-7-7 \end{array} \quad \begin{array}{r} 996745-39-12-3 \\ 728324-34-6-6 \\ 916349-31-4-4 \\ 929773-39-12-3 \\ \hline 3622390-25-7-7 \end{array} \quad \begin{array}{r} 996745-39-12-3 \\ 728324-34-6-6 \\ 916349-31-4-4 \\ 929773-39-12-3 \\ \hline 3622390-25-7-7 \end{array}$$

Note.—With some practice it will be necessary to write the last line of figures only.

## Rapid Adding Exercises

When pupils have learned to add they quickly acquire skill by an occasional rapid adding exercise. A few minutes serves the purpose.

It may be made competitive by each pupil writing the numbers and at a given signal beginning the addition.

Slow and correct work is preferable to rapid work that is incorrect. Incorrect work is of no value here.

## Civil Service Method of Adding

Employees under the civil service bureau, bank clerks, and others who perform additions while surrounded by people engaged in conversation, use the following method in their additions.

This method is safe because one can detect and change an error very quickly.

\$5290	10
9760.50	19
349	21
4006.75	23
6522.89	18
132.12	24
	\$20,061.26

## The Banker's Method of Adding

This method is the same as that used by the civil service employees, with one change. In adding the columns the number carried is "added in" to each partial sum.

\$5290	10
9760.50	23
349	21
4006.75	25
6522.89	28
132.12	26
	\$20,061.26

The banker's method is an improvement on the civil service method as it does not require a second addition. The number to be carried is always in sight in the banker's method, being the tens figure of the last partial sum written. The sum can be written at once.

## SUBTRACTION

The differences of all these combinations should be learned so thoroughly that the pupil will be able to name difference of any combination at sight. This will take time, but it is time well spent.

Use devices similar to those used in the drills on the addition table.

Give many problems for oral work. Let the pupil make many problems and give the difference in each case.

## Combinations in Subtraction

1	2	3	4	5	6	7	8	9	10
-1	-1	-1	-1	-1	-1	-1	-1	-1	-1
-2	3	4	5	6	7	8	9	10	11
-2	-2	-2	-2	-2	-2	-2	-2	-2	-2
3	4	5	6	7	8	9	10	11	12
-3	-3	-3	-3	-3	-3	-3	-3	-3	-3
4	5	6	7	8	9	10	11	12	13
-4	-4	-4	-4	-4	-4	-4	-4	-4	-4
5	6	7	8	9	10	11	12	13	14
-5	-5	-5	-5	-5	-5	-5	-5	-5	-5
6	7	8	9	10	11	12	13	14	15
-6	-6	-6	-6	-6	-6	-6	-6	-6	-6
7	8	9	10	11	12	13	14	15	16
-7	-7	-7	-7	-7	-7	-7	-7	-7	-7
8	9	10	11	12	13	14	15	16	17
-8	-8	-8	-8	-8	-8	-8	-8	-8	-8
9	10	11	12	13	14	15	16	17	18
-9	-9	-9	-9	-9	-9	-9	-9	-9	-9
10	11	12	13	14	15	16	17	18	19
-10	-10	-10	-10	-10	-10	-10	-10	-10	-10

## The Computer's Method

In making change, the method below is nearly always used. Computers find it the more practical way. It gives greater rapidity and accuracy than the other method.

Many of the best teachers use it alone in teaching subtraction.

This plan is called the Austrian method by some.

## Example

Find the difference between 725 and 432.

## Work:

725

432

293

293

293

293

293

293

293

293

293

293

293

293

293

293

293

293

293

293

Use that method with these examples:—

42,238	2934	7925	8743
-17,345	-1469	-1504	-1428
35,091	678	6771	4818

Note.—With practice the pupil will come to prefer this method and should be helped in its use. It is practical since conducive to both rapidity and accuracy.

## Proofs of Subtraction

To prove a subtraction add the subtrahend to the remainder. The result will be the minuend if the work is correct.

<i>Example</i>	<i>Proof</i>
435 minuend	173
— 173 subtrahend	333
262 remainder	425

425 is the same as the minuend, hence the work is correct.

## Another Proof

Take the remainder from the minuend. If the work is correct the subtrahend will be left.

If in the last example given we write  
435  
— 262

we get 173, which is the subtrahend used above, hence the work is correct.

Note.—Either proof may be used. Show the child why these two proofs are true. Use small numbers to do this like 7—2. Later use larger ones.

## NUMBER STORIES IN MULTIPLICATION

## Example

3 X 4 = —

## Facts Given by Child

3 X 4 means 3 4's.

I count my blocks by fours—I take 1 four, another, another.

I find that 3 4's are 12.

3 X 4 = 12.

## To the Teacher

Now the child is ready to give a number story about 3 X 4.

Note.—If the pupil is in doubt about any part of the work in number stories, he should use objects, and then practice much without them.

## Drills in Multiplication

The drill opposite is very good and effective, if a rapid answering exercise is made of it. Products should be given at once.

To vary it use squares.

Draw a diagram like this one and let the pupil fill in the squares with the proper products. Fix a time limit. Have results put in quickly.

1	2	3	4	5	6	7	8	9
2								
3								
4						28		
5								
6								
7						42		
8								
9								
10								

$$\begin{array}{r} 4 \times 1 = 4 \\ 4 \times 2 = 8 \\ 4 \times 3 = 12 \end{array}$$

$$\begin{array}{r} 7 \times 1 = 7 \\ 7 \times 2 = 14 \\ 7 \times 3 = 21 \end{array}$$

Make diagrams like these,

and let the pupils fill them in.

In this work it is not intended that the pupil should at first learn "his tables" in order, the 2's first, then the 3's, then the 4's, etc. He remembers many of the facts of multiplication from his primary work in numbers. These drills are to complete and fix firmly in the pupil's mind the completed multiplication tables.

## Proofs in Multiplication

## The Multiplication

$$\begin{array}{r} 43 \\ \times 25 \\ \hline 215 \\ 860 \\ \hline 1065 \end{array}$$

## The Proof

$$\begin{array}{r} 25 \\ \times 43 \\ \hline 75 \\ 1000 \\ \hline 1065 \end{array}$$

The proof consists merely in reversing the positions of the multiplicand and multiplier, and performing the multiplication in the usual way. If the product is the same in both cases the work is correct.

## PRIMARY IDEAS OF DIVISION

In teaching the two ideas of division—division by measurement (division proper) and the fractional idea of division (partition)—proceed very slowly and see that each step is thoroughly understood.

The following suggestions may be useful:—

## Division by Measurement

Use colored blocks or any other counters in illustrating the process.

## Example

$$4 \overline{) 12}$$

The teacher should ask the child, "How would you count this story?"

## Facts Given by Child

12 = whole number of blocks.

4 = number in each part.

We want to know the number of parts.

We place the blocks so, 4 in each part:—

There are 3 parts.

## Division by Partition

Make use of colored blocks or substitutes to show the process here.

## Example

$$\frac{1}{4} \text{ of } 12 = 3$$

The teacher should ask the child, "How would you count this story?"

## Facts Given by Child

12 = whole number of blocks.

4 = number of parts.

We want to know the number in each part.

We place the blocks so, as we know there are 4 parts:—

We have put one in each part.

Now we will put one in each part until the 12 blocks are gone:—

There are 3 in each part.

## The Three Uses of Division

## First Use Explained (Partition)

What is  $\frac{1}{4}$  of 24 cents?

Here 24 cents is the sum of money to be divided. It is to be divided by

4. The result shows the size of each part.

Number of equal parts 4) 24¢ money to be divided.

6¢ size of each part.

**Second Use Explained (Division by Measurement)**

How many times is 8 cents contained in 32 cents?  
Here 32 cents is the sum of money to be divided. The size of each part is 8 cents, and the result gives the number of equal parts.  
Size of each part 8c. Size money to be divided.

**4 number of equal parts.****Third Use Explained (Ratio Idea)**

There are 36 acres in one lot and 9 acres in another. The first lot is how many times as large as the second?

From division we know that 36 acres contains 9 acres 4 times. Then 36 acres is 4 times as large as 9 acres; or, 36 acres is to 9 acres as 4 is to 1 acre.

Note.—This on the ratio idea leaves the impression that the other work does not embrace the ratio principle. Any comparison of numbers embraces the ratio idea.

**Division Drills**

It is well to use drills of different kinds to help fix the facts of the division table in mind. At no time, at this stage, are you sure that the pupil remembers from one day to the next.

Diagram drills are given here as suggestive of what may be made use of. Use other numbers in order to get drill on the whole division table.

Be sure to make the drill work brisk and of short duration.

**The Drill**

The teacher points to any of the numbers in the small squares and the child answers simply the quotient number. Skip about rapidly. Draw the same diagram on the blackboard and frequently change the fraction in the center square.

Allow no "thinking out" of results. The child should have the table at his tongue's end.

Change center fraction repeatedly.

The supreme test of his mental activity is to think quickly and tell correctly.

**Proofs in Division**

The best way to prove work in division is to multiply the quotient by the divisor and add the remainder, if there is one.

The result will equal the dividend if the work is correct.

Divide 600,181 by 937.

600181

**READING NUMBERS**

When we spell a word, that is, when we read the letters in the word, we read from left to right.

To read a number we do the same thing for we read the figures from left to right.

The number is read differently if we wish to tell the place and value of a certain figure, for then we read the figures themselves from right to left.

325 means 3 units, 2 tens, 3 hundreds.

Never use "AND" in reading whole numbers.

325 should never be read "three hundred and twenty-five," but "three hundred twenty-five."

Numbers between 100 and 1000 are read by naming the hundreds, tens, and units in succession. Thus—

192—one hundred ninety-two.

652—six hundred fifty-two.

207—two hundred seven.

Above 1000

Read 1,902,632.

Here the 2 represents 1's, or units of the first order.

the 3 represents 10's, or units of the second order.

the 6 represents 100's, or units of the third order.

the 2 represents 1000's, or units of the fourth order.

the 9 represents 10000's, or units of the sixth order, etc., etc.

The order of any figure is the number of its place, starting from the right.

In reading large numbers we arrange the orders into groups of three figures each.

We call each group a period. Commas are used to keep the periods separate.

Names of the Periods					
units,	billions,	quintillions,	octillions,	nonillions,	units
thousands,	trillions,	trillions,	trillions,	trillions,	
trillions,	billions,	millions,	thousands,	units	
225,	967,	307,	472,	399,	

**FACTS ABOUT ROMAN NUMERALS**

The following facts about the origin and development of Roman notation can be made very interesting, and will tend to fix the characters in one's mind—

At first one was written I,

two was written II,

three was written III,

four was written IIII,

five was written IIIII,

six was written IIII I,

seven was written IIII II,

eight was written IIII III,

nine was written IIII IIII.

It took too long to make ten marks, and too long to count them after they were made, so one mark with another across it was used to denote 10, thus X.

The upper or first half of the X, or V, was used to show 5.

At first twenty was written XXX,

thirty was written XXXI,

forty was written XXXII,

fifty was written XXXIII,

sixty was written XXXIII I,

seventy was written XXXIII II,

eighty was written XXXIII III,

ninety was written XXXIII IIII.

It took too long to make the crosses and too long to count them in reading, so L was used to show 50. Half of the E or L was used to show 50. The L gradually became C in trying to make the E rapidly.

Write these where the child can see them plainly

I = 1	XX = 20	XXXIX = 39
II = 2	XXI = 21	XLI = 41
III = 3	XXII = 22	XLII = 42
IV = 4	XXIII = 23	XLIII = 43
V = 5	XXIV = 24	XLIV = 44
VI = 6	XXV = 25	XLV = 45
VII = 7	XXVI = 26	XLVI = 46
VIII = 8	XXVII = 27	XLVII = 47
IX = 9	XXVIII = 28	XLVIII = 48
X = 10	XXIX = 29	XLIX = 49
XI = 11	XXX = 30	L = 50
XII = 12	XXXI = 31	LX = 60
XIII = 13	XXXII = 32	LXI = 61
XIV = 14	XXXIII = 33	LXII = 62
XV = 15	XXXIV = 34	LXIII = 63
XVI = 16	XXXV = 35	LXIV = 64
XVII = 17	XXXVI = 36	LXV = 65
XVIII = 18	XXXVII = 37	LXVI = 66
XIX = 19	XXXVIII = 38	LXVII = 67
	XXXIX = 39	LXVIII = 68
		LXIX = 69
		LXX = 70
		LXXI = 71
		LXXII = 72
		LXXIII = 73
		LXXIV = 74
		LXXV = 75
		LXXVI = 76
		LXXVII = 77
		LXXVIII = 78
		LXXIX = 79
		LXXX = 80
		LXXXI = 81
		LXXXII = 82
		LXXXIII = 83
		LXXXIV = 84
		LXXXV = 85
		LXXXVI = 86
		LXXXVII = 87
		LXXXVIII = 88
		LXXXIX = 89
		LXXXX = 90
		LXXXXI = 91
		LXXXXII = 92
		LXXXXIII = 93
		LXXXXIV = 94
		LXXXXV = 95
		LXXXXVI = 96
		LXXXXVII = 97
		LXXXXVIII = 98
		LXXXXIX = 99
		LXXXXX = 100

**PRIME NUMBERS**

Some numbers, like 3, 5, 11, etc., can only be divided by themselves and unity. As they cannot otherwise be factored, we call them prime numbers.

**Prime Numbers from 1 to 1000**

(Use This Table for Reference)

1	59	139	233	337	439	537	633	709	883
2	61	149	239	347	443	543	639	713	887

**SIMPLE MEASURES—For the Child to Learn Objectively**

- 2 pints make 1 quart.
- 8 quarts make 1 peck.
- 4 pecks make 1 bushel.
- 7 days make 1 week.\*
- 16 ounces make 1 pound.
- 12 inches make 1 foot.
- 3 feet make 1 yard.
- 12 things make 1 dozen.
- 5 cents make 1 nickel.
- 10 cents make 1 dime.

**LONG MEASURE**

Teach the child to estimate distances and then to verify every estimate by actual measurement.

Teach half inches as well as inches.

**For the Child to Do**

1. Cut a strip of paper 12 inches long and 1 inch wide.
2. Mark the inches on it.
3. How many inches long is it?
4. What do you call a measure 12 inches long?
5. Draw a line 2 inches long, as near as you can, without using a ruler.
6. Measure it with a ruler. Did you guess nearly right? Try again.
7. Measure this paper. How long is it? How wide?
8. Draw a line on the ground 1 yard long.
9.  $\frac{1}{2}$  of a foot is how many inches?
10. 1 yard is how many inches? What is measured by the yard?

\*Objectively so far as pointing it out on a calendar.

11. Ask your mother how many yards of cloth she needs for a dress.  
12. What is measured by the foot?  
13. How tall are you?

## PRIMARY IDEAS OF TIME

Turn to the paragraph on Roman numerals and note the facts about them. 60 minutes make 1 hour. 12 hours make 1 half day. 24 hours make 1 day.

A new day begins at midnight and lasts until next midnight.

One hour after midnight is 1 o'clock. 2 hours after midnight is 2 o'clock, and so on, until 12 o'clock at noon.

At noon one-half the day has gone and we begin the afternoon, which is the last half of the day.

One hour after noon is 1 o'clock, 2 hours after is 2 o'clock, etc.

If a person says he was at a certain place at 2 o'clock, he must say forenoon or afternoon, so we will know which half of the day he means. If it was 2 o'clock in the morning he would write 2 a. m., and if 2 o'clock in the afternoon, 2 p. m.

## How to Teach a Child to Tell Time

First—Teach him to tell the hour hand from the minute hand.

Next—Teach him when he first looks at the dial, to find the hour hand and then notice which Roman numeral it is nearest. This will tell about what time it is.

Then—Find the minute hand. The minute hand will tell exactly what time it is.

## To Illustrate

Take this clock. The hour hand is near the Roman numeral II, which stands for 2. Tell the child it is somewhere near two o'clock. The minute hand will tell how near.

It must always point to the XII before it is exactly the hour. If it is one numeral away from the XII, toward the left, it is 5 minutes of two. If it is two numerals away to the left, it is 10 minutes of two, etc. If it is one numeral away to the right, it is 5 minutes after two, etc. Proceed in this way and keep at it.

## LIQUID MEASURE

If you have quart and pint measures allow the child to empty water from one to the other.

On teaching the table of liquid measure proceed in this manner—

Here is a gill cup. I am going to fill it to see how many gills make a pint. Now I have poured one gill, now two, now three, now four. Is the pint cup full? How many gills in a pint?

Let us prove what you say by pouring the water back. One gill; two gills; three; four. Were we right then?

Let us write what we have just said and proved—

4 gills = 1 pint.

Proceed in this way with the other measures, only let the child do more of the work for himself.

## MONEY

Use actual coins in teaching money. Lessons on money should be given frequently after the first year of school life.

Begin by teaching the value of the cent and the nickel, then the dime, then the quarter, then the half-dollar, and then the dollar.

Make problems involving change. Develop the ability to make change rapidly. The child may have some money of his own and he should be taught

the comparative values of the coins. The correct method of making change follows.

- 10 cents make 1 dime.  
2 five-cent pieces make 1 dime.  
100 cents make 1 dollar.  
A quarter of a dollar = 25 cents.  
A half-dollar = 50 cents.

\$ means dollars and c means cents.  
A five-cent piece is called a nickel because it is made of nickel.  
A cent piece is made of copper.  
The other coins named are made of silver.

## HOW TO MAKE CHANGE

First—Name the cost of goods.

Then—Add enough money to make even money.

Last—Add the large coin.

## To Illustrate

I bought some cloth for 35c and gave the clerk 50c. Count my change.

How to count it—

35c for cloth

And 5c makes 40c (to make even money)

And 10c makes 50c.

## To Illustrate

I buy suspenders for 32c and give the clerk \$1. Count my change.

How to count it—

32c for suspenders

And 3c makes 35c

And 5c makes 40c

And 10c makes 50c

And 50c makes \$1

(to make even money)

Note.—Think of it in this way—32c, 35c, 40c, 50c, \$1.

## THE CALENDAR

1903 July 1903

## SQUARE MEASURE

How long is each side of the figure opposite?

How many squares in the figure?

Because each square is one inch on each side, we call it a square inch.

How many square inches in the whole figure?

The number of squares is called the area.

4 square inches is the area of this figure.

1 SQUARE  
INCH

Show by a drawing how many square inches in a figure 3 in. wide and 9 in. long.  
 Its area is 27 square inches.  
 We need not always draw a figure to get the area.  
 You will notice that the length times the width will give the number of squares in the figure.  
 Find the area of a figure 9 in. long and 6 in. wide, without a drawing. What did you do? *Makes a rule.*  
 Cut out a piece of paper 1 in. wide and 4 in. long. Cut it into square inches. Place the cut squares so as to form a large square. How long is it now? How wide? (See section on weights and measures for advanced tables.)

## PRIMARY IDEAS CONCERNING DRY MEASURE

8 quarts make a peck (pk.).  
 4 pecks make a bushel (bu.).

Dry measure is sometimes used to measure dry articles. Formerly grains, vegetables, and fruit of all kinds were bought and sold by dry measure.  
 Don't teach the child, as most arithmetics say, that grains, fruits, and vegetables are bought and sold by the measured bushel. They are not.  
 The weight bushel, the case, and the box have come into common use for these articles.

Teach the names of the measures before you attempt to teach the number of one measure in another, etc.

## SIMPLE FRACTIONS

A very good method of teaching the combinations in small fractions is by the use of paper or cardboard disks. (Children may call them circles.)  
 Cut out a large number of them, and, in order to avoid trouble later on, it might be better to have the disks all of one size—about 6 inches in diameter.

Teaching the Fraction  $\frac{1}{2}$  with Disks

Say to the child:  
 I am going to cut this circle into two equal parts. What is this part called? What is this other part called? How many halves in the whole circle? One-half and one-half are what? One-half taken away from one leaves what? If I take a half (one time), what do I get? How many halves in a whole?

Now I will write these—

$$\frac{1}{2} + \frac{1}{2} = 1 \quad \text{1 divided by } \frac{1}{2} = 2$$

$$1 \text{ less } \frac{1}{2} = \frac{1}{2} \quad 1 + 2 = 3$$

$$2 \times \frac{1}{2} = 1 \quad 1 - \frac{1}{2} = \frac{1}{2}$$

Give me the answers and I will write them.

Drawings showing the "placing" of disks for number stories can be made by the child; as,

$$\frac{1}{2} + \frac{1}{2} = 1$$

$$\frac{1}{2} \div \frac{1}{2} = 2$$

Ask the child to make similar drawings to tell about halves.

Proceed like this—How many thirds in a pie? If a pie cost 10 cents, what will half a pie cost? Who can tell other stories about halves? etc.

Teach fourths along with halves.

Teaching the Fraction  $\frac{1}{3}$  with Disks

Cut several disks into thirds. Have the child practice on cutting, so that he will be able to make the three parts of each disk equal.

Then proceed like this—What do you call each of these parts? Why are they called thirds? How many thirds in a circle? I am going to take a circle and cut it any way, so as to make three parts; do I call these unequal parts thirds? Why not? Let me write one-third on a piece of paper for you. (Write,  $\frac{1}{3}$ .) Draw a circle for me. Instead of cutting it, draw lines where you would cut it to make thirds. Write one-third ( $\frac{1}{3}$ ) on each third of a circle. I write this ( $\frac{1}{3} + \frac{1}{3}$ ). Who can tell me what the answer is? Are two-thirds and two-thirds more than one? How much more? I have two-

thirds of an apple and give Mary one-third, how much have I left? Who can give other story problems about thirds? Everybody try, etc.

Teach sixths along with thirds. Use disks, dots, marks, sticks, and inches to illustrate.

Remember that no advance should be made until each little part is understood.

Teaching the Fraction  $\frac{1}{6}$  with Disks

Have fifths compared with fourths, thirds, and halves.

Be sure that the child sees that the number below the line shows the size of each part and the number above how many parts are taken.

Have the child illustrate every step with drawings. If at any time he cannot answer results at sight, let him show the work with disks.

Say to the child:

I am going to cut this circle into five equal parts. What is each part called? How many fifths in the whole circle? How many thirds here? (Show two-fifths.) One-fifth and one-fifth are how many fifths? One less two-fifths is what? If I take three-fifths, how many times one-fifth do I take? How many times one-fifth are left? Are two-fifths greater than one-third?

Give and ask for story problems and number stories telling about fifths.

Teach tenths along with fifths.

When twelfths are taught, show the relations between twelfths and sixths, fourths, thirds, and halves.

## Equal Fractions in Different Forms

Have the child see how fractions may differ in form but still remain the same in value.

Begin with his knowledge of smaller fractions, as,

$$\frac{1}{2}, \frac{2}{4}, \frac{3}{6}, \text{ and } \frac{4}{8} \text{ of an apple}$$

Let him show by the use of drawings that fractions may have large or small terms but be equal in value.

## Things for the Child to Do

Fill out the numerators in the following fractions and prove each by a drawing:—

$$1. \frac{1}{2} = \frac{2}{4} = \frac{4}{8} = \frac{8}{16}$$

$$2. \frac{1}{5} = \frac{2}{10} = \frac{3}{15} = \frac{4}{20}$$

$$3. \frac{1}{8} = \frac{2}{16} = \frac{3}{24} = \frac{4}{32}$$

$$4. \frac{3}{4} = \frac{6}{8} = \frac{9}{12} = \frac{12}{16}$$

$$5. \frac{2}{5} = \frac{4}{10} = \frac{6}{15} = \frac{8}{20}$$

## PRINCIPLES OF FRACTIONS

1. A fraction's value is the quotient obtained by dividing the numerator by the denominator.

$$\frac{6}{2} = 3 \quad 3 \text{ is the value of } \frac{6}{2}$$

$$\frac{2}{3} = \frac{2}{3} \quad \frac{2}{3} \text{ is the value of } \frac{2}{3}$$

2. Multiplying the denominator of a fraction divides the fraction by that number.

$$\frac{1}{2} \times 4 = \frac{1}{8} \quad \frac{3}{7} \times 3 = \frac{3}{21} \quad \frac{2}{3} \times 9 = \frac{2}{27}$$

3. Dividing the denominator of a fraction multiplies the fraction by that number.

$$\frac{3}{8} \div 4 = \frac{3}{2} \quad \frac{10}{9} \div 3 = \frac{10}{3} \quad \frac{3}{10} \div 5 = \frac{3}{2}$$

4. Multiplying the numerator of a fraction multiplies the fraction by that number.

$$\frac{2}{3} \times 2 = \frac{4}{3} \quad \frac{1}{6} \times 8 = \frac{8}{6} \quad \frac{5}{6} \times 3 = \frac{15}{6}$$

5. Dividing the numerator of a fraction divides the fraction by that number.

$$\frac{4}{7} \div 2 = \frac{2}{7} \quad \frac{12}{7} \div 12 = \frac{1}{7} \quad \frac{3}{7} \div 3 = \frac{1}{7}$$

6. Multiplying both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$$\frac{1 \times 3}{3 \times 3} = \frac{3}{9} = \frac{1}{3} \quad \frac{6 \times 2}{7 \times 2} = \frac{12}{14} = \frac{6}{7}$$

7. Dividing both numerator and denominator of a fraction by the same number does not change the value of the fraction.

$$\frac{12 \div 3}{15 \div 3} = \frac{4}{5} = \frac{12}{15} \quad \frac{18 \div 9}{27 \div 9} = \frac{2}{3} = \frac{18}{27}$$

## NATURE STUDY AND ELEMENTARY AGRICULTURE.

—Elementary agriculture in the country schools should include the fundamental principles of agricultural practice, illustrated in large measure by such laboratory and field work as will be directly and immediately helpful and practical on the farms in the midst of which the school is located. Through the teaching of elementary agriculture in the country schools, the introduction of such needed reforms as seed improvement, improved culture of soils, and the checking of waste, is entirely practicable and possible. Since the country school term does not extend throughout the whole year, the work in agriculture cannot be very satisfactorily unified upon the basis of farm operations in season, yet there are certain topics best studied at each season of the year when first-hand contact with materials is possible. The following topics as outlined in Nolan's *One Hundred Lessons in Elementary Agriculture* suggest a course for a year's work.

**Topics for Autumn Months.**—1. Composition of soils. 2. Relation of soils to water. 3. Fertilizers. 4. Seeds and their germination. 5. Selecting and storing seed corn. 6. Tree planting. 7. Weeds. 8. Insects. 9. Fruits. 10. Pastures. 11. Agricultural clubs. 12. Storing fruits and grains for winter.

**Topics for Winter Months.**—1. Judging seed corn. 2. Elements of forestry. 3. The horse and its care. 4. The cow. 5. Milk and butter. 6. Sheep, hogs, poultry, etc. 7. Feeding and care of farm animals. 8. Comparative studies of agricultural products of various states. 9. Crop records and farm bookkeeping. 10. Roads, rural mail, parcels post, etc. 11. Farm machinery, fences, etc. 12. Farm buildings.

**Topics for Spring Months.**—1. Testing seed corn. 2. Hot-beds. 3. Gardening. 4. Cultural requirements for vegetables. 5. Beautifying home grounds. 6. Pruning. 7. Budding, grafting, etc. 8. Spraying for scale and codling moth. 9. Plowing, harrowing, and cultivating. 10. The potato crop. 11. Transplanting. 12. Valuable birds to agriculture. 13. Sowing farm crops.

In teaching the topics suggested above the aim should be to bring out the essential principles involved in the practice, and to lead the pupils to first-hand contact with the material in as many ways as possible. The country school-teacher should strive in each case to have the lesson tried out on the pupil's home farm. The aim of each lesson should be definite, to bring out and apply one single principle relating to the topic in hand.

An excellent method to unify and organize the work of elementary agriculture in the country schools is for the pupils and teacher to imagine that they have just purchased an unimproved forty acres of land, or perhaps better still, select a forty-acre field near the school grounds, and in theory manage it for one year. Require each pupil to provide a good permanent notebook and keep a record of every detail of procedure as the farm is selected, laid out, equipped with buildings, planted, cultivated, and managed throughout an imaginary year. The practices that would properly come next in point of time in the actual management of such a farm would furnish order and sequence for the topics of study and practical exercises through-

out the school course. In this method the pupil should be required to read all the farm papers, bulletins and books available, and keep a diary record of an imaginary year of actual farming.

Such a course in elementary agriculture could be well adapted to the seventh and eighth grades. Three recitations a week would be sufficient for introducing the subject, giving the last half hour of the school program to this subject.

### Suggested Lessons for School and Farm.

—The most helpful method of conducting experiments and developing the outlines that follow is to assign to a certain pupil or group of pupils the responsibility of working out the particular tests that are to be made. From parents, and from books and bulletins with which the school library is supplied, the children gather any and all information possible bearing upon the subjects under study. After free class discussion and much questioning of the pupils, the class and teacher should together work out a simple outline according to which the children will write the results of their study and observations in composition form. Some of these productions should be read in class; all errors both in fact and in English should be noted, but the compositions need not be rewritten. The sheets as first written can be put together in booklets with original designs covers. This disposition of the compositions furnishes excellent motive for careful and correct composition work and a basis for prize and competitive contests.

Alertness on the part of the teacher for the practical and everyday problems that are constantly presenting themselves to the intelligent farmer will keep an industrious teacher busy finding room for the discussion and solution of the problems in the time usually allotted to such subjects in the school program. It is well to carry with the course and experiments practical mathematical problems such as construction and capacity of cribs and silos; amount of rainfall; estimating quantity of seeds needed per acre for planting; judging corn; value of fertilizers needed for land; shrinking of corn in cribs; profit per acre on the different crops; return from one bushel of seeds, and many others that will suggest themselves to the teacher. (For problems in agricultural arithmetic write for extension bulletins published by Ohio State University Agricultural College, Columbus.)

There are the best of reasons why teachers, especially in the rural districts, should be interested in these agricultural problems as school exercises. First, the spread of the knowledge and practice of scientific agriculture has vast economical value in improving the products of American agriculture; second, the teaching of it in the rural schools exerts a strong influence toward interesting the parents in the permanent worth and importance of the school. The teacher who enters intellectually into the simple and practical exercises in agricultural nature study here suggested will not be long left in doubt as to the community's responsive interest in the school and its estimate of its social importance to the community. Children love to do things, especially things that are obviously useful; they need only judicial direction in order to turn their instincts into the various forms of self-education, which is the only kind of education that "sticks."

Special interest and profit result from

investigating the literature and different writings in which allusions are made to corn and wheat and relative subjects. Splendid use can be made of that part of Longfellow's *Huawakia* referring to Mondamin, with whom Hiawatha wrestled after the feast. To have a number of the pupils read a collection of such selections to the school and visitors Saturday afternoons makes a most interesting hour's exercise. Topics and practical tests can be made from the following outlines suited to the various grades. Perhaps the pupils of the first four or five grades may be too young to be taught the science of agriculture, but they are not too young to gain an abundance of knowledge along the line of nature study.

### Exercises on Soil.—How Soil Is Formed.

When the earth cooled it was composed of solid rock, upon which the water acted, changing or breaking it up into small particles. This was caused by the force of falling rain and hail and the expansion, by freezing, of the water in the small crevices of the rock.

Lichens then grew on the rocks and sand, obtaining their food from the air, and in their death and decay bacteria acted upon them, forming humus. Plants then grew on the sandy loam formed, and the roots, reaching down into the rocky crevices, split the rocks.

The soil and remaining rocks were then acted upon by oxidation, gravitation, wind, tides, animals, glaciers and earthquakes. All of these tended to break up and loosen the soil and prepare it for the action of water and carbonic acid, which dissolves the rock.

There are three distinct classes of soil—the alluvial, which has been brought from other places by streams; the sedimentary, which is the soil which was originally formed there; and the glacial, which was carried there by glaciers.

### I. To Show Retention of Water on Soil.

Materials.—Samples of clay, gravel, sand-loam, leaf mold; five glass bottles or fruit jars and five funnels.

Fill each funnel with a different kind of soil, same amount in each by weight. Tie a muslin cloth over the small end of each funnel to prevent the earth from washing through and place them over the jars. Pour an equal amount of water into each at the same time, note the soil that permits the water to pass through the fastest and the soil that retains the water the longest. Find how each soil ranks in its power to retain moisture. After two or three pourings weigh each funnel, and note the slight difference in weight; which soil retains the most water; which soil dries off the soonest after a heavy rain; which will be ready to plant first in spring; which soil will stand a very dry summer best.

### II. To Show Effect of Air on Soil.

Materials.—Two chalk boxes.

Fill one with loam, loosely packed. Fill the other box with clay or leaf mold, tightly packed. Plant the same kind of seed in each one and give both the same attention. In which does the plant seem to grow better?

### III. To Show the Advantage of Soil Foods or Fertilizers.

Materials.—Four chalk boxes or boxes slightly larger.

Fill each box with the same kind of soil. In No. 1 place a small quantity of stable fertilizer. In No. 2 a small quantity of high-grade commercial fertilizer. In No. 3 same quantity of cheap commercial fertilizer. In No. 4 omit fertilizer. Plant

same kind of seed in each box; cultivate all plants in each box by the same method. Notice the difference between the plants that receive the fertilizers and those that do not.

**Outline for the Further Study of Soil, With Test Questions and Sources.**—

- (a) Origin and tillage of soil.
- (b) Moisture and drainage of soil.
- (c) Fertilization and improvement of soil.
- (d) Adaptation to vegetation.
- (e) Effect of wind upon soil.
- (f) Study of properties of soil.
- (g) Renovation of worn-out soil.
- (h) Alkali lands.

**Questions.**—1. What is soil?

2. What is subsoil?
3. How is soil formed?
4. What is humus?
5. How does the earthworm influence soil?
6. Why should soil be plowed before corn is planted?
7. Why should crops be well cultivated?
8. Name three plants that improve soil. How?
9. What is meant by rotation of crops?
10. How are the following produced?

Sinking coasts, rising coasts, earthquakes, volcanoes, natural bridges, lakes, cataraacts, oxbow loops, deltas, glaciers, coral reefs, coal gas, oil, deserts, tundras, and estuaries. (See U. S. bulletin No. 257.)

**Sources and Summary of Bulletins Needed.**—U. S. farmers' bulletins Nos. 77, 245, 257, 262. (See list.)

**Exercises on Plants.**—It is assumed that the pupils who are to take up elementary agriculture have had some nature study work, and in this way have learned something of the structure of common plants—that is, they know the names and understand to some extent the functions of their essential parts: roots and stems, leaves and flowers, including the reproductive organs, stamens, pistils. When the pupils do not have such knowledge some time should be spent on these simple exercises in the study of plant anatomy.

**I. To Learn and to Find the Parts of the Flowers.**—Gather flowers that have all the parts, and with a sharp knife take each out and name. Cut a cross section of the cherry blossom and name the parts present.

**II. To Find Stamens and Pistils and to Compare Perfect and Imperfect Flowers.**—Perfect flowers have both stamens and pistils present. From a strawberry blossom point out these organs. Flowers having pistils only are imperfect flowers. Find such a blossom and compare it with a perfect flower. Will an imperfect flower produce fruit? What kind of a flower is found on Indian corn plant? Where are the stamens on the corn plant? The pistils?

**III. Roots and How They Get Their Food From the Soil.**—Materials—(1) A large mouthed bottle, a glass tube, an egg, some sealing wax and water. (2) Sawdust and a marble slab.

Plant food must be in liquid condition before it can be absorbed by the plant. The root structure of the plant is very intricate. There are little roots attached to the rootlets that are so small the naked eye cannot discern them. These are called root hairs and through them the plant receives its food. They are composed of a single cell filled with an albumi-

nous substance, called protoplasm, which is similar to the white of an egg.

As the covering of the cell is not porous in the ordinary sense of the word, the question arises as to how the liquid food enters the cell. This is accomplished by the principle of osmosis. It has been proved by scientists that if a dense liquid is separated from a less dense one by a thin membrane, they will flow together, the less dense fluid flowing into the more dense one in greater proportion than *vice versa*. This can be proved in the schoolroom with an egg, a glass tube, a large mouthed bottle, some water and some sealing wax.

The glass tube is inserted into the small end of the egg and sealed in place with the sealing wax. The shell of the large end of the egg is then broken off to expose the membrane, and the large end put into the water. The water and the white of the egg will, in the course of a few hours, flow up the tube.

After the liquid enters the root hair cell, it is carried up to the plant by means of capillary attraction, which is a power which tends to raise the water.

The root hairs of a root system can collect nourishment from the undissolved plant food by tending to dissolve it with an acid secreted in the membrane of the root hair. To prove this, cover a polished piece of marble with wet sawdust and plant a few seeds in it. The root hairs will sprout, and, when removed, the marble will be rough.

**IV. To Show That Plants Give Off Moisture and the Rise of Water in Plants.**—Materials—Crock or pot of earth containing a plant, a piece of cardboard, glass tumbler, and a piece of wax or tallow.

Figure to show that plants give off part of the moisture absorbed from the soil

Take a plant that is well started. Cut a slit in the cardboard and draw it around the plant. Seal the slit with wax or tallow so that no moisture can come up through it from below; cover the plant with the glass and set in a warm, sunny place. Moisture will condense on the inner surface of the glass. Where did the moisture come from? Does this experiment prove that water rises in plants?

**Why?** Cut a stalk of green corn or the stem of a geranium three or four inches above the ground. Observe the moisture that gathers on the point where the stalk was cut. Where did this moisture come from?

**V. To Show Root Development on Cuttings.**—Materials—Branches ten to twelve inches long taken from a willow tree; a glass jar.

Place these cuttings in a glass jar partly filled with water. Place the jar in a warm place and in about twenty or thirty days you will observe the roots formed on many different parts, especially house pot flowers.

**VI. To Prepare Soft Cuttings.**—Soft cuttings are sometimes made from leaves, but often from the stem. Insert the edge or a piece of a leaf in moist, warm sand; or lay the leaf, top side up, on the surface of the sand and fasten it down by running splinters through the veins in different places. Plants may spring up from the edges or at cut places in the leaf. In case of stem cutting secure thirty shoots from any strong herbaceous plant, such as the verbenas or geranium, and divide them into cuttings of at least two nodes and several leaves. Break off a part of some of the leaves to check evaporation. Pack the sand firmly around the cuttings and they will soon take root.

Figure showing parts and contents of grain of corn

**VII. To Learn to Test Seed Corn and Garden Seeds for Their Vitality.**—Prepare a germinating box about 10x12 inches and 3x5 inches in depth. Fill this box about half full of earth or sawdust. Moisten the earth and place over it a cloth of the same size as the box, first marking the cloth off in squares (checkerboard) of equal size, numbering each square. If there are 25 or 30 squares or sections on the ruled cloth, take as many seed ears as there are sections, numbering each ear to correspond with a section. Take from different parts of the ear, say eight grains. Place these eight grains in the section that corresponds with the number of the ear. After the grains have been properly placed in each section of the cloth, spread a second strip of cloth over the box so as to rest flat on the grains of corn. On the top of this cloth place moist soil in a sack. Observe the corn from day to day so as to examine the root hairs as well as the sprouts that come on the

fertile grains. Find the per cent in each section that were fertile. Any ear making 85 or 90 per cent is good enough for seed. Those falling below 60 or 70 per cent should be discarded. This box should be kept in a place having about the same temperature as would naturally be the case out of doors in corn planting season. (See bulletin 409.)

5. What are tubercles? Legumes?
6. What legumes are used for food?
7. Why will corn usually grow well when planted in a clover sod?
8. After learning the food elements needed by each crop, indicate a good system of crop rotation for your vicinity.
9. What purpose do the root hairs serve the plant?

on the other. What caused the decay to appear? Why did the picked apple show no signs of decay? Why will a barrel of apples soon spoil if a few bad ones are in it?

**Outline for the Further Study of Fruit and How to Raise Fruit Trees and Test Questions and Sources.**—

- (a) Kinds of fruit.
- (b) Best soil for fruit trees.
- (c) Planting of fruit trees.

Seed-Testing Boxes

**VIII. To Learn How to Gather, Select and Care for Seed Corn.**—Have each pupil describe the method of selecting corn that is practiced by his father and neighbors. How do the methods mentioned in bulletin No. 299 compare with those practiced in your community? (See farmers' bulletins 299, 119.)

**IX. To Show Corn Mixing or Crossing.**—Materials.—White corn and yellow corn. Plant a small plot of white corn near a small plot of yellow corn. At husking time observe the kernels. How does corn mix? Explain in full. Plant a plot of sweet corn near some popcorn. Did it mix? Will it pop well? How are new varieties of corn or other plants started?

**X. To Learn What Seeds Are Scattered by the Wind.**—Have pupils collect and examine such seeds as those produced by the maple, box elder, elm, ash, dandelion, milkweed, thistle, parsnip, etc. Learn to recognize them wherever found.

**XI. To Learn What Seeds Are Scattered by Animals.**—Have pupils collect seeds or fruits from the Spanish needle plant, the burdock, sandburs, beggar lice, etc. What animals of the field scatter many of these weed seeds? How? Learn to recognize these seeds. In what other way are weed seeds scattered over the land?

**Outline for the Further Study of Plants With Test Questions and Sources.**—

- (a) How plants feed—from soil—air.
- (b) Root tubercles.
- (c) Kinds of roots.
- (d) Use of roots for food—for medicine.
- (e) Other uses of roots.
- (f) Pollination.
- (g) Crosses, hybrids—pollination.
- (h) Propagation.
- (i) Selecting good seeds.
- (j) Crop rotation.
- (k) Composition of plants.
- (l) Effect on climate.
- (m) Rank compared with other countries.
- (n) Poisonous plants.

**Questions.**—1. Explain how plants get food from the air—from the soil.

2. Why can an alfalfa plant stand more drought than clover?

3. Define tap, fibrous and fleshy, as applied to roots.

4. Define oemosis and give some of its uses in the plant kingdom.

10. What causes a tree to thicken about a wire that may be tied around it?
11. What is meant by pollination?
12. Would it be profitable for a fruit man to keep bees? Why?
13. What is cross pollination?
14. What is plant propagation?
15. What is the best method of selecting good seed corn? (Farmers' bulletin 199, 229.)
16. Learn to name and recognize about fifty weeds that grow in your neighborhood. (Farmers' bulletin No. 28.)
17. Explain the terms, annual, biennial, and perennial as applied to plants.
18. What is meant by purity and vitality as applied to seeds?
19. What are seed germinators?
20. Name twenty poisonous plants.

**Sources and Summary of Bulletins Needed.**—U. S. farmers' bulletins 339, 278, 188, 212, 240, 157, 199, 299, 28, 111, and 86. (In list.)

**Exercise on Fruit and How to Raise Fruit Trees.**—1. To Propagate by Tip Layering.—Materials.—A branch of black raspberry. The tip of a branch of black raspberry is bent over to the ground and covered with earth. It will soon take root and form a new plant. Pupils should try this several times and see how many new plants can be started from one old plant. (See U. S. bulletin No. 157.)

**II. To Propagate by Vine Layering.**—Materials.—A long branch of a grapevine. Bend it down flat on the ground and place it in a small trench in the ground. Cover it entirely over, and roots will put out at intervals and branches will come up through the ground. You can afterward cut the old vine between each new shoot and thus have several new plants. (See U. S. bulletin No. 157.)

**III. To Learn to Do Practical Grafting and Budding.**—(See farmers' bulletin No. 157.)

**IV. To Show Why Apples to Be Kept Over Winter Should Be Picked.**—Materials.—Three apples.

Take one that has fallen from the tree and received sufficient injury to break the skin, or break the skin with a stick. Secure another that is slightly bruised and one that is absolutely sound that has been picked. Put the apples away and note what takes place on the bruised part of the one, and where the skin was broken

(d) Care of fruit trees.

(e) Grafting.

(f) Budding.

(g) Pruning.

(h) Layering.

(i) Canning of fruit.

**Questions.**—1. What is the first step in tree planting?

2. Will the tree coming from the seed be like its parent?

3. What is grafting? Its purpose?

4. What is the scion? The stock?

5. When is the best time to make a graft?

6. Who was Luther Burbank? Learn all you can about this man.

7. Name several varieties of peach, pear, plum and apple trees.

8. What kind of each is usually planted in your community?

9. What fruits are usually raised by budding?

10. Explain the process of budding.

11. When can trees be budded or grafted upon one another?

12. How should a young tree be set in reference to the prevailing wind?

13. What are the principal objects of pruning a fruit tree?

14. When is the best time to prune to favor wood production? To induce fruitage?

15. Give a simple method of treating the stumps when large limbs have been removed by pruning.

16. Will a tree bear both wild and budded or grafted fruit at the same time?

17. What kind of soil is best for fruit?

18. How can a fruit tree be kept from making too rank a growth to produce good fruit?

19. Should orchards be pastured? Why?

20. Should fruit trees be cultivated?

21. Why will properly canned fruit not spoil?

22. What fruit is usually canned in tin? In glass?

23. Name ten varieties of apples and tell in what month they ripen.

**Sources and Summary of Bulletins Needed.**—U. S. farmers' bulletins 203, 198, 161, 154, 134, 113, 181 and 157. (See list.)

**Study of Plant Diseases and Their Prevention.**—Outline, Test Questions and Sources.

- (a) Cause and prevention.
- (b) Fruit molds.

- (c) Peach curl.
- (d) Club root.
- (e) Potato scab and blight.
- (f) Pear and apple fire blight
- (g) Smut of wheat and oats.

(h) Black knot.

**Sources and Summary of Bulletins Needed.**—U. S. bulletins Nos. 153, 250, 80, 127, 132, 16 and 259. (See list.)

**Farmer's Bulletins.**—The following is a list of valuable bulletins on practical subjects that should be a part of every rural school and farmer's library. These are alphabetically arranged for handy reference, and will be sent free to any address in the United States on application to any senator, representative or delegate in Congress or the Secretary of Agriculture, Washington D. C. Besides the U. S. bulletins here indicated, each state issues free bulletins on special methods, care and culture of crops peculiar to that state. To secure these, address the state secretary of agriculture at the capital city, or the state agricultural college. In writing for these state bulletins the writer should indicate the particular subject in which he is interested.

- No. 339. Alfalfa.
- No. 194. Alfalfa Seed.
- No. 263. Apple Diseases and Codling Moth in the Orchard.
- No. 61. Asparagus Culture.
- No. 18. Bean, The Soy, as a Forage Crop.
- No. 69. Bee Keeping.
- No. 62. Beet, The Sugar.
- No. 209. Boll Weevil in Cotton Seed and in Ginseng.
- No. 112. Bread and Bread Making.
- No. 241. Butter Making on the Farm.

- No. 131. Butter, Household Tests for Detection of Oleomargarine and Renovated
- No. 106. Cattle, Breeds of Dairy
- No. 152. Cattle, Scabies of
- No. 167. Cassava.
- No. 235. Concrete, Preparation of Cement
- No. 174. Corn, Broom
- No. 233. Corn, Germination of Seed
- No. 303. Corn Harvesting Machinery.
- No. 313. Corn, Harvesting and Storing.
- No. 220. Corn, The Production of Good Seed
- No. 290. Cotton Bollworm, The
- No. 201. Cream Separators on Western Farms.

- No. 250. Wheat Smut and Loose Smut of Oats, The Prevention of

## SECONDARY EDUCATION

### A VIEW OF THE WORK OF HIGH SCHOOLS, ACADEMIES AND PREPARATORY SCHOOLS

**SECONDARY SCHOOLS.**—The secondary school system of the United States has developed out of the peculiar conditions of American life. It occupies a middle position between the elementary schools on one side and the colleges and higher technical schools on the other. The great majority of secondary schools are public institutions, supported by general taxation. A smaller number are private or endowed schools dependent upon tuition and upon private donations.

In each state the public school system, including the high schools, and in some cases, the state university, is under the control of state law. Our whole system of education is therefore a group of state systems, somewhat widely variant from one another yet containing some of the unifying elements of a general national system. According to the report of the national commissioner of education for 1908-9, 1,034,827 students were scheduled as attending secondary schools. Of this number 863,026 were in public high schools, and 171,801 in private secondary schools. During the nineteen years from 1889-90 to 1908-9, the number of secondary students in public high schools increased from 221,522 to 863,026, while the number of students in private secondary schools increased only from 145,481 to 171,801. Indeed the number of students in private secondary schools has fallen off several thousand in the last four years. During

the last twenty years there has been a corresponding improvement in the buildings and equipment of public high schools.

The following is the summary of the report of the commissioner of education for 1908-9 for the United States:

LIBRARIES		GROUNDS AND BUILDINGS		SCIENTIFIC APPARATUS	
Number of schools reporting	Volumes	Number of schools reporting	Value	Number of schools reporting	Value
8,676	5,143,121	8,671	\$223,847,479	7,117	\$13,777,153
MONEY VALUE OF ENDOWMENT			EXPENDITURE FOR SITES, BUILDINGS AND IMPROVEMENTS		
Number of schools reporting	Value	Number of schools reporting	Value	Number of schools reporting	Value

While this latest report is incomplete because some schools failed to report, it is quite sufficient to show that the American people have made a large financial investment in the public secondary schools. It is within the last twenty years that the remarkable expansion of the public secondary schools has taken place. The commissioner of education remarks further in his latest report "The rate of increase in the number of secondary students from

year to year is greater than the rate of increase in population. In 1890 the number of secondary students was 367,003, or about 5,900 to the million of population. In 1900 it was 9,500 to the million of population, and in 1909 about 11,700 to the million, or over 1 per cent of the population."

A historical examination of the schools of the United States would demonstrate that the public secondary school system, as we now have it, has sprung directly from the will and purpose of the common people. The free public high school is now generally recognized as a strong and important expression of American democ-

cracy. It is designed to offer to all children in the United States the full opportunity for higher education. In this respect it differs from other great secondary school systems in Europe.

The free secondary school is just beginning to take on its full importance and next to the elementary school is the most fundamental of American institutions. After the Revolution and until about 1850 the private and endowed academies

were the chief places for secondary schooling in the United States. But since 1850 the free public high school has developed rapidly in importance, till now it largely predominates. The first free secondary schools were established in Boston, Philadelphia, Baltimore and other eastern cities. Massachusetts and New York early established, by state law, systems of secondary schools under state control. Later, western states like Indiana, Minnesota, Michigan, and Wisconsin founded systems of secondary schools, with state universities to complete the comprehensive plan of state education. Such free high schools have been organized under local boards and are supported mainly by local taxation, but in the state systems the school funds of the whole state have been sometimes drawn upon for support of such schools. The free public high schools have had a stronger development in the middle west and in the far western states than in the east. But in recent years large public high schools have been founded in New York City and in other eastern cities where previously private secondary schools prevailed. In the eastern and southern states the private and endowed secondary schools still hold a relatively important place, but in recent years the public high school has developed with such rapid strides that it now leads in affairs of secondary education in all parts of the country.

Originally the high schools were not designed as fitting schools for colleges, but, somewhat in contrast to private schools preparing for college, the high school was to extend and expand the elementary school course for the benefit of the common people. The old private and endowed preparatory schools were somewhat aristocratic, while the high school is strictly a school of the people, and in more recent times it has been frequently called the people's college.

The tendency in the Mississippi valley states and farther west to establish state universities, sustained at public expense, as the completion of a free public school system for the people, made it necessary to establish a close connection between the high schools and the universities. Most of the middle and western states now have a state school system consisting of three closely related parts, the common school, the high school, and the university. All the states are now following more or less closely upon this plan. It was natural also that great public high schools should find it necessary to put themselves into close relation to the colleges and universities, because large numbers of high-school graduates would surely desire to go to college. Our present high schools are the result of a variety of historical forces. They are in the main locally controlled and supported, and stand very close to the common people. In many of the states the legislatures by state law have organized them into state systems. The state universities, also founded and controlled by the states, stand in close organic relation to the high schools. The secondary schools of the United States display wide variations and much lack of uniformity. The national government exercises no direct control over them, not even to the extent of requiring statistical returns. And yet the secondary schools are rapidly growing into uniformity. In spite of very important differences between the north and the south, between the extreme east and west, common in-

ences are at work throughout the whole country which are fixing common standards. Such are the state and national teachers' associations, organizations of secondary teachers and of college teachers, the reports of the national commissioner of education, the appointment of important committees from institutions in all parts of the country to report upon college entrance requirements, courses of study, the elective system, vocational training, and other special topics. Educational journals and literature tend also to propagate and unify important ideas in secondary education.

The ideal of the high school system is to put within reach of every child secondary training whether he lives in the city or country. High schools vary therefore in size and equipment from a rural school with not more than a dozen children to

a city school of four or five thousand students with corresponding equipment.

Our main purpose will be to describe somewhat fully the various courses of study offered in these schools, to outline briefly the content of the various branches to explain their value for purposes of general culture, and to point out their practical utilities when applied to actual life.

An examination of the course of study in one of our large city high schools shows that it consists of a group of courses serving several different ends. Some large city high schools have as many as twelve separate courses, e. g., the city of Los Angeles. The Hughes high school of Cincinnati has eight distinct courses, four of which are preparatory for colleges and professional schools, and four courses technical and industrial, and leading to vocations.

#### TYPICAL COURSES AS EXHIBITED BY THE CINCINNATI HIGH SCHOOL

**FIRST GROUP**—Academic courses for general culture and leading to colleges and professional schools.  
**SECOND GROUP**—Technical and industrial, and leading to vocations.

**ACADEMIC COURSES**—Elocution 1, Music 1, Gymnasium 2 periods a week, throughout the four years.

Such a program as this is clear proof that our high schools have expanded their curriculums in recent years to take in all the important academic studies and also a good typical representation of the technical and industrial arts. The high schools have shared fully in that expansion of studies which has marked the recent development of all schools from the primary to the university.

**The Course of Study** in secondary schools has been extensively discussed in recent years by leading educators. Important and far-reaching changes have been made. Instead of one course we have many.

We desire to know the value of different studies and courses for culture, for discipline and for the uses of life. First of all is the great series of humanistic studies, including ancient and modern languages, grammar and rhetoric, literature and history. This group of studies has furnished the main constituent for secondary courses for the last four centuries. It deals primarily with human life as expressed in language and literature.

**Language** has long been regarded as the most fundamental of studies because it is the medium of thought in all education and because in it are preserved the past experiences of the race. Man distin-

guishes himself from animals by his powers of speech. Language involves the logic of clear thinking. It has long been supposed to bring a very superior kind of mental discipline.

**The Ancient Languages**, in particular the Latin and Greek, because of their complete inflections and conjugations, and the fine shades of meaning they can accurately express, were held far superior to modern tongues. The classic literary style of the ancients, as exhibited in the masterpieces of Greek and Latin literature, has been esteemed by scholars much superior to the style of the moderns. From the aesthetic or artistic point of view, therefore, the ancients have long held the moderns in bondage. Great poets and orators in modern times have been confessed imitators of the ancients.

At the time of the revival of learning in Europe, nearly all the books and libraries in common use were printed in Latin, and all scholars spoke and wrote Latin. As a consequence, for three hundred years Latin held the supreme position among school studies. But with the rise of modern languages and literatures, with the appearance of such modern masters as Milton and Shakespeare, Schiller and Goethe, Racine and Molière, the ancient

tongues began to lose their supreme place. It was not, however, till the latter part of the nineteenth century that modern studies, such as the natural sciences, history, modern languages and mathematics, began to assume an equal place with Latin and Greek in secondary courses of study. This great change has been working itself out in European countries as well as in America, although more slowly and more conservatively.

The great masterpieces of Latin and Greek literature have all been translated into superior English by some of our best writers and poets. It is now claimed that a student can get a better understanding of the content and spirit of Latin and Greek masters during the school period by reading these translations than by the laborious study of the originals. The average student has not time to master the Latin language so as to read Latin authors in the original, much less the Greek. In consequence Greek has almost disappeared from our high-school courses during the last thirty years. The old notion of discipline through the drill in Latin and Greek has lost much of its force in recent years, because it is held that modern studies which are of greater practical service are equally valuable as discipline.

On the other hand Latin is likely to retain its present place and importance in secondary education, because it is a sort of mother tongue to all the western European languages, and serves as a linguistic basis for all study of English, French, German, etc. All of our modern languages are full of Latin. Our literature is permeated with Latin words, thought and spirit.

**Latin.**—The high-school course of study in Latin usually includes some of the chief writings of Caesar, Cicero and Vergil. The first year is chiefly preparatory to the study of Latin authors. A series of exercises is provided in the inflections and conjugations of Latin words, with the memorizing of Latin vocabularies and the composing of Latin sentences.

The first book of Caesar's *Commentaries on the Gallic Wars* is sometimes read during the first year. Three or four books of Caesar are translated into English, with a constant drill upon the rules of Latin construction.

The third year is usually given to the study and translation of Cicero's *Orations*, especially the four against Catiline, and three or four others. These are the greatest orations in the Latin language, and have been the models for the great orators of modern times.

The fourth year is usually devoted to the study of Vergil's *Aeneid*, the great epic poem of the Latin tongue. From three to six books are read. Other Latin authors are sometimes substituted for the above mentioned, as Eutropius, Sallust, and Livy.

Parallel with the study of Latin writers it is customary to give a course in the history of Rome, to present a fuller biography of the great authors, and to bring out the historical background of their writings.

The Latin course is continued for two or more years in college, for those who wish to specialize in Latin studies. Other great Latin masterpieces are read, as Cicero's essays on friendship and old age (*De Amicitia* and *De Senectute*), the historical works of Livy and Tacitus, the

comic plays of Terence and Plautus, the poems and odes of Horace, and the works of Seneca, Juvenal and Quintilian. This series of great Latin masters is not very long, but it is upon them chiefly that the fame of the Latin tongue rests.

One of the chief difficulties in the learning of Latin is that there is no easy introductory Latin author suitable for boys and girls. Caesar's *Gallic Wars* are usually read first, but this is a difficult book for beginners. Various attempts have been made to overcome this difficulty, e. g., by using Æsop's *Fables* in Latin. Other stories have also been written in Latin for the benefit of children. The fact is that none of the great Latin writers ever thought of writing stories for children. They are all for adults.

Excellent translations of all the great Latin writers are now easily obtainable in our libraries, so that English students not versed in Latin may easily make the acquaintance of their works.

**Greek.**—The study of Greek embraces a similar course in the masterpieces of Greek literature. The high-school course in Greek, formerly required for admission to college, but now pursued by only a few students, consisted of preparatory studies in inflections and grammar, and about two years' work in translating the first books of Xenophon's *Anabasis* (the march of the ten thousand Greeks into Asia), and Homer's *Iliad* (the first four or six books or the *Odyssey*).

This high-school course was followed up in college by the reading of Demosthenes and Lycurgus' orations, the histories of Herodotus and Thucydides, the dramatic works of Æschylus, Sophocles and Euripides and the philosophical writings of Plato and Aristotle.

The literature of the Greeks, as revealed in these works, is generally regarded as superior in quality and artistic form to that of the Romans.

**The Modern Languages**, especially German and French, have become established in our high schools as standard linguistic studies on a par with Latin. The colleges also accept them as full equivalent for admission. The question may be fairly entertained whether it would not be better to begin foreign languages with German in the grammar school and follow later with Latin.

The reason for this rapidly growing prominence of the modern languages is not difficult to explain. They are, first of all, great literatures, enriched with the masterpieces of preeminent philosophers, poets and artists. In richness and variety of content these modern languages far surpass the classical tongues of antiquity. In fiction or novel writing and scientific treatises we have extensive fields of literature for which the ancients have no equivalent. Another advantage of the modern tongues is that they are much more easily and quickly mastered than Latin or Greek. After a year's study of German the student may enter completely into the spirit and meaning of the great German masters, while it requires several years of laborious study to reach the same result in Latin. This is no small advantage, considering the wide range of studies involved in a modern liberal education.

German is also an inflected language and brings to the English student a grammatical training similar to that of the Latin.

The severe mental discipline attributed

to Latin may be counterbalanced by the increased interest and literary enjoyment derived from the study of German masterpieces. The higher cultural value of the modern tongues is far more accessible to the student than the old culture.

On the other hand the practical value of German or French for purposes of conversation, for travel, for business, and for immediate use in literary and scientific studies is great. This readily available utility of modern languages gives motive and impetus to study. The scholar in almost any field of research, the diplomatist, the merchant, and the teacher find ready use for German. We meet the German everywhere, in business, in science, in education. He, with his language, is one of the drive wheels of modern civilization.

French, formerly studied more than German, has been somewhat superseded by German in America. Yet the French language, like the German, is of next kin to English, and has the same advantages for us as German, a great modern literature, easily accessible, and wonderfully rich in cultural value.

The broadening effect of a modern tongue, the enlargement of the field of vision, and the wider sympathies for a different race are some of the chief advantages in modern language study.

**English.**—The study of English has risen into great importance for high schools in the last twenty years. As our respect for ancient literature has dwindled, our appreciation for our mother tongue has increased. Vigorous and continuous efforts have been made of late years in high schools and colleges to put the instruction in English upon a stronger basis. There is a good reason for making the study of English more important and thorough than perhaps anything else. First of all, good choice English is necessary in all studies and throughout life. It is the most practical of all studies both for the ends of good scholarship and for strong citizenship and business success.

**English Literature**, in the richness and variety of its culture materials, is the first of all great studies with which to expand and fortify the mind. The average student, too, has a chance to get at the master minds of English thought directly, without laborious years of study as in Latin. Scott, Byron, Carlyle, Tennyson, Webster, and Emerson may speak directly to all without tedious delay. No other thought material thus available to high-school students is so thought-provoking and so strong in its educative effects as are the great essays, orations, poems and histories. It is stimulating in a high degree, if we can only find the material suitable to each mind. Literature is also so many-sided and varied that it will adapt itself to the most diverse dispositions.

**Composition.**—The study of English from the standpoint of composition and rhetoric is more formal and perhaps more tedious, but of great importance as a training in thought organization, in simplicity, force and accuracy of expression. Each person must learn to use English in his own way, and to develop some originality and individual force. But the imitation of good models, criticism of faulty style, drill in outlining, paragraphing and correcting grammatical form are indispensable. Even spelling and punctuation, correct forms in letter writing and composition, are not useless but of direct practical value. In recent years we have had many

excellent teachers of English composition in high schools.

**Rhetoric** is a discussion and study of the essentials of style as it appears in good authors. It brings out and illustrates the various forms of discourse and the peculiarities of each, the figures of speech and their force, the value as seen in the best writers. The working out and discussion of themes, short stories, and plans of organization are treated. The student of English will find in Benjamin Franklin's *Autobiography* an interesting account of how he trained and exercised himself with his companions of the Junta in acquiring an acceptable style in writing and speaking English.

The practical value of these various branches of English study is so universally recognized that they have come to be required from all students in the various high-school courses. In scientific and business courses, no less than in the old classical and language courses, a complete training in good English is now laid down as one of the few fundamental demands made of all students alike. Its utility in the daily affairs of life is not less significant than its cultural value in broadening and elevating the mind to the level of great thoughts.

English as scheduled in high-school courses is probably the most important study of all. The Committee of Ten allowed this study five hours a week for four years, more time than is granted any other study. High-school catalogues show that this advice has been followed in many schools.

The English course as outlined in one of our average high schools is as follows: The work in English is designed to give the ability to use good English and the power to appreciate good literature, and covers the following points: Drill on the technique, spelling, punctuation, grammar, etc.; practice in the speaking and writing of simple, accurate English, with some training in declamation and debate; the study and discussion of some masterpieces of English literature, with the aim of creating a taste for such reading. The books chosen provide for the study of a masterpiece in each of the forms of literary expression—the novel, the epic, the drama, the essay, etc. An outline of the work is given herewith.

English is given in the first, second, third, and fourth years. In the first and third years, two-fifths of the time is given to composition. There is also outside reading and word study in declamation. In the third year a grammar review is given, using Scott & Buck's *Grammar* as a text. In the fourth year the history of English literature is studied, besides a number of classics, while one recitation a week is given to composition. In the second year there is a drill course in business English. This course is given five times a week for one semester and is an elective course. The work covers letter and theme writing, grammar, punctuation, and the reading of some classics. In each year except the second, six classics are studied thoroughly. In the first and third years eight books from a supplementary reading list are read at home and reported on. In the senior year there is a large amount of library reference work based on any good work on English literature. Also one long essay, over 1,800 words in length, upon an approved subject, is required of all senior students.

**History** as a study has been developing into a greater importance as a high-school branch. It includes American history, European and ancient history. History as now taught and studied is far more valuable than formerly. As a mere enumeration of facts and dates, of court intrigues and wars, history was unprofitable. History is now an effort to grasp great race movements, the development of important institutions, the life history and purposes of influential characters, and the customs, character, and industries of the people as distinguished by princes, rulers, etc. History thus becomes far more interesting and illuminating. We sympathize with the hardships and struggles of past ages and understand at that cost our present comforts and protection are secured. On the one side history has become more biographical, dealing with great representative leaders more fully and dramatically. On the other side it is becoming more social, more democratic, devoted to the interests and welfare of the common people. We may all learn the greatest lessons from history.

By reason of the improvement in methods of teaching, history has become a very interesting and profitable study. Biography lends its charm by detailing the lives of remarkable men and women. In the high schools, as well as in the elementary schools, great biographies are the life of instruction. They are concrete and stimulating to youth. The lives of William Penn, Winthrop, Raleigh, Columbus, Samuel Adams, Paul Jones, Hamilton, Jefferson, Whitney, Morse, Horace Greeley, and others bring the student into the real life and conflict of past periods of history. In Europe, Chatham, Burke, Pitt, Peel, Silvert, Richelieu, Luther, Cromwell, Frederick the Great, Gustavus Adolphus, Bismarck, and Gladstone suggest stirring scenes and great epochs of national life.

A proper treatment of history also reveals the beginnings and progressive development of state and church, of self-governing democracy, of westward expansion over states and territories, of the growth of cities, etc. Important ideas develop through long periods of history. The wonderful scientific inventions of recent years have changed the whole face of society and have caused a vast accumulation of wealth and comfort. At the same time social evils have been multiplied. History has become a broad social study. Public sentiment as developed by the press and educational agencies has become a powerful force in society, and the history of the changes by which these results have been secured is an eye-opener to the great problems of our time.

History thus is the real and effective mode of teaching civics, of training for citizenship, or intelligent cooperation in politics and social reform. The best way to get at our present problems is to trace them up in their origin and growth. Economics is not much taught in our high schools, but in connection with history the more important phases of economic development come out in concrete setting.

History is an important moral force. It teaches by example. It shows good and bad characters objectively in the panorama of national life. We always judge men and women in history from the viewpoint of high standards. Personalities impress us as benefactors of the race or as evil-doers, tyrants and enemies of social good. History well studied

gives a peculiarly valuable discipline in the power to judge and weigh social and economic problems. It requires a balanced capacity for mental deliberation, for weighing probabilities, for a fair-minded and unprejudiced estimation of forces. It is a very different kind of reasoning from that of mathematics, and is far more practical for the ordinary uses of life, of politics, etc. Our textbooks in history, because of their condensed character and epitomizing tendency, are not so lively and interesting as the larger, fuller histories. The student is often to fully enjoy and appreciate history should read at his leisure such books as John Fiske's *Critical Period of American History* and his other volumes of American history, Parkman's *Old Regime in North America*, D'Aubigne's *History of the Reformation*, Motley's *Dutch Republic*, and Carlyle's *French Revolution*. Such books throw a brilliant light upon important epochs in the life of nations.

Upon high-school students more than upon any other class of people rest later the responsibilities for leadership in political and social reforms, that is, for solving the large problems of democratic society. Historical and literary studies expand and liberalize the mind in such social studies.

**Science.**—The second important group of secondary studies is that of the sciences. Such are botany, zoology, physics, chemistry, physiology, geology, and astronomy. They have grown into large importance in recent years. We have now courses in the high school which are predominantly scientific, and some phase of natural science is required in nearly all curriculums. Fifty years ago the natural sciences had an insignificant place in secondary education. To-day they share the field of education with other great studies on equal terms.

Modern science has revolutionized life outside of the school, and it has gone a long way toward revolutionizing courses of study and methods of teaching in the schools. The first question that naturally arises is, What is the cultural and disciplinary value of the sciences? and second, What is their bearing on the utilities of practical life? We may touch on the answers to these questions as we deal with the separate sciences.

**Biological Sciences** as taught in high schools includes botany, zoology, and physiology. Botany deals with the structure, life development, and classification of plants. It comprises the vast variety and profusion of vegetable growths which cover the surface of the earth in all zones and climates. Zoology performs a like service for the countless forms of animals on land and sea, in the air and soil.

It has been a favorite idea of nature-study enthusiasts that the study of plants and animals sharpens the observing powers, trains the senses to acute perception, and provides the natural and fundamental inductive thought movement. Comparison of specimens, classification, and the discovery of natural laws follow the strictly inductive plan. Certain it is that great scientists have found the freest development of their thinking powers in pursuing these lines of investigation. Darwin and his associates, working upon this plan, developed the doctrine of evolution, which in the last sixty years has wrought a marked change in all branches of study. The doctrine of evolution, developed in purely biological studies, has been applied to human life and history, to sociology,

to politics and religion. After such great achievements the biological sciences have gained recognition as liberalizing studies on a par with history and literature.

Zoology is studied in high schools, sometimes a half year, sometimes a full year, five hours a week. A series of laboratory studies of typical animals is worked out with dissections and use of the microscope. Sufficient comparisons are made with other species to work out important classes. The following series illustrates the plan:

The common locust.  
Butterflies and moths. Other insects.  
Spiders and their allies.  
The crayfish. The clam.  
The earthworm. Vermes.  
The fresh-water sponge.  
The amoeba. Protozoa.  
The yellow perch. Other fishes.  
The common frog. Amphibia. Reptiles.  
The pigeon. Other birds.  
The squirrel. Mammals.

Each animal is studied in its native environment, in its adjustment to life conditions, and in its structure. The evolution of animal life in successive forms is traced out, and the laws of development unfolded.

Biology has also been making contributions to the useful arts and to human needs in many ways. In agriculture and gardening, in fruit growing, in the domestication of fruits and animals, in forestry, in bacteriology with relation to disease, in medicine as related to physiology and hygiene, in the great transforming industries of food production, and even in the physiological basis of psychology, biology has made the greatest contributions. Without a knowledge of biological laws as developed in recent years one cannot appreciate discussion about pure foods, about conservation of resources, about tuberculosis and other diseases, about health and dieting, about sanitation at Panama, and about the most important present-day topics in politics, education, and social progress.

**Physiology** in high schools usually requires a half year. It includes the general structure and relation of bodily organs; the vital organs and their processes and mutual relations; topics in applied physiology, such as health and sanitation; use of narcotics and alcohol; food and dietetics, first cause in accidents.

**Physical Sciences** (physics, chemistry, geology, and astronomy) constitutes the second great field of science which is studied in high schools. It deals with physical force as manifested in gravitation, in light, heat and electricity, and in chemical affinities. Physics and chemistry have become the important physical sciences for high schools and colleges. Geology and astronomy are usually reserved for colleges.

**Physics** is usually studied a full year in the third or fourth year of the high school.

There is a tendency to begin with machines and processes in the industries, rather than with purely theoretical work. Physical laws are illustrated by such machines and practical applications. Some of the leading topics are as follows: The conservation of energy; the indestructibility of matter; heat, light, and electricity and their laws; sound and mechanics; the steam engine; the microscope; wireless telegraphy; the dynamo; the electric light; the telephone; the gas engine. Careful notebooks of laboratory work are usually kept.

In the report of the Committee of Ten is offered a series of fifty experiments in laboratory physics.

**Chemistry** also requires usually a full year's study. Sometimes the chemistry precedes physics. Some of the important topics are as follows: The atomic theory; the important elements, as oxygen, nitrogen, hydrogen, carbon, sulphur, etc., and their reactions; the metals, and their preparation; organic chemistry; the application of chemistry to the industries is made prominent.

The report of the Committee of Ten furnishes a series of 100 experiments in chemistry for secondary schools.

Many of the strongest scientific minds of the last four centuries have devoted themselves to the investigation of physical and chemical problems. Galileo, Newton, Laplace, Franklin, Tyndall, Faraday, Lord Kelvin, and Helmholtz are examples. The body of scientific knowledge that has accumulated is of vast importance to the world, both as a basis for the liberal interpretation of nature and for its utilities to man. The physical sciences illustrate at their best the modern scientific method of investigation, of laboratory experiment, of reasoning by hypothesis and verification. The mental discipline gained by the study of physical science is one of the strong elements of liberal culture.

From the practical, utilitarian point of view, the increase of man's power over nature through the study of physics and chemistry opens one of the important chapters in human history. The microscope and the telescope have disclosed new worlds. Steam and electricity have produced such profound changes in human life that they are almost beyond our capacity to estimate. Commerce, manufactures, and mining are developed and controlled largely by physicists and chemists.

Schools of technology at the universities and elsewhere cultivate especially the physical sciences. The departments of engineering are equipping experts for all the important technical processes in the industries, as in railroading, in smelting and reducing ores, in ship construction and architecture, in navigation, in photography, in electrical machinery, in printing and dyeing, in steel production, in sugar refining, in electroplating, etc. The important inventions and machines of our age are applications of physical principles, as the power loom, the turbine wheel, the linotype, the stereoscope, the electric motor. These important applications of physical science have become so universal that every person of general intelligence needs to have an acquaintance with them.

**Mathematics**, especially geometry and algebra, stand in very close relation to the physical sciences. These branches of mathematics have been recognized as a very important part of the high-school course, both for their general disciplinary value and because of their fundamental relation to physics, astronomy, and scientific knowledge generally. Geometry in dealing with special dimensions works out a series of closely dependent propositions in strict logical sequence. It demands close logical thinking and demonstration. Algebra develops a more abstract kind of thinking. Many of the more difficult problems of arithmetic can be solved easily by algebraic formulas, and should be postponed to later study in the high school. Algebra and geometry pave the way for physics and chemistry, and for nearly all the technical engineering studies.

In modern times the higher studies in mathematics have acquired an almost supreme importance in the large affairs of the world; e. g., in financial budgets of nations and cities, in the mortuary tables used by insurance companies, in large engineering schemes for canal and railroad building and for irrigation, in banking and the financing of industrial and commercial enterprises, in the statistical tables of the census reports, etc.

**Economics.**—A group of economic studies has been coming into importance in high schools, such as commercial geography, the history and present status of commerce and the industries, economics and the elements of finance. The latter is usually relegated to college work. These studies are of great importance in explaining present-day conditions in society. They are of much interest to students of the secondary school, who are easily awakened to the current social problems. We are beginning to believe, also, that these studies are of importance for purposes of general culture and intelligence, and that it is the business of high schools to equip students for practical life in society as it is.

**Vocational Studies.**—Another group of studies of a still more directly practical value now constitutes an important part of high-school courses. These are business arithmetic, bookkeeping, penmanship, typewriting and shorthand. These have for their direct purpose the preparation of young people for business life. In cities and towns such studies are very popular and are usually associated with other studies of a more general cultural value, such as English, history, and mathematics.

The movement toward technical and vocational studies in the shape of manual arts is assuming great importance. This phase of secondary education is treated, however, in a separate article.

**Drawing and Design**, as taught in the art department of the high school, is the chief avenue for the cultivation of the aesthetic sense as exhibited in the graphic arts. Free-hand drawing and perspective, with a study of models and standard art forms, develop the taste for form and proportion. The elements of design and of ornament are developed in connection with free-hand sketching from nature and from models. Drawing is valuable not only as an introduction to aesthetic culture of many kinds but also as a training in accurate observation and in the power to express beauty. More recently free-hand sketching has been brought into close relation to design in the manual arts. Working drawings must be based upon preliminary free-hand sketching which develops design. Drawing as a general introduction to fine art and as a guide to artistic expression in all the industrial arts is becoming more and more important as a school study.

**Music.**—A high-school course would not be complete without systematic training in music and in physical culture. Even where there is little power to sing or play, appreciation for songs and musical compositions may be developed. The social life of the school as well as of the home is best expressed by music. Religious and patriotic sentiment, together with all the best phases of emotional life, are tempered and refined by music.

**Physical Training**, as developed in the more systematic exercises of the gymnasium and by the free athletic open-air sports, has become an essential element in the full growth of young people. It is especially

the case in cities, where a positive deficiency of physical training is apt to prevail. Strong, vigorous, athletic discipline, which produces a hardening and toughening of physical fiber on the playground and in the gymnasium, is universally needed. Only, this kind of discipline should be made a common opportunity for the great majority of boys and girls rather than for a small, overtrained minority. Young people of the high-school age should develop a sound, vigorous and healthy physical strength, which, well preserved, will stand them in good stead through fifty or sixty years of stress and strain in the regular exacting activities of mature life.

**The Small High School.**—There have been springing up in many states of the union a great number of small high schools with but two or three teachers. So great indeed is the number of these schools that more than one-third of the students in all our high schools are found in schools of not more than two teachers. In schools with six teachers or less 53 per cent of all high-school students are found.

These small schools, many of them in small villages and in consolidated rural districts, occupy a most important place in our school system. It is difficult for them to maintain a good high-school course. First, they are not able financially to employ very strong and experienced teachers. Secondly, they are tempted to lay out an elaborate four-year course suitable for larger schools.

Many village communities have been willing to tax themselves heavily for the purpose of supplying good teachers and equipment. In several states, as Wisconsin, Minnesota and Florida, the state has supplied a considerable aid in the founding and support of small high schools. For these small schools two important recommendations have been urged. First, that they furnish a good two-year course rather than a poor four-year course. After completing a good two-year course students may be sent to larger nearby schools to complete their high-school studies. Secondly, a very simple course, with as few studies as possible, is recommended, rather than a variety for election. In some cases, to give greater simplicity and fewer studies at a time, the work of two years is alternated.

The consolidation of rural districts, which has been going on in many states, has made it possible to have good high schools within reach of the great body of farm boys and girls. This is a very important movement for the improvement of country life. When this plan is well worked out it will bring to every boy and girl of our country districts the opportunity for a high-school training, and thereby the door is thrown open to the higher schools and opportunities of life. Consolidated rural schools become also important social centers in a still broader sense. Concerts, lectures, and reading rooms, made accessible by good roads, will do much to make such combined schools great factors in rural life.

The ideal set up for our school system as a whole is to furnish every boy or girl, whether in the country or city, an opportunity to secure a complete education, and to bring this opportunity directly to the home door of every child.

**Teachers in Secondary Schools.**—The efficiency of the secondary schools depends upon the character and qualifications of the teachers.

The greatest question of all is how to secure efficient, broad-minded teachers. The social position and recognition of teachers in the community have much to do with this effort to secure a strong teaching force. High-school teachers, by their character and attainments, should command general respect in the community. It is of great importance that the communities should hold teachers in high esteem for their professional, personal, and superior social qualities. Otherwise the higher standards of culture and discipline such as must prevail in first-class high schools cannot be maintained.

The greatest of all difficulties that our high schools have to deal with is the prevailing low standard of scholarship and of social life.

**New Community Ideals Needed.**—Our American communities are not yet strong and virile in their educational and social standards. There is a sort of universal decadence and looseness, a lack of tenacity in maintaining and pursuing strong ideals. The average family is indifferent to those higher aims. This makes it very difficult in our average community to maintain an energetic scholarly high-school spirit. The positive superiority of the teaching force and the unequalled recognition by the community of their authority and leadership in matters of education are primarily necessary. In Germany this strong spirit prevails very largely. The teachers in the *gymnasiums*, or secondary schools, are marked characters, commanding a positive respect in the community. The American people are willing to pay taxes and to support first-class schools, furnishing equal opportunity to all for higher education, but they have not yet learned to back up the teachers and the standards of the school by the firm support of the home and of a strong community spirit.

Strong, well-paid teachers, permanent in their positions and commanding respect for their successful experience and professional attainments, are absolutely necessary to the maintenance of first-class high schools. There is a steady movement toward improvement in these respects. These schools are still new and in the making, but there is good prospect that we shall yet work out the best system of public secondary schools that the world has yet seen. The teachers themselves by setting up good standards, and by progressive efficiency in their work, can do much to improve the character of the schools, but the people themselves in our local communities are the ultimate source of power and influence, and in our democratic institutions progress cannot greatly outstrip the prevailing standards among the people.

For this reason our school system has developed more slowly than secondary schools in France and Germany. The authority of the state, in those countries, has set the standard, and has imposed the conditions of higher education. Educational experts of the best ability have been employed by the state to work out courses of study and to administer the system. In this country, on the contrary, the people in each community, by their own free choice, have established, organized and supported such schools. Our school system is, therefore, a direct expression of the desires and standards of the people, and is broadly founded in popular consent.

**Social Life** in the high schools has developed in recent years some peculiar difficulties, and, in general, while this social spirit

and its forms of manifestation are of the utmost importance, it is as yet difficult to lay down rules for regulating it. There are two important facts peculiar to American high schools. First, they are mainly coeducational; second, they are purely democratic. The social life, therefore, whatever it is, must be laid out on a broad liberal foundation.

The scientific study of adolescence in late years has brought out more clearly the social characteristics of young people at this period of life. The social impulse at this age is strong, spasmodic, tumultuous, freakish, and is especially unstable and unpredictable. Excessive reserve and diffidence under some circumstances are balanced by boisterousness and recklessness in other cases. While they are frank and confidential with one another, they are often reticent and unapproachable toward their elders. But the instinct for personal friendship and social grouping is very strong. They respect able leadership among themselves or in their instructors. At no time in their lives do they more need sympathetic but firm control. The presence of boys and girls together in all the classes and social events of the school has both advantage and disadvantage, but so long as this condition must be met it calls for the best skill and wisdom of teachers to create a wholesome and respectful relation between them.

**Student Organizations.**—The high-school students have combined into a variety of social organizations, some of which, like the debating and literary societies, musical groups and orchestras, art clubs, and athletic teams, are on the whole natural and appropriate expressions of the natural instinct. Others, such as the secret fraternities and sororities, and such exclusive groups, that meet secretly in their own clubrooms in the towns, have caused serious evils which have menaced the school.

A committee of the secondary school department of the National Educational Association reported on the subject of high-school fraternities in 1905 as follows:

*Resolved, that we condemn those secret organizations, because they are subversive of the principles of democracy which should prevail in the public schools; because they are selfish, and tend to narrow the minds and sympathies of the pupils; because they stir strife and contention; because they are snobbish; because they dissipate energy and proper ambition; because they set wrong standards; because rewards are not based on merit, but on fraternity vows; because they incite a feeling of self-sufficiency among the members; because they are expensive and foster habits of extravagance; because they bring politics into the schools; because these societies exist to such an extent that they distract interest from study; and because all legitimate elements for good—moral, social, and intellectual—are better supplied to the pupils through the school at large in the form of literary societies and clubs under the sanction and supervision of the faculties of the schools.*

While the Greek letter fraternities have proved unsatisfactory as a solution of the social problem in high schools, serious efforts are in progress to meet the legitimate demands of social life in other ways.

**Legitimate Recreation.**—In addition to the literary and debating societies, the athletic and gymnastic events, the groups organized for voluntary readings in literature, science and art, the bands and choral societies, efforts have been made to provide receptions, class parties, excursions, dramatic entertainments, and suitable dancing for high-school students.

The high school itself has been developing into a social center where social functions are frequent, where lectures and concerts are provided, where the parents are

invited on special occasions to inspect the products of the school in manual arts, in cookery and dressmaking, in drawing and music. Class plays and dramatic entertainments are not infrequent, especially in commencement week. In communities where the people and the teachers have learned how to make the best use of the school plant, the high school becomes not only the place for the formal education of the boys and girls but also the intellectual and social center of the community. There seems to be no good reason why the use of the school building should be limited to eight hours a day, five days in the week, nine months in the year. On the other hand it may with great profit be used at any time for the social and intellectual improvement of the entire community. Lectures, entertainments, and social gatherings for all, may well be given in the high-school building under the cooperative leadership of teachers and citizens, thereby extending very materially the intellectual, social, and moral influence of the school. The people of communities in which this policy has been tested are very appreciative of the results. (See *The American High School*, Brown.)

In all these social diversions the quiet cooperation and control of various members of the faculty are presupposed. High-school pupils have not yet reached the stage of development where they can be turned over to their own volition in social matters. The natural tendency of our American life may have been to throw young people in the adolescent period prematurely upon their own resources. There has been too much of freedom and indulgence. There is necessity in the home and in the school for a quiet but firm control, and for a wise interference on the part of children and of wisely exercised authority on the part of parents and teachers. The fate that has overtaken the high-school fraternities and exclusive clubs is a definite proof and warning that children of high-school age have not yet attained to proper judgment and self-control for independence. They are still under the somewhat autocratic authority of the school and the home, and this authority should be definitely and intelligently exercised.

**The High School as a Social Center** is a favorable place where parents' meetings are held for the discussion of these social and school problems, and where plans can be worked out for a more intelligent cooperation of parents and teachers. One of the serious difficulties for most high schools is the strong tendency toward social dissipation which interferes with the school studies and exhausts the physical energy of young people by late hours and social excitement. Parents are often foolish in permitting this mental and physical waste. The high school greatly needs the support of intelligent homes in maintaining the high standards of the school and in discouraging social frivolity. The high school as a social center is a meeting ground where parents and teachers can come to an understanding on these important matters.

We may observe also that the high school is the only institution in most of our communities that has real power to set up and enforce for adolescents high standards of scholarship, vigorous mental discipline, and that steady continuity of effort which achieves important results. The family and the church are not equal to such tasks. The standard which pervades the intellectual and social life of any

community is on a distinctly lower plane. It is the special and almost exclusive function of the high school to tone up and strengthen the intellectual life, also to set up standards and ideals which will appeal to the enthusiasm of youth, and finally to teach youth to undergo the steady, persistent labor which changes these ideals into realities. Looked at from this point of view we can hardly overestimate the importance of a good system of high schools to the nation.

**Methods of Instruction.** It has been assumed by most thinkers that the general method of instruction in secondary education is quite essentially different from that of elementary education. The report of the Committee of Fifteen, for which Dr. William T. Harris was chiefly responsible, attempted to explain and demonstrate this difference. According to this view, elementary studies deal with the immediate aspects of the world, with what may be called facts and data. The secondary course deals with the separate, formal and dynamic aspects that lie next in order behind the facts of observation. That is, secondary education is chiefly employed in classifying and isolating knowledge into separate sciences. This principle, properly understood, may show us where to begin the secondary course of study, whether at twelve or fourteen years of age.

The elective system of choosing studies according to the needs or preferences of individual students has been generally introduced into high schools. It began in the colleges and universities about 1878 to 1880, and has gradually spread to the secondary schools. One reason for this is the great enlargement of the general field of study in recent years; that is, the multiplication of new and modern branches, such as natural sciences, economics, history, manual arts, technical and engineering branches, etc. It is totally impossible for a student to compass all these studies, and selection is necessary.

Another reason for elective courses is a closer adjustment to the ability and needs of students. The problem of adjusting studies to individual needs is a complicated one, depending upon our estimate of the disciplinary and culture value of studies, their vocational service, and upon the proper connection and organization of the studies themselves. The old classical course was very narrow, almost purely disciplinary, and was imposed upon all alike, regardless of natural ability or preference. Some high schools have gone to the other extreme of miscellaneous and loosely constructed courses, where the student is allowed to make almost any combination of studies giving a required number of units. The experience of the last thirty years, however, has brought some definite results in the way of well-organized courses, allowing considerable freedom of choice, while securing unity and strength in educational development. First, a number of standard courses have been worked out, each of which gives a connected liberal education, including the essential elements of culture. The student may choose and follow one of these courses best suited to his needs and preferences. Second, a student, in a few high schools, is allowed to choose somewhat freely among all the studies offered but is limited to a proper sequence of studies determined by the dependence of some subjects upon others. Third, certain studies are now regarded as fundamentally important to all courses, such as English, history and

mathematics. "At present it may be said that throughout the secondary schools of the United States there are prescribed: A foreign language, algebra and geometry, English, a science, and one year of history. This makes about two thirds of the course, leaving certain possible alternations to be made according as the student aims to enter this or that college, or to go into active life."—(Dutton and Snedden.) A thorough command of spoken and written English as gained through the study of grammar, rhetoric, and composition, and English literature, is now regarded as of fundamental importance to all students, irrespective of their special purposes in life. Fourth, high-school principals and teachers are expected to consult with individual students, and, after due deliberation, advise them as to their choice of studies and of courses, taking into view their preferences, their choice of a vocation, etc.

In small high schools with but two to four teachers the course of study must necessarily be limited to a few studies, and not much choice among electives can be given. As noted earlier, these small schools include more than half of the high-school population of the country.

High schools naturally adjust themselves to the needs of their local communities. In rural consolidated schools agriculture is taught. In commercial centers business arithmetic and bookkeeping are taught. In manufacturing and mining centers studies appropriate to the needs and demands of the people are offered. Our high-school courses present, therefore, a liberal variety of studies and of plans.

## INDUSTRIAL EDUCATION

Industrial Education, as now interpreted, embraces manual training, domestic science and household art, vocational and trade training, and high-grade technical training. It is important that the several parts of this wide range be carefully distinguished.

**The History of Manual Training for Boys.**—While many thoughtful people had deplored in the city schools the lack of a kind of education which should train boys to be both "able and willing to work"; while Carlyle had already said, that "man is a tool-using animal," and that "without tools, he is nothing; with tools, he is all"; and while experiments of vari-

ous kinds, at home and abroad, had been made in whittling schools, commercial shops, manual labor schools and in tool laboratories, as adjuncts to art schools, normal schools, and engineering schools, the first regular manual training school in which systematic tool instruction and practice was incorporated with an academic course of study of secondary grade was opened in St. Louis, Mo., in September, 1880.

The school was organized for boys of high-school age and grade as a preparatory department of the engineering school of Washington University. It was not a free school, and it has never been aided by public funds. Two or three years

later it was followed by similar schools in Chicago, Toledo, Baltimore, Philadelphia, and elsewhere in rapid succession, until manual training, closely resembling the original type, has spread over the whole world; sometimes on private foundations, but more often as an integral part of the public school system.

**Putting the Whole Boy to School.**—Manual training as originally conducted and expounded was essentially a culture study. Of course it was and is useful objectively as well as subjectively, as all sound culture is. All true culture is serviceable, and the greater the service the finer the culture; non-serviceable culture is inhuman.

What is now known the world over as a manual training school is organized:

1 To develop the whole boy by exercising every part of his brain.

2 To enable a boy to discover his unborn capacities and aptitudes.

3 To lay a broad foundation for a higher education.

4 To furnish those who look forward to industrial life an opportunity to master the knowledge of the materials, drawings and methods of construction, as well as the academic subjects usually taught in a high school.

**The Fruit.**—Manual training is no longer an experiment. The conspicuous record of thirty years' experience is that the young men thus trained have brought to the ordinary duties and responsibilities of life, intellectual and mental grasp of actual conditions which has at once gained for them a clear advantage. They have shown that some mechanical skill and a great deal of mechanical comprehension and power of mechanical analysis have been valuable assets, and not unfit accompaniments of refined tastes and good manners. The training has opened new roads to modern scholarship, and new avenues of usefulness to many a lad, and has enabled many others to choose their occupations more wisely, either in the direction of the industrial arts or in other fields.

**The Method.**—The tools studied and used are those requiring delicacy and skill, embodying wealth of thought and experience. They are studied separately, and correct usage is mastered gradually.

Particular care is taken to teach correct theory and the best usage. There is a possible elegance in handling a tool, as there is in handling the painter's brush. The untrained "wood-butcher" is obsessed by a desire for originality, and the result is a bad form which perpetually fetters him. The teacher of tool-work must teach the best, and his work, his choice of tools, and his sequence of steps must be of the highest grade. Coarse, heavy work involving nothing but brute strength and repetition is avoided. Woods and metals are the chief materials studied and wrought. The emphasis is put upon processes, upon order, and system.

**Where the Value Lies.**—The aim is intelligent mastery and the power of mechanical analysis. The value of the finished article or exercise lies not in its subsequent use but in its embodiment of ideas of fitness, economy, accuracy, grace and appropriate finish. Every detail of form is first written in the language of drawing, in the making and reading of which the student must be an expert. The materials wrought must be real and suitable. No make-believes, like wooden swords, paper bridges and unscientific designs, are tolerated.

There is no fear of a lack of interest or of failure to develop a love of service. The possessor of cultured mind and a skillful hand finds pleasure in service as naturally as a ripe peach carries pleasant flavor. Parents and casual visitors are apt to overrate the value and significance of show pieces, which invariably represent great misuse of time, loss of breadth and thoroughness, and, too often, borrowed workmanship. It is well to postpone practical jobs till vacation and the spare hours of holidays. Again and again critics who ask about marketable products are told that the only article put on the market is well-trained boys.

**Fundamental Rules.**—While the mechanic arts may be applied in a hundred different occupations, there are many typical processes which are common to all. The care and proper use of cutting edges; the analysis and command of machine tools and implements; the influence of heat upon both woods and metal; the study of form, and a recognition of the conditions of stability, strength, and stiffness, involving a cultivated sense of proportion—such things are of universal value, the well-trained boy is quick to see their application in the various occupations of modern industries.

**Not a Factory.**—A manual training school does not aim to be a factory. As soon as a boy has mastered all the elements of a complex construction, he should then aim to complete it; when he has become able to produce a satisfactory article of domestic or commercial use, he should proceed to learn something else, not stop to produce it. There is no educational fruit in doing again and again what one already knows how to do well. There may, of course, be economic fruit, and therein lurks one of the perils to which manual training is exposed; viz., the thirst and hunger for production, for "making something."

With a very little training a boy can make pieces of furniture which is creditable for a boy; but much too often the time is not well spent. Of course occasional synthetic exercises should be introduced to show the relation of parts, the necessity for precise work, and to cultivate the taste and judgment; but uneducational repetitions and premature combinations should be avoided.

**Class Instruction.**—The skillful teacher teaches the proper care of a tool, its correct usage, and a typical process, to all the members of the class at once, with great fullness of both word and deed. Exact methods are clearly shown; there is no fear of checking the growth of individuality, just as there is none in teaching Latin or orthography, arithmetic or music. Synthetic exercises, or projects, are individual, selected advisedly from local suggestions.

**Shop Equipments.**—While only the best tools should be used, no attempt should be made to rival commercial shops. Lathes, planers and drills need not be large or very expensive; no school for boys should be able to boast of doing heavy work suited to skilled mechanics; such boasting would be a discredit. All edge-tools in frequent use should be individual, and their condition, as well as the private tool-drawers of class members, should be frequently inspected. In every large shop there should be special provision for the class lecture and demonstration.

**The Materials Used.**—Woods, hard and soft, fine and coarse, easy and difficult

to split; of various colors and shades; green and seasoned; iron, cast and wrought; steel, hard and soft, brittle and malleable; brass and alloys—all are intelligently studied. Much economy is possible by causing the same piece of stock to illustrate a series of processes; for example, a short piece of a steel rod may successfully serve for an exercise in turning a plain smooth cylinder of given dimensions, next, for cutting a screw with a definite thread and pitch; next for turning a taper of given diameters and length; and so on. Just as a chemical reaction or a cooking process may generally be shown in a test tube, so important mechanical details may be illustrated with the use of a small amount of stock.

**The Schedule of Hours.**—Ten hours per week should be given to shop and drawing combined, and a single exercise should rarely exceed two school periods. When the limit of close attention and lively interest is reached, education stops. The factory boy may work all day, repeating almost automatically a few motions, but his stimulus is the money he is earning, not educational progress through mastering a new tool or process. In short, the commercial shop furnishes no guides for the manual training school. In form, in spirit, and in procedure, it is widely at variance.

**Manual Training for Girls.**—The immediate success of manual training in promoting mental clearness and practical efficiency in the case of boys, early led to the organization of corresponding courses in domestic science and house hold art for girls, and to an extension, in elementary forms, of those new features for both boys and girls, downward to more or less of the grammar grades.

In many cities, as for example in St. Louis, manual training or domestic science is required of all pupils of the seventh and eighth grades of the public schools, and both are offered free, in fully developed forms, in all the high schools.

**Needlework,** carpentry, is chiefly joinery. The carpenter learns how to connect properly and securely one piece of wood with another; so the seamstress learns how joints can be made and how one piece of goods may be fitted to another. The fundamental stitches should be learned one by one, and then comes the art of cutting to fit and cover. The making of garments should not be introduced too soon but should be constantly held in view.

**Instruction Before Construction** is as important, in needlework as in arithmetic or cabinet work. The nature and uses of different yarns and threads should be made clear, and incidentally every girl should learn how to darn and mend. Propriety and economy should be taught by precept and example. A few hand-made garments, selected for the purpose of illustrating the uses of what has already been mastered, may well crown this part of the course, but excessive repetition must always be avoided.

**Machine Work** should supplement handwork, and pupils should be made to see the strength, beauty, and economy of machine work. The sewing machine itself is a fine object for careful study. Its proper care and various functions form an excellent series of lessons, which, as a rule should be, not individual, but to all members of the class at once, as detailed for boys under "Method" in the earlier part of this article.

**Dressmaking and Millinery.**—The elements of both these branches should be covered in a general way, but the emphasis can be put where local interests can be best served. Great importance attaches in every community to a proper knowledge of the nature and uses of woven goods for garments light and heavy, napsery, hats, drapery, and carpets.

**Economy and Thrift.**—No teacher should fail to impress the necessity of economy and thrift in the making, purchase, and care of garments. Cleanliness is a cardinal virtue, but all unreasonable wear and tear in the laundry should be shunned. A few lessons on the nature and influence of soap, and the processes of washing, ironing, starching, etc., are valuable for every girl.

**Equipment for the Sewing Room.**—The sewing equipment need not be expensive. A few machines of various makes, including a "blind-stitcher" of the best design and some laundry fixtures, are all that are necessary; the main thing is a competent and well-trained teacher—but here is no exception, for such teachers are needed everywhere; all our special instruction would be wasted on ignorant and untrained teachers.

**Cooking and Household Arts.**—It is safe to introduce one's remarks on cooking with a "don't." *Don't begin with a cookbook*, which is only a collection of recipes, good, bad, and indifferent. Begin with fundamental principles, as is done in every other department of education.

A second don't may well be: "Don't take it for granted that the class must begin to cook meals at once. Teach and study processes. Take a simple article of food which requires cooking, like a potato; it may be boiled or steamed, or fried or baked; or two of these treatments may be combined to advantage. Make notes of temperature, moisture, and time. A single potato will suffice for a great deal of instruction and practice. Do not be afraid of test-tubes and Bunsen burners. When a specimen is to be tasted, pay great attention to seasoning and flavors. Good material, well cooked, is often served without seasoning or flavor, and as a consequence it is almost unpalatable. On the other hand poor material, well cooked, seasoned, and flavored, is eaten with a relish. Some chemistry will be introduced by the good teacher, but it should be carefully adapted to the age and attainments of the class. The effect of high temperatures in forming a closed covering or wrapper for meats and pastry; the release of gases whereby bread and pastry in general are rendered porous and light; the proper temperatures for cooking eggs, heating milk, baking bread, and stewing fruit—all such things should be explained, illustrated, and made reasonable. All the while teach the habit of weighing and measuring, when exact weights and measures are required. Many things must be learned by experience and observation. As the artist said, he mixed brains with his paints in order to get the right colors, so the skillful cook must put judgment into every dish.

**How Not to Do Things.**—It is often well to prove that the obvious way is the wrong way, by producing a worthless product. Bad methods of cooking are common, and hence they should be pointed out, and illustrated, so that they may be avoided. Unfortunately "Mother's way" is not always the best way, and the careful teacher should show where it goes wrong

or is lacking, and how it may be improved. It is always best to crown every point achieved by an edible dish, but do not allow unwholesome preparations to be eaten. There is no economy in eating stuff that should at once be thrown to the hogs. On the other hand there is no end of economy in keeping and skillfully serving "left-overs." Some things are better the second day, and many things are best so deftly prepared and combined that they appear to be dainty originals.

Every girl should learn how to set a table, cook and serve a meal, wash and put away the dishes, and keep a kitchen and pantry clean and in perfect order.

After plain, ordinary cooking, should come fancy preparations; food for infants and the sick, preserves, jellies, etc. In a word, the mistress of a house and home should be so trained herself as to be always able to give directions, and if need be to instruct her cook, and to take her place.

**Housekeeping.**—The above specific lessons to girls, should be supplemented by a few elementary lectures upon housekeeping, house-planning, and decoration, and upon the functions and responsibilities of motherhood.

**Culture and Use.**—Thus far the aim has been the development of the hand and the both boys and girls, with study of appliances in processes which are essentially useful, and which may later on be put to practical use. The intelligent, alert mind is held to be first in importance, but the possible practical use of the training has not been ignored. There has been no bias toward particular vocations; all doors are left open and the ambitious youth should make the most of them and impartially. Culture and usefulness should characterize the training of every one whose circumstances will admit him to such advantages.

The following paragraph is quoted from one of our most thoughtful educational writers, Mr. James P. Monroe:

"The next genuinely educational business before a community is to prepare the child for that industrial usefulness, to himself and to the community, which is fundamental to good citizenship. He is virtually but half educated so long as he has not acquired such necessary industrial qualifications as manual control and dexterity, cooperation of brain and hand, quickness of adaptation, fertility of resource, concentration, 'gumption,' and has not been given, on top of these, ample opportunity to secure the groundwork of some special trade or industry. Without such essentials he is likely to join that appalling army of 'floaters' who, without a trade or any chance of learning one, wander from one casual occupation to another, depressing wages, inducing enormous industrial waste, and swelling at last the costly ranks of vagrancy."

It is the height of folly to train either a boy or girl without some reference to future needs and responsibilities. As well teach a Choctaw the use of an Australian boomerang, or how to play on a Siamese tom-tom, as to spend his precious youth in learning the rudiments of subjects utterly remote from his life and probable duties. In America, occupations are as a rule not inherited; but circumstances in a great majority of cases plainly indicate not only what is possible but what is probable, and the wisest preparation for future success.

**Vocational Training.**—The vast majority of boys must start as manual workers, and public education should ever be shaped to meet the needs of the majority. Hence vocations should be kept in view. The resources of soil and mine; the energies of wind and stream; the wealth of inherited skill and cunning inventions; the hundreds of industrial processes in shop and field—all should be conserved and utilized. The judgment of educational leaders to-day is that we should make the courses of study offered in our schools more democratic, that they may meet the conditions of our modern commercial and industrial life.

Undoubtedly the most vital educational and social question of our time is what to do for the multitude of boys who now leave school too early. For every thousand young men who pass through certificated schools and enter colleges of letters and schools of engineering there are four or five thousand others, capable and worthy, who never stand on the threshold of a secondary school, much less knock at the door of a college.

It is an exceedingly important fact that each one of these thousands of boys who do not enter the high school and who, as a rule, go no more to any school, is entitled under the law to an education as well suited to his needs in a career as an industrial worker as is the boy who wins a certificate and who expects to go to a college or a school of engineering. Beyond question the welfare of the nation is as much dependent upon the proper training of the former as upon the proper education of the latter. The greatest burden our country is carrying to-day is the tremendous army of untrained, uneducated laborers.

To lighten this burden, and to thereby promote the public welfare, both grammar and high schools should embody industrial features in their curriculums.

**In Rural Schools.**—Where boys of from 12 to 18 years are in attendance, not only the use of hand-tools for working wood in the construction of joints, frames, and shelters, but the fundamental principles of agriculture, horticulture, the raising of stock and poultry, dairying and the culture of flowers and vegetables, should be taught. Boys from the farm should be taught the uses of farming machinery, and how to properly care for it when not in use. Tools are ruined by rust and exposure more than by proper service. It is no mean art to properly sharpen and preserve edge-tools.

**All Wood and Metal Occupations** should begin with a careful study of the theory and functions of hand and machine tools, and with systematic instruction regarding processes as outlined above. Thus the doors are opened wide to scores of useful trades where tools and processes are specialized and applied.

With all such work mechanical and free-hand drawing should be learned, so that a boy can readily read and make drawings for shop or home use. Skill in free-hand drawing based on mechanical lines is easily acquired and very useful. Isometric drawing is extremely simple, as is cabinet perspective.

Vocational training has for its chief aim a mastery of the tools, materials and processes of a particular trade or occupation, accompanied by mechanical drawing suited to the occupation; hence vocational training is much less broad, though in some directions much more intense, than

manual training. For advanced pupils it becomes trade training; for boys of from 12 to 16 years it offers a field for developing the strong points of those who are slow and inept at the ordinary book-work of the grammar schools, and who under present conditions drop behind and so drop out of the schools wholly. The aim of vocational training may be said to be to discover a boy's bent or bias, and then to develop him along that line.

#### Trade Schools and Trade Training.—

This problem has been attacked in various ways and from different sides.

The employers of skilled labor all across the land have learned that the best workmen must be taught both the theory and art of their trades. Railway companies, electric companies, metal-working establishments, and makers of goods of all kinds, train their own foremen and skilled workers in what is, in every case, a trade-school annex for a particular trade. There are hundreds of these annexes organized in a variety of ways, more or less original, with some ideas borrowed from Europe and many from each other. A characteristic of them all is the employment of teachers who are skilled workmen, and who have had sufficient experience to know what the theory of the work involves, and who are competent to teach the underlying principles fairly well. Another characteristic is that the young apprentices are paid by the hour whether they are in the school annex or in the shop.

The conditions of admission to these apprentice classes vary with the mental and physical demands of the trade or occupation. The minimum age varies from 13 to 17 or 18, and the academic standard varies from the sixth grade to a high-school diploma.

There is very much to be said in favor of this solution of our problem. Many of these schemes reach down low enough to get hold of members of the "neglected half," and to the extent of such employment they are doing great good. Moreover, the benefit to the companies and the community is great, for the result is better workmen, better work, and an undoubtedly greater interest in and loyalty to the company. The only criticism is that the training is narrow and there is in consequence a lack of versatility.

**Private Trade Schools.**—The second partial solution is that of trade schools on private foundations. Here the great difficulty has been the cost. The expense for buildings, equipment, teachers, etc., is prohibitive except in the case of a rich benefactor like Auchmuty in New York, Williamson in Philadelphia, Carnegie in Pittsburgh, Wilmerding in San Francisco, and Rankin in St. Louis. In some such schools tuition is free—in others small fees are required. In some the course of study is very short, say four months, and of course very narrow. In others it is three or four years long, combined with a full academic course, but in every one the technical range is narrow.

But all such schools, excellent as they may be, are but a drop in the bucket. It is reported that the Williamson school of trades in Philadelphia, which reaches down to the level of the class we are now interested in, cannot take in one-fifth of those who apply; and the private trade schools and the corporation-annex schools combined do not cover one-tenth of the ground. There is much left for the public schools to do.

**Public Trade Schools.**—Public trade schools supported by taxation are rare. The most conspicuous is the Technical high school of Cleveland, Ohio. This would be a regular manual-training high school were it not for the fact that, during the third and fourth years, the work in shop and class is directly aimed at four or five distinct trades, thus making it a public trade school. Incidentally, the school program embodies an innovation which is full of suggestion, viz., the school year consists of four equal terms of twelve weeks each—there being a week's vacation at the end of each term. The immediate popularity of this school should teach boards of education a useful lesson. Though built and equipped for over a thousand pupils two years ago, it is crowded and a second school of the same character is in great demand.

[It is interesting to note the effect of this extraordinary demand for industrial high schools upon the devotees of the traditional classics. The Cleveland board of education was recently petitioned to authorize the building and organization of a new high school which should be exclusively cultural, i. e., a school "in which nothing useful would be taught."]

The Portland (Ore.) school of trades, with day and evening classes, is a part of the public schools; and the evening trade-training department in the Technical high school of Springfield, Mass., is a part of the public school system. It gives promise of much more along similar lines all over the land. It should be borne in mind, however, that all evening-school training work is given to those who, for better or for worse, have already found employment.

If one were to compare the best trade schools with corporation schools he would find that the former give a broader outlook, owing to their generous academic program, and a greater range of shop processes; but the graduates of the latter excel in skill and finish of their work, and a knowledge of a particular business. This last is a matter which cannot be gained in a schoolroom; business and shop management must be learned outside of school. A few general principles may be taught and illustrated, as may banking and railroad accounting, but the organization and management of a business is largely a personal matter, and the chief clerk and the general manager have generally been trained for their work in the business itself.

**Cooperative Schools.**—A fourth partial solution of our problem is that in which manufacturing concerns join forces with boards of education for the purpose of training educated workmen who later on may become foremen, superintendents, and general managers. The manufacturers furnish shops and shop instruction; the high school furnishes teachers of drawing and academic studies. The plan may be best illustrated by an account of what has been done and is now doing in Fitchburg, Mass.

**The Fitchburg Scheme.**—Fitchburg is an active industrial city of about 30,000 people, with numerous large manufacturing establishments, so that the situation is particularly favorable for an experiment in industrial education. For some years this subject has been under discussion in social and business clubs, and a state commission appointed by the governor visited the city, and plans of an industrial school were proposed, and discussed for some time. Finally the cooperative plan was adopted and put into operation during the summer of 1908.

The plan of organization recites that an employer is bound to furnish systematic instruction in the use of specified tools and processes, such as may be agreed upon when the contract is signed. The tripartite contract, signed by pupil, parent, and manufacturer, lays down the rules and regulations governing the attendance and work of the apprentice pupil. It specifies that the school course shall cover four years, the first year being wholly in the high school; the other three years the student is in school alternate weeks, twenty each year. It specifies further that the other twenty weeks of the school year and ten of the vacation weeks are to be spent by the boy in the shop—thirty weeks of fifty-five hours each, Saturday being a half-holiday. It further specifies that during the first of the shop years the boy shall receive 10 cents per shop hour; during the second year, 11 cents per hour; and during the third year, 12½ cents. The average amount is a little over \$180 for each of the three years. It further provides that any time lost during any year is to be made up before the next year can begin, and that no diploma or certificate can be given until all lost time is made up. Finally it specifies that the apprentice boy shall carry on successfully the course of study laid down for school work, and that if any failure exists either in the boy's performances of work in school or in the shop, it will result in his being dropped out of the class; and the vacancy shall be filled, as soon as possible, by another boy.

The scheme has just recently closed its second year of shop work, there being at the present time a first-year class of twenty-one members in the high school itself; a class of twenty spending their second year in the high school and their first year in the shop; and a class of twenty-one spending their third year in the high school and their second year in the shops. Teachers, pupils, and manufacturers agree that the plan works well, and that a lively interest is sustained. There may be similar experiments elsewhere, but there is limited data concerning them.

**Advantages and Dangers.**—If this scheme stands the test of five years' trial there will be much to commend it.

In the first place, it appeals or may appeal to the neglected or dissatisfied boys who cannot or will not march to the tune of the common curriculum.

In the second place, if the cooperating employers live up to their contract, the shop work is certain to be attractive, the progress made will arouse ambition, and the correlation of mathematics, sciences, and drawing with shop work will prove to be a great stimulus to brain activity.

In the third place, this scheme of cooperation enables the public schools to help do what the schools could not superintend and foreman. He sharply questioned the boys as to their school work, and got their grades from the supervising principals. One-half of them had already dropped out of school or would have dropped out had the plan of cooperation not been offered. The boys were assigned

in pairs, and the members of each pair alternated, a week in and a week out, and it was found that partners kept closely in touch as in both shop work and school work. The resulting fellowship of interest seemed to be an admirable feature.

The attitude of the bondsmen and the parent or guardian was favorable—enthusiastically so. The shops paid the boys almost \$200 a year, which was nearly enough for food, clothing, and shelter, with a good trade in prospect and a knowledge of a good business besides.

The Fitchburg scheme reminds one of a fine definition of a good bargain—it is one in which all parties gain. The employers get what they want, a better grade of workmen, broad-minded and skillful; and the school authorities get good citizens—thrifty, intelligent men; the boys get what they want, technical skill and a chance for promotion. In short, the scheme promotes industry and the common weal.

**A Warning.**—There are, however, positive dangers to be guarded against which teachers and parents should keep well in mind. The money earned may have a corrupting influence. If it is foolishly spent, the effect is certainly bad; if it is turned in to help father or mother, and to pay for one's keep, it is fine; if it is saved for future use in college or a professional school, it is well. But in no case should the boy be induced to undervalue studies which fail to yield immediate financial returns. The price of wisdom is above rubies.

**The Most Essential Thing.**—Industrial work of all grades is too often regarded as handwork and nothing else. But handwork and nothing else has been the fate of four-fifths of the boys and girls in the past. Beyond the "three R's" the boy who felt that he must "work for a living" found little in school books and school teaching calculated to help him on the farm or in the shop. Accordingly both the boy and his parents believed that it was time for him to go to work early in life.

Hence the working man, young and old, was ignorant of the rudiments of science and polite learning, and was utterly lacking in ordinary culture. The academies and high schools were organized and maintained for college boys. They taught Latin and Greek instead of physics, chemistry, mechanic arts, and mechanical drawing.

To-day, things are changed, and the secondary schools are conducted for both the college boy and for the industrial boy—or rather every boy is given a chance to combine the culture of the shop and drawing room with that of the recitation room and of the laboratory, and the stigma of ignorance on the one hand and the charge of practical unhandiness on the other is no longer just.

Hail to the skillful, cunning hand!  
Hail to the cultured mind!  
Contending for the world's command,  
Here let them be combined.

Such is the doctrine at the present time. The industrial student should see to it that the two are "combined."

All knowledge, science, and art are not written in books, but much of them is. Good books are a mine of wealth, and every aspiring lad should learn to read and study them. Not shallow, silly stories of flashy, sportive boys, and boy-dens, unwomanly girls; but true histories and true biographies of great men and women—inventors, engineers, artists,

reformers, statesmen, and authors. Nothing more adorns a good workman than correct speech and graceful composition, just as nothing more quickly condemns a young man untaught and unworthy than bad English speech and wretched composition. Let pupils and teachers keep these words in mind.

**Whims and Fancies Are Dangerous.**—

Finally it is a sad mistake to take seriously a boy's early whim as to what he shall study and what he may neglect; just as it is wrong for a parent to persist in training his son to a predestined career—without an adequate knowledge of the lad's mind and natural bent. Great engineers, inventors, general managers and teachers, are as truly "born, and not made" as are poets, artists, and orators. It is the function of the school not only to develop the whole boy, but to discover in which direction that development may be most fruitful in character and usefulness.

**Technological Training** is for young men of strong, clear minds, who have a desire to master and apply mathematics and the principles of science to the practical affairs of modern life. Such men are ambitious to become engineers or architects, to build bridges, to plan and construct public works, and to organize and administer manufacturing plants, which shall embody the latest discoveries of science, the best styles of construction, and the best methods of securing economy and efficiency of operation. The accomplished engineer is well educated; he is no mere engine driver, or ordinary mechanic. He can, of course, if there be need, manage an engine, and he can use fairly well every tool in the shop; yet his chief function is to do the head-work involved in preparing plans and specifications, and in directing, supervising, and inspecting the work of construction. Technological training is the logical outcome of manual training, though by no means the only outcome, since all doors are open to the boy who has completed the full manual training course of correlated studies.

**To Be an Engineer,** a boy should absorb all that the secondary school can give in the way of mathematics, physics, chemistry, English, manual training, and drawing. If history and French can be added, so much the better.

Then he should enter a high-grade technical school with excellent engineering laboratories, in which the constructive

properties of engineering materials may be learned from actual tests, and in which typical engineering appliances and operations may be studied and made familiar.

All advanced work begins with a design; and that design is based upon the properties of the materials used, as well as upon the end to be attained. The physical properties must include strength and elasticity as well as beauty and durability; and a scientific designer must be able to calculate the stress in every individual member of a construction, and just the forms needed to have the necessary strength and stability. All these calculations involve the principles of mechanics which are expressed in the language of mathematics far beyond the range of grammar and high schools.

To be a technical man worthy of the name one must master first the so-called higher mathematics, and then he must master applied mechanics, which deal with force; the stability of structures and frames; the motion of heavy bodies; the development, transmission, and utilization of energy—all of which are expressed in mathematical terms.

**Technical Terms Must Be Understood.**—

Nothing is more important than the exact meaning of technical words and the precise meaning of mechanical and engineering units. We are all pretty familiar with such units as a *pound*, a *foot*, a *horse-power*, and a *second*; the engineer must be equally familiar with a *moment*, a *radius of gyration*, a *kilogram*, a *meter*, a *volt*, an *ampere*, a *watt*, etc.; and this familiarity can be gained only by study and practical use.

All this cannot be learned and comprehended by merely reading formulas and definitions in books. Moreover these things take time. One is not an accomplished engineer by birth, nor in a single session of a winter school, nor by working in a shop. Such matters help, but they do not suffice. Innate capacity is an essential; a single term under good guidance may open the door and give one a good start; a shop and a field party may be very useful in getting at the full meaning of terms and in learning how things are done. But the language of mathematics and applied science requires time, steady work, and mental growth. Every boy should get seven or eight years of such growth in high school and engineering college, if he aims at superiority.

## NORMAL SCHOOLS

tions that are organized and conducted for the special purpose of training teachers are called normal schools. Their entire work consists of educating and training men and women for professional careers as teachers in public, parochial and private schools of kindergarten, primary, elementary and secondary grades. The majority of such schools are founded and maintained by the states, and since these are so well supported and so efficiently managed, they determine

the standards and the character of work required of all institutions that adopt this name. These schools require of students the study of scholastic and professional branches of knowledge that are essential to the vocation of teaching, and in addition exact specific training of the capability to teach by giving opportunity to put into practice the knowledge and the theories they are taught.

**Other Names.**—The name "state normal school" is commonly given this class of educational institution, but in some states other titles are used to designate that they are teachers' training schools, such as "state

normal college," "state teachers' college" and "state normal university." When these latter names are used it is intended to imply that such institutions are of somewhat higher grade or are organized on a more elaborate plan or are assigned a larger province than those designated as state normal schools. While this is the inference, the fact still remains that the extent of the province and the size of the opportunity to be finally assigned these educational institutions have not been absolutely determined, as the years of the movement have not yet been many enough, and public experience has not yet been extended enough, to determine the scope and the province that the governmental need demands.

**Organization.**—The function of the normal schools has been more largely determined by statute than by custom. Their province has been created to meet a definite, emergent condition found in the development of universal education, and their development has been of a character and of a kind that are much different from those of the college and of the university. They came into existence by the order of legislative assemblies in response to public demand for amelioration of prominent difficulties in the teacher-supply problem, and they were given immediately a support, an authority and an opportunity that no other kind of public educational institution had ever had. They were at once recognized as necessities rather than possibilities, and they opened up a special opportunity to prepare for a vocation that gave promise of permanent occupation and reasonable self-support. These conditions insured an immediate patronage, an unusual popularity and an unprecedented success, since everything contributed to make their work vocational, practical and acceptable.

**Board of Management.**—They were organized in conformity to custom, the legislatures providing boards of management that were authorized to expend the appropriations for financial support that were granted, and to provide ways and means for the proper conduct of the work desired. These boards had supervisory rather than executive control, and hence provided a faculty of scholarly, skilled teachers to have direct control and management of these institutions.

**Faculty.**—They appointed a president, determined the departments, employed professors, assistant professors, instructors and assistants, adopted general regulations governing faculties and students, authorized courses of study that gave promise of meeting the requirements of public demand for well-educated and well-trained teachers and provided the conditions that should be enforced in admitting, instructing, training and graduating students. The system of management has been very similar to that instituted in colleges and universities, but yet decidedly different, in that it depended upon a more limited program of studies, avoided the tendency to extreme election of lines of work by the students and emphasized the instruction as being specially given to prepare students for a single vocation.

**Function.**—These schools have varied much as regards their interpretation of the function assigned, but they have never been permitted to depart from the true purpose that was assigned by legislative act. Their immediate popularity and prominent success were so notable that other institutions that were organized for cultural and

disciplinary education, and whose aim was training for life rather than for special vocation, decided to take advantage of the wave of popular favor and secure for themselves a part of the young men and women that were desiring to enter the business of public school teaching.

**College Ideals.**—To accomplish this, courses of study were planned that were in imitation of those offered by normal schools, but that were less practical and less vocational, in fact, because they depended entirely upon lectures and class instruction and ignored the notion of actual training in teaching through a specially organized training school.

**Duplication of Effort.**—This duplication of endeavor has founded schools of education, departments of pedagogy, chairs of didactic, and teachers' colleges as parts of courses offered for bachelors' degrees in colleges and universities, and has also led to organizing schools for teacher-training of secondary educational rank that are more local than regular state schools and that are named junior normal schools, county normal schools, city normal schools, city training classes or similar designations that undertake to show that they limit their education and training to elementary teacher preparation of a very moderate quality or grade.

**Variations.**—Since this class of institutions came into existence by legislation in the several states, since they are all products of an endeavor since 1839, since the different states were themselves in a much different condition of organization, settlement and development at the time of founding, such institutions, there would be much need of variation in their plans, their intended scope of endeavor and their claims for recognition.

**First Type.**—In the older states endowed colleges and universities, independent of state control, were organized and maintained on excellent standards before the normal school conception of teacher-training was developed. In such states the normal school became a supplementary institution to do an educational work that was omitted and overlooked by the system in existence.

**Second Type.**—In the newer states higher education was unsettled and undeveloped because of the rapid settlement and expansion of territory at this time and, hence, such states not only founded normal schools but also state universities and state colleges of agriculture and mechanic arts. Here the normal schools have become institutions in every sense of the word and have gained a rank and a success that is not inferior to that held by the other institutions of higher learning.

**The Typical Normal School.**—Although the state systems have developed a normal school particularly adapted to the actual need of the individual state, yet there is much in common that differentiates them as a class from all other kinds of higher and secondary education. The typical normal school is both a higher institution and a secondary institution, if by these terms are meant the standard of scholarship possessed by their students on being admitted to begin work, and if certain branches of study commonly taught in high schools are classified as secondary studies. All normal schools have in their courses of instruction branches of study that are commonly found only in colleges and also branches of study that are commonly found only in high schools.

**Reason Given.**—This is due to the fact that their function is that of preparing teachers

for public schools. Hence these normal schools must admit to their courses persons who are now licensed teachers in the states where they are located and that have maturity, experience in teaching and development of personality, and who by such instruction are enabled to be better prepared for the business they are following.

**Teachers in Service.**—This class of workers is very large in numbers in the majority of the states. Not having had opportunity or financial means to go to either high school or college they have begun teaching as soon as they reached the age limit set by law and were able to pass the scholastic examination that is legally required for a teacher's certificate. This actual state of affairs has made the normal schools conduct their work to comply with a condition rather than to seek to respond to some line theories regarding what persons ought to be authorized to be teachers. They found the teachers in service needing to be improved, and they have met this demand as fully as time and means and attendance could make it possible.

**City Demand.**—In addition, there has been a growing sentiment in cities and towns that teachers should be educated and trained before being admitted to the public service. These cities and towns, being independent of state or county control, more or less set their own standards of teacher-education and demand certain qualifications beyond high-school education of all candidates who sought employment. Many of them said it was necessary for all these teachers to be either normal-school or college graduates.

**Expansion of Field.**—This standard requirement enabled the normal schools to offer courses of instruction and varieties of work that belong to college student ages and preparation, and in this way young ladies and gentlemen who were inexperienced in teaching and who desired to be specially prepared for such work found a place in this class of institutions. They are taught in separate classes from the practical teachers, they are given scholastic subjects of college-grade rank, they are given different instruction in the science of teaching, and they are given laboratory work in the actual teaching of children that is specially adapted to the specific kind of educational work they have decided to undertake.

**The Two Phases of Work.**—As a consequence of these conditions normal schools are practically conducted as schools with two distinct divisions of work, from either of which students of right age and development may graduate, each kind being equivalently prepared for the career they desire to follow. The fully mature, experienced, practical men and women can be given an education that fits them at their time of life for the most effective and specific service, without taking the number of years in preparation that a child would necessarily be obliged to take who entered the kindergarten and followed the standard curriculum of the primary, elementary and secondary school to the end, graduating at about seventeen years of age.

**The Mature Student.**—The individual who desires education after childhood and youth have passed is not adapted mentally to either the methods of instruction, the progress of the work or the details of information that are deemed suitable to those of younger years. For that reason the

normal school provides for such the instruction and the training that are demanded by their age and development. To such students the taking of such branches as algebra, geometry, rhetoric and botany is quite a different task from what it is to the pupils of the secondary school age. To meet this situation the normal school adapts these studies to the educating of the mature mind and the college age development that such students possess, and it has found such instruction to possess the highest value and to be of the largest importance in securing the results sought—a well balanced and a thoroughly trained mind.

**The Scholarastically Trained.**—In like manner with students who have had standard high school preparation and training. They are different in their knowledge, they are keener in their scholarship, they are more accurate in their language, they are more ready in their student-ship, and these things require that they be treated as students of full college grade. They are not usually trained for high-school department work, for the kindergarten and for primary grades, they have more breadth of possibility in foreign languages because they began them in youth; they have more versatility of possibility of after occupation, but they are no more likely to become prominent in executive work as educators nor in distinction in success in many fields of teacher business than the first class of students, known as practical teachers. Under the conditions that exist in the teacher-supply situation the normal schools have no choice as public institutions but to do all they can to produce a supply of trained persons to meet the demand that the public service constantly makes.

**Conditions of Admission.**—The standards of admission that are enforced as especially belonging to a teacher's training school are such characteristics as (1) age, (2) experience in teaching, and (3) scholarship possessed. Of these age is particularly of great importance, since the preparation for such a vocation demands full maturity of mind, a thorough conception of what is being undertaken in getting ready for a career and a serious attitude toward the work that is essential to be done. Experience in giving instruction has large value in increasing the importance of obtaining a full mastery of the subjects of study assigned and of keeping in possession for service the knowledge that is gained. A teacher-student learning that this he is to use and that he should in no case forget, and hence he realizes the practical nature of the instruction he receives and he gives devoted attention to both the apprehension and the comprehension of the work pursued.

**Intention to Teach.**—Other conditions of admission are particularly important and are equally essential to the best system of training for the business of teaching. These are such as (1) intention to teach in the schools of the state, (2) intention to complete a course of study in the school, and (3) intention to keep the requirements of the school faithfully and fully. There is a spirit of determination to accomplish something notably good by being somebody exceptionally worthy and capable that has much to do in making the training for the profession all it should be. Many students attend the normal schools for so

short a time, they acquire so little of the spirit there infused, they receive such a small amount of education, that such schools are not responsible for their qualifications or for their suitability. It is such persons as these that depreciate the importance and the reality of normal-school training, because they frequently pose to represent what they are not and could not be.

**Personal Qualities.**—In addition to these enforceable conditions, there are some things that are equally important but not so easily ascertained, yet on them depends after all much that determines the actual quality of a teacher and that makes the training effective. These things are (1) freedom from disease or infirmity that would unfit a person for the office of teacher, (2) a good moral character that establishes the fact that the person will exert a wholesome spiritual influence upon the lives of children, and (3) personal adaptability that must be possessed by nature. The investigation that will determine these things is always uncertain and unreliable, as it depends upon symptoms and sources of information that are often temporary, indeterminate and unreliable.

**Form of Admission.**—There are three forms of admission that are commonly accepted as sufficient, and all of them are in force. They are (1) holding a teacher's certificate or license to teach or experience in teaching of three years' standing, (2) credentials granted by college-entrance examining boards, by state boards of education or by accredited high-school faculties, (3) proofs of scholarship established by an examination equivalent to the requirements adopted by the literary and scientific bodies empowered to grant credentials of admission. Such formal examinations are given by the normal-school faculties.

**Value of Systems.**—Of all these methods of admission the second is so universal that the third is growing to be less and less a method that is essential to the system. In the certificate and credentials system the student is received on trial and given an opportunity to establish the strength of his preparation before being permanently accepted as a student of the normal school. In case students do not show that their training and scholarship are equivalent to the credentials filed, the secondary school and governing board are notified of the failure to meet the standard expected in order to inform them of the results of such student entrance.

**Success of Students.**—In like manner success is always reported and complete information is thus given regarding all beginning students to those responsible for recommending them. Since the formation of the college and secondary school associations of the United States, each state has some system of secondary school inspection in which account is taken of equipment, instruction, management and effectiveness, and thus a standard of uniformity of education and equality of instruction has been secured.

**Requisites Secured.**—There are certain requisites that are fundamental to thorough, efficient, capable teacher training. Among these the more vital to success are the following:

**Spirit.**—The student must be inspired with the spirit of the true teacher, being endowed with an evangelism which enables him to realize that the work assigned him is of permanent and definite importance.

It is absolutely necessary to awaken in him full appreciation of the actual value of the calling to the world. He must feel the claims of service, ardently love his pupils, recognize the mission of uplift and improvement that he undertakes, and labor to secure an inward condition of attitude in his pupils toward the best things in civilization so "that they may have life more abundantly."

**Scope of Work.**—The student must be carefully and sympathetically led through the educational study of the public school in all its phases, in order that he may acquire the teaching process for these ages and thereby become habituated to a condition of mind in reference to all knowledge such that the teaching process becomes to him a natural outcome producing a personal attitude that is harmonious and helpful. It is thus that the normal school becomes professional in its influence and training, conducting the educational study of subjects from the standpoint of the teaching process so that there is produced a broader view of the scope and meaning of training a human soul.

**Study of Man.**—The student must be directed in making a broad, intensive study of what constitutes man, the body, the mind and the soul. This is undertaken to establish clearly the principles of education which underlie all capable and practical instruction. The learning to be a teacher is to acquire a professional attitude and condition, and this training must never degenerate into the qualities of a trade where devices, methods and other mechanical means are considered as training in teaching. The true teacher is a person, not a mechanic; he is an artist, not an artisan; he needs these qualities to work upon the individualities he is aiming to educate, for without them he is incapable for the task imposed.

**Child Nature.**—The student must be given abundant opportunity to develop his understanding of child activities, child development and child life by a practical study of children. He must master the art of interesting them, of managing them and of inspiring them to noble and grand efforts. He must acquire an intelligent conception of the differences that continually exist in pupils that are taught, while through sympathy, suggestion and benevolent supervision he must develop latent power, unknown capabilities and unappreciated values of personality.

**The Relation to the People.**—The normal schools are notable for their being in such close sympathy with the masses. This is due to their province, their patronage, their immediate response to public demand and their recognition of the realities and possibilities of public service from an institutional standpoint. They were founded in direct opposition to the commonly accepted theory of higher education and for that reason they did not receive recognition from other higher institutions of learning without long consideration and discussion. They were accused of not valuing collegiate standards and scholastic ideas and hence a barrier had to pass before their graduates were received at colleges and universities as being possessed of knowledge that was equivalent to that offered by the old standard courses. The progress of elective studies in these colleges, as well as the prominence in public appreciation received by the normal-school graduates for capa-

bility of service and independence of thought and action, finally brought about a great change in the sentiment of college faculties, until to-day these graduates are received with notable favor and consideration by the greater universities.

**Schools of the Masses.**—There is no aristocracy except of character and capability among the student bodies of these normal schools. This is due to the fact that they are largely patronized by the children of the common people. They are obliged to depend upon their own personal endeavors for self-support and they possess a self-reliance and a self-confidence that are of the greatest value. These normal schools are, then, the schools for the masses in general, as they are so organized that any one can enter somewhere in the courses offered for the public service and are diligently trained and thoroughly prepared to do their duty in an admirable and acceptable manner.

**Self-Reliance Obtained.**—The extreme practical nature of these training schools has developed in them an independent, reliant class of workers that has secured for them a popularity and an acceptance by the public that is very exceptional. The rapid development of this kind of education and training in the different states of the Union has been caused by the people as a whole, in order that they may be able to secure more efficiency in their teachers, since experience has shown that these normal schools were definite, positive and immediate in their actual excellence as fitting schools for a notable occupation.

**Popularity of the Work.**—As a consequence, the popular will continues in favor of the expansion of the system of teacher training under public control, and every meeting of every general assembly of every state takes time and opportunity in endeavoring to ascertain in what way the progress of such work can be improved. It is thus that more new institutions are established, that other classes and grades of teacher training are authorized, more progress of work in the older schools is permitted, and the budgets of support are greatly increased, seeking the day when an intelligent, trained, skilled teacher shall be in charge of even the humblest and most remote schools that are found in the rural communities.

**The Expanding Province.**—The province of the normal schools has expanded in harmony with the expansion of the course of study offered by the public schools. It has also been compelled to differentiate its courses to suit the differentiation that has occurred in public school teaching. As teachers became in demand for specialization in definite lines of study and training so the normal school offered special teacher training to suit these particular demands. As teachers' certificates were raised in standard in the several states so the normal school branches of study were modified to suit the new conditions.

**Special Training.**—It is thus that the normal school graduate of to-day is specially prepared to do some specific line of teaching and the general teacher of half a century ago is now not found anywhere except in the ungraded district school, and even there the higher grades of work are rarely found any more, since these schools are now limited to the primary and elementary grades. The consolidation of schools, the introduction of the interurban electric railway, the improvement of transportation and many other causes have contributed to expand the normal school

into an institution where teachers are trained for many special fields of professional work. It is for this reason that the preparation and training of general teachers are not now desirable, since progress has compelled the normal school to reorganize its courses of study and adapt them to modern conditions where the special teacher and the expert are required.

**Modern Notions.**—The normal school of to-day that does not prepare special teachers for the kindergarten, the primary grade, the upper grade work, high school department work, public school music work, manual training, domestic science, physical training, agriculture, domestic art and other particular phases of public education is not a modern school at all and fails to fill the province in teacher training that present-day civilization exacts. Such institutions attempt to follow the law of public demand and do not undertake to decide what should be refused to popular demand and what education is the kind of education that the present civilization needs. They accept the policy that the people of a democracy are capable to decide what they want done and what they are willing to support financially and that it is the chief business of the teacher schools to subordinate themselves to the popular will.

**The Larger Service.**—The normal school of collegiate grade alone can well afford to limit its field of endeavor to the preparation of the kind of teachers needed in village and city school systems and in addition prepare high-school teachers, critic teachers, supervisors of special work, principals and superintendents, as such classes are in great constant demand, but the normal school of secondary grade just as well serves today and generation when it meets the needs of the district schools and trains teachers who are able to prepare the industrial classes for earning better incomes and for the ability to more decidedly enjoy simpler life and purer happiness than would otherwise be possible.

**Modifications in Type.**—The United States covers much latitude and longitude. It possesses great varieties of conditions in public-school requirements and standards. This accounts for the several types of normal schools that have appeared and that are now in existence in the Union. These types may be reduced to five general classes, giving a situation that enables them to be easily understood and comprehended for their individuality. These are the Southern states normal school, the Middle states normal school, the North Central states normal school, the Pacific states normal school and the New England normal school. Each class of these is unique in certain particulars, as it fits its own environment and fills completely the task assigned.

**Vitality.**—These all have shown unusual vitality as educational institutions and have had a marked effect in convincing the colleges and universities that the preparation of public-school teachers was large enough a professional business for them to accept a part of the task imposed. As a consequence there has been a notable change in the last twenty-five years as to policies and plans in the colleges and universities, so that no notable or prominent institution of such class is now conducted without its department or school of education.

**The Courses of Study.**—The preparation of a teacher that is thoroughly adapted to his work requires that he have a working knowledge of the several branches of

study that civilization has adopted as constants in public school education. The normal school recognizes that this selection is very definitely decided, and hence it sets itself to the task of efficiently meeting this requirement. This knowledge of the school courses is assumed to be fundamental and essential to the common life of the people and from that principle the work of teacher education is carefully planned.

**The Way to Teach.**—The normal school undertakes the task of determining the right and best way of teaching these subjects with the use of the least time and effort. It accomplishes the instruction of would-be teachers so as to give them a thorough mastery of the content of the adopted branches of study, while the practical use of this knowledge in the conduct of the school work is also fully realized. It is here that model work as an instructor is attempted to be shown, that definite ideals of educational effort are attempted to be established, that the philosophy of success in instruction is developed and that the spirit of interest is aroused, enlarged, individualized and exemplified. With this interpretation of the object to be attained by normal-school instruction and training the following typical courses are given:

**MINIMUM COURSE.**—Entrance Conditions.—Knowledge of the fundamental branches required by teachers' certificates; arithmetic, English grammar, geography, history of the United States, reading, penmanship, physiology and hygiene, vocal music, orthography, civil government, economics, elementary algebra and elementary physics. These subjects may be certified to by the state examining board or be proven by taking an examination given by the normal school. For students of sufficient age to be teachers these studies are preparatory subjects for the state examination for elementary teachers' certificates but are not a part of the course required for graduation except as they are required for entrance.

**Branches Included in the Minimum Course.**—Three years of work of nine months each, leading to a diploma and a state teacher's certificate.

**MATHEMATICS.**—(1) Algebra. (2) Geometry. **LANGUAGE.**—(1) Latin or German three years. (2) Rhetoric.

**SOCIAL SCIENCE.**—(1) American History. (2) General History. (3) Economics. (4) American Government.

**LITERATURE.**—(1) Folklore and Myth. (2) American Literature. (3) English Literature. **SCIENCE.**—(1) Physics. (2) Botany. (3) Sanitation. (4) Zoology or Geology.

**PHYSICAL EDUCATION.**—(1) Physical Training two years. (2) Lectures on personal hygiene. (3) Games and Playground Work.

**ART.**—(1) Elocution. (2) Drawing. (3) Form, Color and Design.

**ENGLISH LANGUAGE PRACTICE.**—(1) Literary Society work—two years under supervision and criticism. (2) Oratory and Debating. (3) Dramatic Work.

**PROFESSIONAL WORK.**—(1) Psychology. (2) School Management. (3) History of Education. (4) Observation of the public-school work. (5) Teaching in Training School.

**MAXIMUM COURSE.**—Entrance Conditions.—Graduation from a four year accredited high school, inspected and approved by the state as a suitable preparatory school. Credentials received from these accredited high schools on certificate signed by the principal of the high school.

**Branches Included in the Maximum Course.**—Four years of work of nine months each, leading to a degree equivalent to the college degree bachelor of arts, and an honorary first-grade state certificate.

**Required Work for Completing Course.**—1. It is necessary for a student to take as a major study two years of professional instruction in education, which includes psychology, school management, history of education, philosophy of education and American education. This work covers

## HIGHER EDUCATION

### Origin and Purpose.—

The first colleges founded in America, Harvard in 1636, William and Mary in 1693, and Yale in 1701, and, after the lapse of half a century, Princeton and Dartmouth and Brown, were founded with a practical purpose. They were founded to train ministers for the churches of their ecclesiastical order.

### Vocational Training a Constant Purpose.—

This vocational aim has continued, with certain changes. These changes have consisted, first, in the change of the vocation itself, and second, in the substitution or addition of the general purpose of culture or of intellectual training. The clerical aim was maintained till the first decades of the nineteenth century. It was supplanted by the professional purpose of training lawyers, although this purpose never became so consciously dominant as it was in the case of the clerical education. The legal purpose continued up to the later decades of the same century, when it was found that an increasing number of graduates, amounting in the case of some conspicuous colleges to a majority, were entering business. The practical and vocational work of the college education, therefore, has from the beginning been more prominent than is usually thought.

The practical work is also indicated in the changes which have been wrought in the course of study in the progress of two hundred seventy-five years. That course was originally linguistic and philo-epic, consisting largely of Latin, Greek and Hebrew. It was a prolongation of the Oxford and Cambridge tradition. The embellishments of the middle ages, for better or for worse, dominated. The curriculum has, during most three centuries by successive enlargements, come to include almost every intellectual interest. In fact, the history of the curriculum is a history of academic enlargement created by the enlargement of man's knowledge. Scientific studies have been introduced by reason of the demand of the community quite as much as by academic necessities. Economic and social studies have been included as the result of the deepening concern of society in its own fundamental problems. It is significant that the great growth in the instruction offered in the language and literature of Spain followed immediately upon the conclusion of the war of the United States with that nation.

The chief question, however, to be considered is the elements which constitute the practical worth of a college education.

### Develops Power of Thinking.—

A college education broadens, deepens, heightens the power of thinking. This worth is fundamental and comprehensive. The higher education does enlarge the knowledge possessed by the student. But this worth is slight in comparison with the value of the increase of the power of thought. In fact, the process of gaining knowledge is for the student of higher value than the product of the knowledge gained. The knowledge itself vanishes; but the process of accurate,

thorough, comprehensive learning, becoming a part of the student's intellectual equipment, represents a power of thinking of incalculable worth. For the power of thinking stands for reasoning, judgment, the assessment of a fact at a just value, the relation of fact to fact, of truth to truth, and the inferring of new truths and new facts. It stands for the power to unravel a tangled skein of false and true argumentation, the drawing out of the separate threads of a commingled discourse, and the laying of them out in proper order and proportion. It means the appreciation of the great as great, of the small as small, of the lasting as lasting, of the transient as brief, of the limited as narrow, and of the universal as universal. In a word, the power to think means intellectual valuations and appreciation of intellectual relationships.

Now this power has the highest practical worth. It represents the filling of a fundamental need of the American character and of the American community. The new world has, for its dominant characteristic, energy. Its climate or its political conditions or other forces have made the American nation the most energetic nation. But its energy has not been well utilized, its forces have been too largely either wasted or abused. The nation has not been distinguished by its large and sane power of judgment. A proper and practical purpose of the American college should be to make this power of judgment worthy of the new world's energy.

### Promotes Self-Knowledge.—

A practical worth of a college education lies in its power of promoting the self-knowledge of the individual student, with a view of the proper choice on his part of a vocation. A large proportion of men think that they have not chosen a proper calling. Such a mistake results in both unhappiness and inefficiency. A college education prompts a man to defer the choice of a calling to a period later than that at which he would choose a life's calling were he living at the age of eighteen outside college walls. Through the acquiring of knowledge, through an increasing acquaintance with his fellows, through enlarged thoughtfulness on his own part, he comes into more complete obedience to the Greek maxim of knowing himself. Said the graduate of a technical school on the day of his graduation, "I now know that I do not want to be a mechanical engineer. I know I want to be a lawyer." If, however, he had given himself the advantage of a liberal education before taking up the study of a professional education, he would probably have been saved from this waste of time, force, and money. In fact, the higher education gives a man the opportunity of making mistakes which every young man must make in a small area and with slight consequent harm, which otherwise he might make in a large domain and with dire results.

### Promotes Friendship.—

A highly practical value of a college education is also found in its power for making friendships. The power of friendship, as a joy and a personal satisfaction, has been written about since

the time of Cicero and before; but the worth of friendship as a practical concern does represent a great collegiate asset. A man makes more friends and more lasting ones in college than during all his subsequent life. Youth is the time for making friendships—the college age is the age of youth.

Friendship stands for personal intimacy in both process and result—the college place and time are the time and place of intimacy. "In Memoriam" is based upon a college friendship. Lowell's greatest ode gets at least a part of its immortality from the inspiration of college friendships. Now, such friendships promote the forming of relationships of all kinds. Nations trade with nations that are friendly. Individuals do business with individuals that are friends. Men are recommended by and are selected by other men for great places because they are known through friendship. It has been said it is worth while to go to college simply to make friends. In this sense it is a commercial and an industrial value.

### Gives Facility.—

A college education also promotes facility in the individual student. It enlarges his power of doing, and of doing with ease what belongs to him to do. It saves him from the rule of thumb. It delivers him unto the rule of a general principle. It helps him to see what needs to be done in any given case, it helps him to find the force necessary for the doing, it helps him to protect his cause and himself from the necessary perils of his doing, and also helps him to relate properly the consequences of his doing to other forces and conditions. In a very practical way it may at once be said that the higher education increases the earning capacity of each graduate. Given the case of two men, the one entering business immediately on the completion of his high-school course, the other entering business at the completion of his college course. In point of time the high school boy has the start by four years of the college man. The college man begins his life work at practically the very same point where the high school boy began his four years before. But experience proves that when the college man has been at work for two years he will have come up to the high school boy, and in the course of the third year of his apprenticeship he will have passed the high school boy. When once he has passed him, competition has ceased. The college man goes into relationships and developments of his business into which the high school boy cannot, and knows he cannot, enter. One of the greatest retail houses in this country, composed largely of members of the same family, recently entered into an agreement with its own partners that sons and nephews who gave themselves the advantage of a liberal education should receive special advantages and have open to them special opportunities for advancement. Great business men there are who are not college graduates, of course. Nature endowed them with larger powers even without the gift of a liberal education than most men possess. But it is significant that these same men are sending their sons to college, and are doing more to send the sons of other men to college than anybody else in the community.

### Lifts Level of Self-Development.—

Carrying out this same principle of facility it should also be said that education gives a man a higher limit of individual development. It lays the foundation of

his life and character wider and deeper, and it permits a higher and broader superstructure. It is recognized by ethnologists that certain races or tribes more speedily reach the limit of their normal growth than others. The white race prides itself upon its belief that its limit of development is more remote than the limit of other peoples. Education removes limitations. It helps the individual to do more things and each of these things better. It increases general power and thus reinforces special aptitudes. As the physicist often finds he can pursue no further certain researches without greater mathematical knowledge, so the lawyer or the doctor finds that he cannot become a better practitioner without a richer and more simple endowed character. This general endowment enlarges his professional field of service.

**Promotes Higher Service.**—A further element of the practical worth of the higher education, and not entirely unlike that just considered, may be said to lie in the capacity of being inspired to do something worth while. If this capacity exist at all in a man, it is necessary that it should be called out. If it is not called out, it becomes paralyzed or dead. The college is the force and condition best fitted to evoke it into being. College acquaints a man with the great historic movements, political, ecclesiastical, literary. It demands a knowledge of the best books. It might be said that a college is a collection of the best books about the most important subjects. A college represents, too, great teachers and great scholars. In the body of students, moreover, of the college are found souls who, though young in years, are great in radiant hope and promise. Through such forces and conditions the student is inspired to do something worth while, if that capacity exist at all in him. What the greatest have thought of and aspired after, he may think of and aspire after. What the strongest have achieved may be made the not unworthy object of his ambition. Such a coming to one's self is of the highest practical worth. It represents the dawn of a new world.

**Promotes Professional Interests.**—In quite an opposite respect, and one somewhat narrow, college education has special value for the proper entrance upon a profession. Entrance to the clerical profession has usually been conditioned upon being a college graduate. Entrance upon the legal or medical profession has been exceedingly loose. State boards have in most cases admitted candidates to the practice of law or of medicine upon the presentation of an easily obtained certificate of good moral character and upon passing simplest examinations. Law schools and medical schools have required for entrance in most cases knowledge not exceeding that represented in a high-school diploma. But a great change is now occurring. Several medical schools and law schools are requiring at least two years of college work for admission, and those of each type require the B. A., or B. S., degree. The simple fact is that a student cannot enter the best professional schools unless he be a graduate. It is not unfitting to add that such a requirement represents the increased respect which a community is coming to hold for its members, and also represents the increasing power of the community to give a proper pecuniary compensation to those who protect its hygienic and legal rights.

**Develops the Gentleman.**—A further practical advantage of a college education lies in its development of the gentleman. There are graduates who are not gentlemen and there are, many men who are gentlemen who have never passed within college gateways. But a normal result of residence for four years within these gateways is the making of a gentleman. The gentleman represents self-respect without bombastness, an intellect without narrow interpretation of a social condition, a discernment of the duty of putting others before himself, and finding pleasure in such self-negation, and the use of the happy art of giving pleasure to others, whoever, whatever, and wherever they may be. The gentleman represents the man of good manners. Good manners are of a greater consequence in one's career than is usually believed. With them and with other qualities in even a moderate degree one can be assured of a certain kind of success in a career. Without them great qualities and elements of character are vitiated.

Now the college trains the gentleman. The attrition of intimate and long-continued association rubs down the angles of individual idiosyncrasies. The necessity of obedience to formal rules disciplines humility. The presence of worthy examples of gentle manliness among students and teachers and associates prompts the formation of the same great qualities in one's self.

**Trains for Leadership.**—The ninth and last practical advantage of which I shall write lies in a somewhat different field from the advantages already noted. These advantages already noted have largely concerned the individual. The present advantage has special concern for the whole community. I refer to the need of the community of great leadership. Democracies tend to approach to and to rest upon the level of the commonplace. They have to do with the well-being of the great body of the people. They find it difficult to create, to develop, and to train the unusual man.

It is the unusual man, what the naturalists call a "sport," whom a democratic community most urgently needs. It needs sane, large, inspiring leaderships. Such leaderships the college should train. Such leadership means the having of a well-trained brain, of a sympathetic heart, appreciative, firm, loving; of a will, strong, great, guided by a proper intelligence; of a conscience which incarnates righteousness. The college is established to train the brain, to enlarge the heart, to strengthen the will, and to purify the conscience in righteousness. Such leadership the American community has received from college graduates since the foundation of the first college; and to the training of men who embody qualities of such leadership the college is devoting itself with increasing energy and wisdom.

The means which the college uses in securing these great practical results may be summed up in three phrases: truth, men, undergraduate activities.

In this development truth is fundamental. *Veritas* is found upon the shield of the oldest American college; and this word, together with *Lux*, is the word most commonly found upon the shield of American colleges. The book and the lecture are the universal types of truth in literature, truth in science (natural, physical, social), truth in history, in mathematics, and in language, form the study

of the college. Truth is the food of the mind. By its mind is fed, grows, develops. It is the fundamental cause or condition of the practical worth of the higher education.

**Uses Truth and Men.**—With truth is to be united personality. Man makes man. The teacher enlarges, inspires the student more than the text-book. The influence of the teacher over student within and without the classroom is one of the mightiest forces in the American college. There is some reason to believe that it has been a mightier force than it now is. The enlargement of the vast field of truth and the claims of this field upon the student have seemed to limit or to lessen the personal power of the teacher. But it is still recognized that herein lies a rich opportunity for the college professor, if he wishes to avail himself of it. If the student is to get the best results from his college, he should find quickening influences in the person of his intellectual superior.

**Undergraduate Activities.**—A third force which the college uses in securing great practical worth for its education lies in the activities of the undergraduates themselves. These activities have in the last decades become numerous, diverse, and absorbing. In certain larger colleges these activities are represented in no less than a hundred organizations, societies, or clubs. They are social and fraternal, such as the Greek letter societies; they are athletic, such as football clubs, baseball clubs, tennis clubs, shooting clubs; they are musical, such as singing, mandolin, and banjo clubs; they are literary, such as debating and reading clubs. The religious work of the undergraduate represents one of the most important forms of this development.

The Young Men's Christian Association has supplanted the old society of religious inquiry and undertaken to do manifold works for and through its members. These works include, not only welcoming new students, seeking to adjust them to an unknown environment, and trying to aid them in getting the best results out of college life, but also carrying on missions in jails, teaching English to newly arrived foreigners, and even bearing an important part in the manifold and diverse work of a college settlement. In fact, the activities of undergraduates have become so numerous and so compelling that there is some reason to believe that the term student applied to them is a misnomer. But it is certainly true that these activities give an excellent training for a subsequent life of a citizen or a professional. The mercantile or industrial record, for instance, made by many men who played ball in college or who were managers of their teams, gives evidence of the worth of this type of undergraduate training.

**Pecuniary Relations.**—The pecuniary condition attending the college giving and the student receiving such an education is important. The higher education is everywhere a charity or a gift. No student pays for his education. The tuition fee, seldom exceeding \$150 a year, seldom falling below \$50 a year except in the case of some state universities, represents only a share of the entire cost of the education of the individual student. The proportion runs from perhaps one-half to one-quarter. The balance is paid for out of the interest of endowment funds which have usually been the result of either a gift or bequest. In the state universities the balance of cost not paid by the students is met out

of appropriations made by the legislature of the state, which appropriations are usually the result of general taxation. The American community has, either in its organized or in its unorganized capacity, found its advantage in not to charge the whole amount of the cost of higher education to the individuals actually receiving it. It has come to the conclusion, perhaps more unconsciously than consciously, that it will get its pay back in service from the men whom it thus freely educates.

**Promotes Research.**—The practical advantages which have so far been considered as the result of the higher education have related to the training of men. But there are advantages which lie in another plane. These advantages are summed up in the word *research*. The college and university have become in no small sense great research laboratories. These laboratories have devoted themselves to practical concerns. Professor Bell, the inventor of the telephone, said to Helmholtz on the occasion of his visit to America in 1893 that it was the laws which the great German discovered in sound which led to his invention of the telephone. Scientific research in Germany and America has usually been conducted in college laboratories. Scientific research in England has commonly been carried on in private laboratories. Darwin is the striking example, although Kelvin is an example to the contrary. The discovery of the worth of by-products in manufacturing processes is the result, directly or indirectly, of academic research. The value of slag, the worth of certain products formerly wasted in refining oil, in making wood pulp, in making cottonseed oil, has become greater than the original value of the primary products themselves. Mr. Andrew Carnegie has said that his firm was the first to employ a scientific chemist in the manufacture of iron and steel. He thus learned the value of slag. On visiting an iron school, he saw a workman dumping slag upon the waste heap. On inquiry he found that he could buy this slag for a few cents a ton. In Pittsburgh he knew this waste was worth \$10 a ton. The freight and the original cost did not exceed \$2. He said that he was able to carry on this profitable business for a time, but presently the Cleveland manufacturer also became knowing, and then kept the profits

to himself. Such gains have resulted not only in the building up of great individual fortunes, but also in the enlargement of wealth of the whole community. The investigations carried on in college and university laboratories of the sciences and the dissemination of the knowledge of these results among the farmers of Iowa and Illinois are adding each year millions of dollars to the wealth of these and of other states.

**Choice of a College.**—One of the more serious practical questions regarding the college relates to the reasons which should control the choice of a particular college for the individual student. It is to be said, first, that colleges are so unlike that the selection should be made with discrimination. A college fitted for one may be unfit for another; one boy should go to an urban, another to a rural, one to a small, another to a large college. Among the considerations to be weighed in the choice of a place for one's education are:

First, the quality of the instruction. Is the teaching exact, comprehensive, scholarly, inspiring? or is it slovenly, loose, narrow, deadening? Akin to this element, and some would say more important, is the character of the teacher. Is he a large gentleman, noble in manhood, as well as dignified and gracious? Is he a man of the world in the proper sense? Does he take interest in the individual student? does he seek to use the truth and the forces of his teaching in building up the character of each man whom he teaches?

A third consideration in the choice of a college relates to the amount of the instruction provided and to the equipment of laboratories and libraries. Certain colleges are obliged to be content with offering only a few courses of instruction. They are not able, by reason of poverty, to provide more than the primary or introductory courses on the great subjects of knowledge. They are not at all qualified to train scholars. The amount, also, is to be valued. Are there properly furnished laboratories in chemistry, physics, biology and geology? Is that laboratory of laboratories, the library, well endowed? and is its administration effective? Such matters are tests of the worth of a college to the individual student.

The college as a teaching institution is one thing; the college as an institution of research is another; but a college whose

teachers are devoted to research should be the best instrument of teaching. A college whose teachers will not enlarge the bounds of truth is not usually the most efficient force for the formation of character. The scholar on the other side of the institution, as manifested in its power for research, is to be included in the estimate.

It is also to be said that the spirit of the college helps to declare its value. A spirit of superciliousness, of superciliousness, of human remoteness, of indifference to the cardinal virtues and graces in a college—if such an one can be found—should turn the seeking student away from its portals. A spirit of enthusiasm for life, of love for the college, of respect for the highest and the best, of loyalty to the church and its institutions, should attract the student.

In respect to the size of a college, the chief thing to be said is that the large college trains the student more through personality, especially the personality of students themselves. The attrition of living mind on living mind is a mighty force for training character. The small college trains men more through truth, although the characters of the teachers may, in certain instances, become more impressive upon the mind of the student. On this ground, therefore, to some men the large college is of higher worth, and to others the small. In this, as in every other respect, that college is to be selected which will best fit into the needs and hopes of the individual collegian.

**These Advantages Are Common to All Countries.**—It is the purpose of this article to indicate some of the more important practical results of the higher education as it is conducted in America. Similar results in kind are found in other countries. But the practical side of these results is inevitably greater in America than in other countries, although in some older countries the results of these results are considerable worth. They are probably also of more worth, especially as the results of research, in Germany than in England. But everywhere, in countries both old and new, these results are of much value in the proper training of individuals for great human service and in the discovery of truth, which must immediately or ultimately make for the betterment of men.

## DICTIONARY OF EDUCATION AND EDUCATIONAL ETHICS

**Abstract and Concrete.**—These terms have a very important application in many departments of practical education. *Abstract* has reference to general ideas, or the ideas of qualities considered apart from the things to which they belong; *concrete*, to those which are only conceived as belonging to particular objects or substances. Thus, if we speak of a man, a horse, a tree, etc., we use abstract or general ideas; for we are not thinking of any particular object of the class, but only of the assemblage of qualities or characteristics that especially belong to all the members of the class. But when we mention such names as Cicero, Washington, John Smith, etc., we have in our mind a conception of the characteristics that served to distinguish those persons from all other men. Thus, the expression *five pounds* represents a concrete idea; the word *five*, an abstract one.

The immature minds of young children employ to a great extent concrete ideas, and hence the instruction addressed especially to them should deal principally with these. As the mind advances, it becomes more and more occupied with abstract conceptions,

which constitute the material for all the higher forms of thought.

*Academy* is a commonly the name of a pleasure ground near Athens, and was said to be so called after Academus, a local hero at the time of the Trojan war. Its shady walks became a favorite resort for Plato; and as he was accustomed to lecture here to his pupils and friends, the school of philosophers which was founded by him was called the *Academic school*, or merely the *Academy*.

Among the Romans, Cicero, who regarded himself as an adherent of the Academic philosophy, gave the name of Academy to the gymnasium at his villa near Tusculum, as well as to one of his villas in Campania, where he wrote his *Academica Questiones*. During the middle ages, the term was but little used for learned institutions; but, after the revival of classical studies in the fifteenth century, it again became frequent. In a wider sense, it was sometimes applied to higher institutions of learning in general. Gradually, however, its use was, in most countries, restricted to special schools, as academies of mining, of commerce, of forestry, of fine arts,

and, especially, of music. In England and the United States, the national high schools for the education of military and naval officers are called academies. Thus, England has the Naval academy at Portsmouth, and the Royal Military academy at Woolwich; and the United States, the Military academy at West Point, and the Naval academy at Annapolis. In the United States, the name has also been assumed by a large number of secondary schools, which are designed to prepare their pupils for college, to impart a general knowledge of the common and higher branches of education.

The name *academy* is also employed to designate associations of learned men for the advancement of science and art. Some of these associations are of an entirely private character, others have been founded by the state. The first academy of this kind was the Museum of Alexandria, in Egypt, which was founded by Ptolemy Soter. After its model, the Jews, toward the close of the first century of the Christian era, began to establish academies for the development of Talmudic science. Later, the Arabian caliphs established acad-

emies at their places of residence, to show their interest in the promotion of science.

Efforts to establish Christian academies of this kind were made by Gregory the Great and Charlemagne, but both failed. In the middle of the fifteenth century, associations of this kind were formed in Italy for the purpose of fostering the free development of science and art, in opposition to the rigid conservatism of the monastic and ecclesiastical schools. They gave special attention to the cultivation of the Italian language and literature. It was especially the *Accademia della Crusca*, founded at Florence by the poet Grassini, to which the Italian language is indebted for its purification and development. From Italy, these institutions spread to the other countries of Europe; and, as they became the centers of literary activity, they exercised everywhere a prominent influence upon the intellectual progress of the several countries, and especially upon the improvement and regulation of the native tongue. Prominent among these academies was the *Académie Française*, or French Academy, instituted in 1635 by Cardinal Richelieu.

The French Academy is one of five academies, and the most eminent, constituting the Institute of France. It is composed of 40 members, elected for life, after personal application and the submission of the nomination to the head of the state. It meets twice weekly, at the Palace Mazarin, Paris, and is "the highest authority on everything appertaining to the niceties of the French language, to grammar, rhetoric, and poetry, and the publication of the French classics." A chair in the Academy is the highest ambition of most literary Frenchmen.

The other academies of the Institute of France are: The Academy of Inscriptions and Belles-Lettres, with 40 members; Academy of Sciences, with 68 members; Academy of Fine Arts, with 40 members (as follows: Painting, 14; sculpture, 8; architecture, 8; engraving, 4; musical composition, 6); and Academy of Moral and Political Science, with

40 members. All members are elected for life. Like the French Institute, the academies in the capitals of Spain, Portugal, Sweden, Russia, and other countries, have gradually become great national centers for the promotion of science and art; but no such cen-

tralization has been effected in Italy, Germany, England, or the United States. In England, the learned corporations corresponding to the continental academies of science have generally the same society or association.

### The Forty Immortals of the French Academy

YEAR ELECTED	NAME	BORN	PREDCESSOR
1	1870	Emile Olivier	Marseille, 1825
2	1874	Alfred Jean François Mézières	Paris, 1826
3	1868	Gildwin P. de Cléron Comte d'Haussonville	Paris, 1843
4	1868	Jules Arnaud Arènes Claretie	Limoges, 1840
5	1860	Charles Louis de Saulles de Freymont	Paris, 1828
6	1861	Louis Marie Julien Vaucl (Pierre Loti)	Rechofort, 1850
7	1862	Ernest Lavisse	Novion, 1847
8	1863	Paul Louis Thureau-Dangin	Paris, 1837
9	1864	Paul Bourget	Amiens, 1852
10	1864	Henri Houssaye	Paris, 1858
11	1865	Jules Lemaitre	Orleans, 1833
12	1866	Jacques Anatole Talbault (Anatole France)	Paris, 1844
13	1867	Albert Comte de Mun	Lumigny, 1841
14	1867	Gabriel Hanotaux	Beaurevoir, 1833
15	1868	Henri Léon Emile Lavedan	Orleans, 1850
16	1869	Paul Deschanel	Brussels, 1856
17	1860	Paul Hervey	Neuilly, 1857
18	1860	Auguste Emile Augier	Le Rocher, 1847
19	1901	Charles Jean Melchior, Marquis de Vogüé	Paris, 1829
20	1901	Edmond Rostand	Marseille, 1868
21	1903	Félicie Masson	Paris, 1847
22	1903	René Basin	Angers, 1833
23	1903	Etienne Lamy	Clair, 1845
24	1906	Alexandre Félix Joseph Ribot	St. Omer, 1842
25	1906	Maurice Barres	Chartres, 1862
26	1907	Marquis de Ségur	Paris, 1833
27	1907	Maurice Donnay	Paris, 1860
28	1908	Jules Henri Poincaré	Nancy, 1854
29	1908	Jean Richepin	Médan, Algeria, 1848
30	1908	Francis Chateaux	Aurillac, 1848
31	1909	René Doumic	Paris, 1879
32	1909	Jean Alcard	Toulon, 1848
33	1909	Eugene Bréhat	Haley, 1859
34	1910	Raymond Poincaré	Bar-le-Duc, 1860
35	1910	Monsieur Durban	St. Sevan, 1843

### British Learned and Scientific Societies

NAME AND ADDRESS	FOUNDED	OBJECT	NAME AND ADDRESS	FOUNDED	OBJECT	NAME AND ADDRESS	FOUNDED	OBJECT
<b>Aeronautical Society of Great Britain</b> , 53 Victoria Street, S. W., London, N. Afr. S. W., London.	1866	The study and promotion of aeronautics.	<b>Geological Society of Edinburgh</b> , 1 India Buildings, George IV. Bridge, Edinburgh.	1834	The advancement of geology.	<b>Institution of Mining Engineers</b> , 20 Victoria Street, S. W., London.	1859	The advancement and encouragement of the science of mining, metallurgy, engineering, and their allied industries, etc.
<b>Association of Economic Biologists</b> , University, Birmingham.	1904	The promotion of economic biology.	<b>Geological Society of London</b> , Burlington House, Piccadilly, W., London, F. G. R.	1807	The advancement of geology.	<b>Institution of Naval Architects</b> , 3 Adelphi Terrace, W. C., London.	1860	To promote the improvement of ships, and all that specially appertain to them.
<b>British Archaeological Association</b> , 22, Cockspur Street, W., London.	1843	Archæology.	<b>Geologists' Association</b> , University College, W. C., London.	1858	To facilitate the study of geology and its allied sciences.	<b>Iron and Steel Institute</b> , 28 Victoria Street, S. W., London.	1869	The promotion of the iron and steel trades in their practical and scientific aspects.
<b>British Association for the Advancement of Science</b> , Burlington House, W., London.	1831	The promotion of scientific inquiry and research.	<b>Institute of Chemistry of Great Britain and Ireland</b> , 30 Bloomsbury Square, W. C., London.	1877	1. To promote education of persons desirous of becoming professional consulting and analytical chemists, etc. 2. To examine candidates and grant certificates. 3. To elevate the position of chemists.	<b>Linnean Society of London</b> , Burlington House, Piccadilly, W., London, F. L. S.	1788	The study of botany and zoology.
<b>British Astronomical Association</b> , 136 Rodenbush Road, Clapham Park, S. W., London.	1890	Astronomical observation and encouragement of a popular interest in astronomy.	<b>Institution of Civil Engineers</b> , Great George Street, Westminster, S. W., London, F. I. C.	1818	The general advancement of mechanical science.	<b>Marine Biological Association of the United Kingdom</b> , The Laboratory, Citadel Hill, Plymouth, and Marine Biological Laboratory, Lowestoft.	1884	The advancement of British sea fisheries and of marine zoology.
<b>British Ornithologists' Union</b> , 3, Hanover Square, W., London, M. B. O. U.	1858	The advancement of the science of ornithology.	<b>Institution of Electrical Engineers</b> , 92 Victoria Street, Westminster, S. W., London, M. I. E. E.	1871	Telegraphy and electrical science.	<b>Medical Society of London</b> , 11 Chandos Street, W., London.	1773	Medical studies.
<b>Chemical Society of London</b> , Burlington House, W., London, F. C. S.	1841	Advancement of chemical science.	<b>Institution of Mechanical Engineers</b> , Storey's Gate, St. James' Park, S. W., London, M. I. M. E. C. E.	1847	To promote the science and practice of mechanical engineering.	<b>Mineralogical Society</b> , Care of Geological Society, Burlington House, Piccadilly, W., London.	1876	Mineralogy and crystallography.
<b>Civil and Mechanical Engineers' Society</b> , 25 Victoria Street, S. W., London.	1859	The advancement of engineering.			<b>Pharmaceutical Society of Great Britain</b> , 17, Abchurch Lane, E. C., London.	1841	The advancement of pharmacy and allied sciences.	
<b>Entomological Society of London</b> , 11 Chandos Street, W., London.	1833	The study of entomology.						
<b>Folk-Lore Society</b> , 11 Old St., Lincoln's Inn, W. C., London.	1878	The collecting and preservation of relics of folklore.

S.	1804	The advancement of horticulture.	<b>Royal Society of Arts,</b> John Street, Adelphi, W. C., London.	1754	The encouragement of arts, manufactures, and commerce.
<b>Psychical Research, Incorporated Society for,</b> 20, Hanover Square, W., London.	1882	Investigation of psychical phenomena, telepathy, etc.	<b>Royal Institute of British Architects,</b> 9, Conduit Street, W., London. F. R. I. B. A.	1834	The advancement of architectural science.	<b>Royal Society,</b> Burlington House, W., London.	1662	The promotion of natural knowledge.
<b>Royal Agricultural Society of England,</b> 16, Bedford Square, W. C., London.	1838	The practical and scientific advancement of agriculture.	<b>Royal Institute of Public Health,</b> 37, Russell Square, W. C., London.	1886	The advancement of preventive medicine, the study of the public health and the foundation of laboratories for chemical, bacteriological and pathological work and research.	<b>Royal Society of Edinburgh,</b> Princes Street, Edinburgh. F. R. S. E.	1783	Science and polite literature.
<b>Royal Anthropological Institute of Great Britain and Ireland,</b> 3, Hanover Square, W., London.	1871	Anthropology.	<b>Royal Institution of Great Britain,</b> 21, Albemarle Street, W., London.	1799	The promotion of scientific and literary research, and of experimental science.	<b>Society of Antiquaries of London,</b> Burlington House, W., London. F. S. A.	1572 Incor. 1751	Antiquarian study.
<b>Royal Archaeological Institute of Great Britain and Ireland,</b> 20, Hanover Square, W., London.	1835	Study of archaeology.	<b>Royal Meteorological Society,</b> 70, Victoria Street, Westminster, S. W., London. F. R. Met. Soc.	1850	The study of meteorology and climatology, and the promotion of observational work.	<b>Society of Engineers,</b> 17, Victoria Street, S. W., London.	1854	The advancement of the science and practice of engineering.
<b>Royal Asiatic Society,</b> 22, Albemarle Street, W., London. R. A. S.	1823	Oriental research.			<b>Victoria Institute,</b> 8, Adelphi Terrace, W. C., London.	1865	The study of philosophy and sciences, and their bearing upon the teachings of Holy Writ.	
<b>Royal Astronomical Society,</b> Burlington House, W., London. F. R. A. S.	1820	Advancement of astronomy.			<b>Zoological Society of London,</b> 3, Hanover Square, W.	1826	The promotion of zoology and animal physiology.	
<b>Royal Botanical Society,</b> Inner Circle, Regent's Park, N. W., London.	1839	Furtherance of plant study in its scientific and practical aspects, by means of a botanic garden, floral exhibitions, etc.						

## Canadian Societies

Canadian Institute, 68 Richmond Street, Toronto.	1849	Scientific re- search.	Entomological Society of Ontario, Guelph, Ontario. Branches of society in Montreal, Quebec, Toronto, and British Columbia.	1863	To assist and en- courage the study of en- tomology.	Royal Astronomical Society of Canada, 198 College Street, Toronto.	1890	Astronomy, etc.
Chemical Society, McGill University, Montreal.	1902	Discussion of contemporary chemical work.				Royal Society of Can- ada, Ottawa.	1882	The encourag- ment of litera- ture and sci- ences.

## American Societies

American Academy of Natural Sciences, of Philadelphia.	1812	Cultivation of natural sciences.	American Entomological Society, Philadelphia.	1859	The study of insects.	American Mathematical Society, 501 West 114th Street, New York City.	1888	To encourage and maintain an active interest in mathematical science.
American Academy of Medicine, 52 N. 4th Street, Easton, Pa.	1876	To encourage the proper educational preparation of physicians. Study of problems of "social medicine."	American Forestry Association, Washington, D. C.	1882	To encourage protection and proper use of forests.	American Microscopical Society.		To encourage microscopical research.
American Academy of Political and Social Science, University of Pennsylvania, Philadelphia, Pa.	1889	To promote scientific study and investigation of the social sciences.	American Geographical Society, 15 West 84th Street, New York City.	1852	To encourage geographical exploration, and to aid in spreading geographical knowledge.	American Oriental Society, New Haven, Conn.	1842	To promote Oriental scholarship.
American Antiquarian Society.	1812	Collecting and preserving antiquities.	American Institute of Electrical Engineers, 23 West 30th Street, New York.	1884	Advancement of electrical engineering.	American Philosophical Society, Hall No. 104 South 5th Street, Philadelphia.	1743	
American Association for the Advancement of Science, Washington, D. C.	1847		American Library Association, 34 Newbury Street, Boston, Mass.		The promotion of library interests, the interchange of experience and opinion, the advancement of the profession of librarianship in America.	American Psychological Association, 220 College, Northampton, Mass.	1892	To advance the interests of psychology as a science.
American Chemical Society.	1876	Advancement of chemistry and promotion of chemical research.			American Public Health Association.	1872	To advance public hygiene.	
					American Society of Civil Engineers, 220 West 54th Street, New York.	1852	The advancement of engineering knowledge, and the maintenance of a high professional standard.	

## American Societies—Continued

NAME AND ADDRESS	FOUNDED	OBJECT
American Society of Naturalists, Baltimore.	1853	For the exchange of ideas regarding problems of evolution and natural history.
Archaeological Institute of America, Washington, D. C.	1879	To promote and conduct archaeological investigation and research.
Association of Economic Entomologists, Iowa.	1889	To consider work and results pertaining to economic entomology.
Geological Society of America, Museum of Natural History, New York.	1888	For the promotion of geological science.
National Academy of Sciences, Washington.	1863	Two meetings a year, April and November.
National Educational Association, Wisconsin.		To elevate the character and advance the interests of education, to disseminate methods of teaching, and to promote the cause of public education in the United States.
National Geographic Society, Howard Memorial Hall, Washington, D. C.	1888	The increase and diffusion of geographic knowledge.
Naval Architects and Marine Engineers.	1893	To promote practical scientific knowledge in the art of ship-building and marine engineering, etc.
Scientific Alliance of New York, New York City.	1891	To promote the interests of the allied scientific societies which compose it.
Society for the Promotion of Agricultural Science, Urbana, Ill.	1880	To promote the sciences applied in agriculture.

In the United States of America there are also a number of learned societies to which the name *academy*, in the sense used on the continent of Europe, has been applied. **Alexandrian Library.** The largest collection of books of the ancient world, founded by Ptolemy Soter in the city of Alexandria toward the beginning of the third century B. C. At one time it is said to have contained 700,000 manuscripts, embracing the collected literature of Rome, Greece, India, and Egypt. It was partly destroyed by fire by a mob of fanatic Christians in A. D. 391, and was finally dispersed or destroyed during the siege of Alexandria by the Arabs under Amr, A. D. 638.

**Alexandrian School.** A name variously applied, but chiefly designating (1) a school of philosophers at Alexandria in Egypt which is chiefly noted for the development of neoplatonism, and its efforts to harmonize oriental theology with Greek dialects; (2) a school of Christian theologians in the same city which aimed at harmonizing pagan philosophy with Christian theology. The city of Alexandria became, soon after the death of Alexander the Great, by whom it had been founded, a chief seat of science and literature. The time during which the teachers and schools of Alexandria enjoyed a world-wide reputation is called the *Alexandrian age*, and is divided into two periods, the for-

mer embracing the time of the Ptolemies, and extending from 323 to 30 B. C., and the second embracing the time of the Romans, extending from 30 B. C. to 640 A. D. Grammar, poetry, mathematics, and the natural sciences were all taught in the Alexandrian school; and among the most illustrious teachers were Ammonius, Plotinus, Hierocles, Proclus, Apollonius (poet), Galen (physician), Euclid (mathematician), Eratosthenes (astronomer), Ptolemy (geographer). When Christianity began to gain a firm footing, it was found necessary to devote special care to instruction of the catechumens in order to fortify them against the attacks upon Christianity by the pagan philosophers. The catechists not only gave to the candidates for admission into the Christian church elementary instruction, but also delivered learned lectures on Christianity, and combined with it instruction in philosophy. Though, from its original character, the school continued to be called the catechetical school of Alexandria, it was in its subsequent development something very different from a catechetical school, and may rather be regarded as the first theological faculty, or school of scientific theology, in the Christian church in opposition to the pagan philosophers, the teachers of the Christian schools chiefly undertook to show that Christianity is the only true philosophy, and alone can lead to the true *gnosis*, or knowledge. As the first teacher of the Christian theological school Pantaenus (about 180) is mentioned, who was followed by Clement, Origen, Heracles, Dionysius, Pinesus, Theognostus, Serapion, Peter Martyr. The last famous teacher of the school was Didymus the Blind, 335 to 395.

**Alphabet.**—The alphabet of any language is the series of letters, arranged in the customary order, which form the elements of the language when written. The name is derived from the first two letters in the Greek alphabet, which are named *alpha*, *beta*. The letters in the English alphabet have the same forms as those of the Latin language, which were borrowed from the Greek. The Greek alphabet, however, did not contain all the Greek letters. The letters of the Greek alphabet were borrowed from the Phœnician, which was that used by many of the old Semitic nations, and is of unknown origin. It consisted of twenty-two signs, representing consonantal sounds. Into this alphabet the Greeks introduced many modifications and the changes made by the Romans were also considerable. Its use in English presents many variations from its final condition in the Latin language. Thus, I and J, and U and V, instead of being merely graphic variations, were changed so as to represent different sounds, during the sixteenth and seventeenth centuries. W was added previously, in the middle ages. The twenty-six letters of our alphabet have been thus classified with regard to their history: (1) B, D, H, K, L, M, N, P, Q, R, S, T, letters from the Phœnician; (2) A, E, I, O, Z, originally from the Phœnician, but changed by the Greeks; (3) U (same as V), X, invented by the Greeks; (4) C, F, Phœnician letters with changed value; (5) G, of Latin invention; (6) Y, introduced into Latin from the Greek, with changed form; (7) J, Y, graphic Latin form; (8) independent letters; (9) W, a recent addition, formed by doubling U (or V), whence its name.

The imperfections of the English alphabet are manifold: (1) Different consonants are used to represent the same sound; as c (soft) and s (soft) and j, c (hard) and k, q and x. (2) The same letter has different sounds; as g, the same letter, as *g* in *cut* and *cell*, in *get* and *gin*, *s* in *sit* and *as*, *f* in *if* and *of*, etc. (3) The vowels are constantly interchanged, as is illustrated in the subjoined table of the vowel elements of the language and their literal representations.

From this table it will be seen that the letter *a* is used to represent seven different sounds; *a*, five sounds; *o*, six sounds, etc. The names given to the letters are not in conformity with a uniform principle. The letters are, thus, the names of b, c, d, g, p, t, v, and z are *be*, *ce*, *de*, *pe*, etc.; while the names of *f*, *l*, *m*, *n*,

*s*, and *x* are *ef*, *el*, *em*, *en*, etc.; and the names of *j*, *k*, and *z* are, *ka*.

The heterogeneity of these names and of their construction will be obvious. It is important, that the teacher should take cognizance of these incongruities in giving elementary instruction, as they dictate special methods of presentation.

**Analytic Method of Teaching.**—This is the method used by the teacher when he presents to his pupils composite truths or facts, and by means of analysis shows the principles involved, or the mind of the pupil to an analysis of them for himself. In this way he teaches principles which the pupil is to apply to the elucidation of many diverse problems. In the synthetic method, the teacher begins with isolated principles, explains their meaning, and shows how they are to be applied.

Thus, suppose the pupil is to be taught how to add and subtract fractions. According to the analytic method, the fractions to be operated upon are presented to the pupil's mind, and he is shown, first, the difficulty involved, and secondly, how to surmount this difficulty, by (1) finding a common denominator, and (2) by changing the numerators so that the fractions with the common denominator may have the same value as the given fractions. Then the method of addition or subtraction becomes obvious. In this way, learning the principles by analysis, the pupil is enabled to construct a general rule, and apply it to any given case. In the synthetic method, the pupil would be taught, in the first place, the nature and use of a common denominator, then the method of reducing fractions to a common denominator, and then to add or subtract fractions by finding a common denominator. If the object of the instruction is to give the pupil the means to make the pupil expert in adding and subtracting fractions, the analytic method would perhaps have some advantage over the analytic; but, since an important part of this object is to train the mind, the analytic method is greatly to be preferred; for (1) it stimulates the mind to greater activity, (2) it teaches it how to investigate for itself, and to discover truth, and (3) it gives it a much clearer knowledge of the fundamental principles involved in the subject taught.

Whether the analytic method should be employed, and to what extent, is to be determined by a consideration of the subject, the subject taught, and the degree of advancement of the student. In the higher stages of education, much time would be lost by rigorously following this method; and if, in the more elementary stages, the pupil's mind has been thoroughly trained in this way, it will not be necessary to adhere to it when he comes to study the higher branches. At every stage, and in every branch of instruction, however, there will be occasion for the use of both analysis and synthesis; and the skill and judgment of the teacher must be exercised at every step, to determine which is the appropriate method to be employed.

**Arts, Liberal.**—The term *arts*, or *liberal arts*, was, during the middle ages, applied to certain studies which constituted an essential part of a learned education. The full course of study, at that period, embraced "the seven liberal arts," three of which—grammar, logic and rhetoric—composed what was called the *trivium* (the triple way to eloquence); and the remaining four—music, arithmetic, geometry, and astronomy—constituted the *quadrivium* (the fourfold way). The term *liberal arts* is denoted in the universities, those who devoted themselves to philosophy and science

in contradistinction to the faculty of theology, of medicine, or of law. *Master* (*Lat. magister*) was used to designate one who taught the liberal arts; and *doctor*, one who taught or practiced divinity, law or medicine. The first degree (graduate) in the liberal arts, instituted, as it is said, by Gregory IX. about the middle of the thirteenth century, was that of *bachelor* (*Lat. baccalaureus*); and the second title of *master*, which originally conferred the right, and indeed imposed the duty, of teaching one or more of the liberal arts. This title, in many colleges and universities of the United States, England, and France, is now merely honorary.

**Attention** (from the *Latin tendere*, to strain, implying a strained effort of the mind) is perhaps the most important of the mind's activities, since the quality and duration of the intellectual impressions depend upon the degree of attention with which the faculties have been exerted in acquiring them. There is no point of difference between the trained and the untrained intellect so striking as the voluntary power of fixing the mind for a continuous period of time upon any given subject. Hence, to discipline this power becomes, in an especial manner, the office and duty of the educator.

Commencing with the most rudimentary exercise of the observing faculties, he passes on, step by step, to the process by which, through the entire and determined giving up, as it were, of the whole mind to the contemplation and study of any given class of facts or ideas, the student learns to evolve new truths, or analytically to explain the intricacies of obscure problems. When the attention has become obedient to the will, this branch of mental training is complete; and, therefore, the aim of the educator should be to instill habits of controlling the attention, and rapidly preventing those of desultory, wayward application, or listlessness.

This power of continuous attention is, without doubt, the most valuable result of intellectual training. To produce this result is one of the first important duties of the pupils, especially in the earlier stages of instruction. Young minds have an intense desire to know—not words merely, but things. They have a strong craving for facts, and make the deepest enjoyment in the exercise of the perceptive and conceptive faculties. Hence the importance of object-teaching. The perceptive faculties are exercised in the observation of the sensible qualities of all the different things with which the child is surrounded, or which may be presented to its view by the teacher, for the purpose of attracting its attention; and these objects should be diversified as much as possible, so as to appeal to the child's love of novelty.

The attention should not be exercised for long periods of time. When the teacher perceives that it is flagging, it is best to stop the exercise; for all that is done while the child's attention is relaxed is worse than fruitless. It is from inattention to this truth that children are often made incurably listless in school. They are set at work, and their minds, which are awakened no interest in their minds, and, consequently, acquire ineradicable habits of superficial, careless attention. In all the subsequent studies of the pupil it is his duty to keep his interest as awake as much as possible; but it will be found there is a reciprocal action of interest and attention. The pupil having acquired in the first stages, in some degree, the habit of voluntary attention, will, as a matter of duty, apply his mind to the studies prescribed for him; and this very application, if earnest and diligent, will soon excite the dearest interest in the subject of study.

The dependence of memory upon attention is well known to all who have observed, however superficially, the operations of the mind; and the power to recall at will our mental impressions and acquisitions is perhaps directly in proportion to the attention with which the associations binding them together were formed. When these are feeble, loose, accidental, and formed with little volition, the mind will have but an imperfect control of its thoughts, and will thus be wanting in the chief quality of a sound intellectual character.

Attention requires a vigorous exercise of the brain, and, therefore, is more or less dependent upon the physical condition. When this has been exhausted by labor, either bodily or mental, or weakened by disease, attention is feeble and unstable; and the more it is injurious, because it induces still further nervous prostration. Neither should deep attention be exerted or attempted immediately after a hearty meal. The nervous energy thus directed to the digestive functions, which active cerebration will greatly disturb. Hence the diet of a student should be light but nutritious. The brain should also be supplied with thoroughly oxygenated blood. No one can think well in an impure atmosphere, especially if it is contaminated by the breathing of many persons. In this way children often suffer a serious loss of health. They are crowded in apartments too small for the number to be accommodated, and very imperfectly ventilated; and, at the same time, are expected to give close and earnest attention to the subjects of instruction. This is a physical impossibility, and the attempt to do it must always be followed by disastrous results. In no respect has the aphorism, "a weak body is a weak mind," more ready application than to the exercise of attention. For what contrast can be stronger than that presented by the poor wretch whom disease has bereft of every mental state but wandering thoughts or absolute vacuity, and the man of sound health and a well trained mind, who is ready at will to concentrate all his intellectual energies upon a given subject, and to keep them steadily fixed upon it until the object of his investigations has been attained?

**Authority** is the right to command, or the persons or body by whom the right is exercised; sometimes, also, in matters pertaining to the intellect, the power to influence or exact belief. In education, the term has especially this twofold application: (1) to the discipline or management of children; (2) to the instruction of the primary authorities of the child. In the first respect, to which the child is subjected is that of the parent; and for several years no other can be exercised, since the child is not yet of legal age. It is true, the state extends a protecting care over the child; but only by an exercise of its authority over the parents, requiring them to perform their proper duties as the natural guardians of their children. When the parents neglect or repudiate these duties, or are guilty of acts in contravention of them, the state interposes its authority, but not even then directly, upon the child, but only to place it under the authority of those who will better care for its interests, and perform for it the natural duties of its parents. The right exercise of parental authority is, therefore, one of the most important elements in the education of the child.

If the child from its earliest years has been accustomed to recognise and submit to the authority of its parents, firmly but judiciously exercised, no further order will be necessary, on the part of the teacher, in making his authority effective. The child, on entering the school, feels for the first time that it is under an authority different from that of its parents, and to which it has previously been accustomed to submit with unquestioning obedience. Its first impulse is, perhaps, to refuse submission to this new authority; and the influence of the teacher over the child will greatly depend upon the manner in which obedience is enforced. In the authority of the teacher, as well as in that of the parents, two elements are combined—one that attracts and encourages, and one that curbs and subdues. Without the former, authority is arbitrary and violent; without the latter, it is feeble and often powerless.

It is a matter of the utmost importance that all persons concerned in the education of the child should coöperate harmoniously; since nothing tends so much to weaken the force of authority in the mind of the child as to notice a conflict among those to whom control is placed. Father and mother, parent and teacher, teacher and school board, should, at any rate as far as the child is concerned, be absolutely harmonious. The children know of any difference of opinion between their custodians, the more cheerfully

will they respect and submit to the principle of authority in general.

**Bachelor** (*Lat. Baccalaureus*), a term applied to one who has reached a certain grade in a college or university education; as, *Bachelor of Arts* (*A. B.*), *Bachelor of Science* (*B. S.*), *Bachelor of Divinity* (*B. D.*), etc. The word as thus used is of uncertain etymology. It was introduced into the University of Paris by Pope Gregory IX. in the thirteenth century, and was applied as a title to those students who had passed certain preliminary examinations, but were not prepared for admission into the rank of master, teacher, or doctor. Afterward, it was adopted by other European universities, to indicate the lowest academic honor, as it is now used both in this country and in Europe.

**Belles-Lettres** is a French expression for *polite literature*, i. e., books and language in so far as they are shaped by the idea of beauty. It has been used in English to designate a somewhat vague class of studies connected, more or less loosely, with the mastery of literature on its æsthetic side. Some of the colleges in the United States have a professor of *belles-lettres*. He teaches rhetoric and elocution, and the history of literature, and, in addition, criticism, classical philology, the humanities in general, are all in his province.

**Æsthetics** (the science of beauty) and philology have, of late years, made great advance, and new text-books are needed to set forth modern methods of studying literature and language, so as to understand their beauties. The elements of the study should be taught early. In the kindergarten or other infant school, the children should be taught to admire and examine beautiful objects, to notice the qualities which give them beauty, to name the objects and the qualities; they should be told anecdotes in which beautiful persons do beautiful acts, and the words expressive of beauty should be spoken with tones and gestures which may give them lively associations. In the primary school, memory; passages of verse or rhythmical prose in which beautiful thoughts are fittingly expressed, and of which the teacher is fond, should be recited, and the children should be pupils. Such passages may be among the noblest of our literature. It is not necessary that they should be wholly comprehended by the learners. They may be regarded as exercises in learning, and as means of vague intellectual processes, but quickening powerfully the emotional element of æsthetic culture. Language and literature should lead the youth of cultured races to a more rapid development than the natural growth of the understanding. Beautiful and noble words thus learned by heart will serve as models in which the expanding intellect may flow and form. This early oral instruction may be happily aided by learning to read in illustrated books, in which beautiful pictures are made to interpret and enforce the thought.

**Benedictines**, *Schools of the*.—The monastic order founded by St. Benedict of Nursia, at the beginning of the sixth century, occupies a prominent place in the early history of education in Western Europe. The monastic and communal schools could not thrive, at a time when the people at large felt no desire for education, when the number of teachers was so small, and when the few schools that were established, in connection with the parish churches, had to suffer so much from constant wars. The education offered by the Benedictine order was, at first, intended only for boys who were to enter upon a monastic life.

According to the fundamental rule of the order, the separation of the monk from the world should begin as early as possible. Boys called *novices* were admitted when only five years of age. The discipline was strict. The rod was used to punish offences against punctuality and order, and deficiencies in recitation and memory. The most common crimes punished by the scourge, Latin was a prominent part of the instruction, and almost exclusively the language of conversation. Reading, writing, and the singing of psalms were the principal studies, which were supplemented, but the course also included rhetoric, dialectics, arithmetic, astronomy, geography, natu-

ral science, and medicine. Special attention was given to history, as is proved by the numerous annals and chronicles issued from the Benedictine convents.

As few schools outside of the Benedictine convents could be found which offered equal opportunities for the education of children, the monks were more apt to admit boys than boys not devoted to monastic life. These applications came especially from noble and wealthy families, and were so numerous that it was soon found necessary to provide special rooms for the instruction of these boys (*scholas interiores et exteriores*).

The instruction in the elementary branches was imparted by a teacher called *colloquator*; in the larger schools and for higher studies, learned monks, called *magistri*, were appointed, under whose direction other monks, called *revisores*, acted as assistant teachers. With the decay of the Benedictine order these schools declined. Convent education, after the twelfth century, did not retain the ascendancy which it had formerly enjoyed, and where it was possible, passed over to a large extent into the hands of other monastic orders.

**Bible History, or Biblical History.**—The connected history of the events narrated in the Bible is, in many schools, both Protestant and Catholic, a part of the regular religious instruction. The method of teaching it greatly varies according to the age of the pupils. While children of the primary grade are taught only the most salient events of sacred history, in language adapted to their age, more advanced students are introduced into a more full understanding of the Bible. In the compilation of text-books for this study, the authors have sometimes endeavored to give the whole narrative as much as possible in the words of the Bible, so as to make the book, in fact, an abridgment of the Bible. Others have deemed it more profitable to attempt to retain the words of the Bible, and to look, in the first place, to making the subjects as interesting, attractive, and intelligible to children as possible.

Germany, where the Bible history is generally adopted as a part of the course of instruction in public schools of various grades, has a very extensive literature on the subject, including many manuals and text-books. Of scientific theology, Bible history forms an essential part, and is divided, like the Bible itself, into two sections, the history of the Old, and the history of the New Testament. It forms the connecting link between exegetical and historical theology, explaining, on the one hand, the contents of the Bible, and, on the other hand, treating and elucidating them the same as any other historical subject.

**Brain.** the principal organ of the nervous system, and the fountain of nervous energy to the whole body. It is the seat of consciousness, feeling, and intellect, and also the recipient of all impressions made on any part of the nervous system. The brain being the organ especially concerned in education, its hygiene is an important subject for the attention of the teacher.

The development of this organ is very rapid. The average weight of the brain in adults is about forty-eight ounces, and this limit is generally attained at the age of thirteen years. No organ is from the time of birth, so regularly and so incessantly exercised as the brain. During the period of infancy, nature herself superintends this process; and unless her care is interfered with through the ignorance, folly, or neglect of the mother or nurse, it results in a healthy growth and development. When the age of infancy is passed, and the child is surrendered to the educator, intelligence and skill may accomplish much benefit in regulating the cerebral development; or a want of skill and intelligence may do, and often does, very great injury.

Exercise is the natural instrument by which all the bodily organs are brought to a maturity of growth and strength, and by which they are kept in condition of health. In applying this principle to the school, we see that to the exercise be proper (1) as to its kind, (2) as to its degree, (3) as to its direc-

tion; and, in all these respects, that it is adapted to the age and peculiar physical condition of the child, and to the nature of the process which will answer for all. The teacher who wishes to do good, whose aim is really to educate, will study the external indications of temperament, of bodily health, and also of the cerebral structure and will, as far as possible, regulate his operations accordingly. The brain is exercised both by thought and feeling; being the seat of various faculties, both mental and moral, its action is aroused by whatever is addressed to the intellect, the conscience, the emotions, or the propensities. "The first step" toward establishing the regular exercise of the brain is to educate and train the mental faculties in youth; and the second is to place the individual habitually in circumstances demanding the discharge of useful and important duties. The healthy development of the brain may be prevented (1) by wrong exercise, (2) by being overtasked, (3) by bad physical conditions. Overtraining, or too long continued attention; excessive tasks from books, committed to memory under the pressure of fear; long confinement in close rooms, and hence the want of properly oxygenated air, will impair the functions of the brain, and in the long run result not only in future diseases but perhaps of future imbecility. So, too, when subjected to harsh discipline, to unkind treatment, to a moral atmosphere vitiated by the irritability, ill-humor, and moroseness of the parent or teacher, the brain of the child loses even its natural or normal physical condition; and its growth is necessarily morbid.

**Business Colleges.** as now existing in the United States, are the product of individual effort directed to the supplying of a public want. As distinct institutions, they are the outgrowth of the past half century, although schools and private classes for instruction in the commercial branches—particularly bookkeeping and penmanship—have been in vogue for a much longer time. Starting with bookkeeping, penmanship, and arithmetic, the study is now material, algebra, and intensified, and other not less important branches have been added, the purpose and effect of this being to give form and symmetry to the mind, and to meet the increasing demand for broadly educated accountants and clerks. Among the branches which have been added are political economy, including civil government; commercial law; foreign commerce, embracing the elements of English composition and practical grammar; stenography, typewriting, and modern languages, particularly German, French, and Spanish. Some institutions have also made a prominent feature of telegraphy.

But the feature which attracts most attention, both from its novelty and its usefulness, pertains to the practical methods of applying instruction under the guise of real business operations. This plan embraces the organizing of the advanced students into business companies, so adjusted in their workings as to represent the varied interests of business, which exist in the outside world. Thus, certain members are established as merchants, others as agents or brokers, others as manufacturers and exporters, and others as bankers, etc.; each in his turn serving in these several relations, and all together performing the functions of a well-managed business.

Not only is this method carried on in the separate schools, but some of the most prominent among them in the larger cities have established a system of intercommunication by which the work is wisely extended through postal correspondence. Thus representative merchandise is really shipped by the members of one school to those of another, drafts are drawn, remittances made, extensions and business settlements effected, and, in fact, all the minute details of a varied business are carried on. As will be seen, this extended correspondence and cooperation give the best opportunity for the exercise of criticism and discussion, and may be made as completely the rehearsal of the future business man for his life work as is the clinical practice of the medical college or the moot case of the law school.

The American business schools, until recently, have had no public recognition, except

as the result of individual work—with no official supervision to inspire or control their action; and as far as regards their methods and their degrees of excellence as are other purely business enterprises. There is little doubt that they will continue to meet the increasing demand for graduates in their number; they shall become as much a part of our educational system as are the classical and professional schools and colleges, whose purposes and scope are more definitely fixed in the public mind.

**Calisthenics**, a system of physical exercises designed to promote strength and gracefulness of movement; or, by assisting the natural and harmonious development of the muscular system, to improve the health, and add to the beauty of personal appearance. Calisthenic and gymnastic exercises are based on the same principle—that exercise is essential to the proper development of the physical as well as mental faculties, and to the maintenance of their healthy condition; and that, in education, it is requisite that suitable exercises should be systematically employed. The aim of calisthenics and gymnastics consists in the adaptation of the former to the physical education of girls; and, of course, the exercises employed require a less violent muscular action.

The exercises to be practiced with or without apparatus. The latter, which should be employed first, consist in such movements as bring into regular and systematic operation all parts of the body. The movements are neither violent nor complicated, being in fact only such as are required in the ordinary exercise of the limbs. Their advantage over those required in the common active sports of games consists in their systematic regulation so as to insure an equal and regular action of the muscles; while long continued sports of any particular kind, such as tramping, running, and using the skipping-rope, etc., have the reverse effect.

Calisthenic exercises should, however, be so varied as to exhilarate the spirit as well as to relax the muscles; they will lose much of their beneficial effect, unless the body is exercised, the mind must be interested. The simplest apparatus used consists of wands or poles, dumb-bells, back-bands, and horizontal bars, of various weights, etc. With such instruments, a great variety of beneficial, graceful, and interesting exercises can be performed; and when whole classes are exercised, the most favorable results will necessarily be a healthful mental excitement mingled with the physical training, particularly when the movements are regulated by the rhythm of music, which is usually the case in modern schools. The utility of such exercises, when properly and judiciously employed, cannot be doubted, especially after the age of 12 or 14 years, before which they should rarely, if ever, be resorted to.

**Carnegie Institution of Washington.**—A body founded by Andrew Carnegie in 1902 with a gift of \$100,000,000, to which he added \$2,000,000 in 1907, organized under the laws of the District of Columbia, and newly incorporated by Congress in 1904. Its purpose is to "conduct and support many forms of investigation, research, and discovery, and to show the application of knowledge to the improvement of mankind." It is managed by a board of twenty-four trustees who meet annually, its affairs being conducted by an executive committee who act through the president of the institution. The objects of the institution are carried out through grants of money in large and small amounts to persons engaged in special investigations. The president prepares plans and suggestions for the work of the institution and recommends all grants to the board of trustees. The board is required to report the results of their work annually, and these detailed reports, with a general report by the president, are published in the yearbook of the institution. The work falls under four heads: 1. Large projects requiring continuous research during a series of years. 2. Small projects to the number of about 300 now in progress. 3. Tentative investigation carried on by young men and women desiring to pursue special problems for one or two years. 4. Publi-

cation of meritorious works in various fields which would not otherwise be readily printed, and of reports. Of these about forty volumes have been issued.

**Chautauque Institution.**—A system of popular education inaugurated in 1874 by Lewis Miller and Rev. John H. Vincent as the Sunday-School Assembly. The place chosen was on the shores of Chautauque lake in western New York. The first meeting, lasting two weeks, was well attended, and comprised courses of biblical study, a normal department, lectures, and recreation. A novel feature was a relief map of Palestine, 300 feet in length, laid out by the lake. In the following years the development was rapid, sessions were lengthened to two months and courses of study were provided in a large variety of subjects.

As now organized, the institution has schools of English, modern languages, classics, mathematics and science, social sciences, pedagogy, religious teaching, library training, music, fine arts, expression, physical education, domestic science, practical arts, and arts and crafts. Over 200 instructors and lecturers are occupied in the work, which yearly attracts a large body of teachers and adult students. The buildings include residence cottages, gymnasium, and concert and lecture halls of large capacity. The cost of the courses is low and the various forms of entertainment are free to all in attendance, who pay a fee on entering the community.

The class work of the summer sessions is supplemented by the Chautauque Literary and Scientific Circle, a system which consists of the enrollment of readers for four years' course of home study controlled by a committee of the institution. The course includes reading in specified fields in which books, in part prepared for this special purpose, are recommended, and the preparation of written analyses of the work done. Guidance is afforded in the monthly Chautauques. The membership for 1885 was 15,000. Since organization in 1878 about 300,000 persons have pursued the courses in whole or in part. Nearly 200 assemblies, modeled on Chautauques, exist in various parts of the United States.

**Coeeducation of the sexes** denotes the system of educating males and females together, that is, in the same institution, school, or class, pupils of each sex receiving, by means of the same studies and methods, the same school training and culture. This system, in the lower grades of schools, has been almost prevalent in the United States as being the most convenient and economical for small communities.

The alleged benefits arising from it are chiefly the following: (1) Improvement in discipline, the self-will, violence, and rudeness of the boys being restrained by the presence of the girls while the girls' manners are rendered more easy and self-possessed by daily school association with the other sex; (2) improvement in instruction and study, the diversities of the sexes preventing extreme methods, and exclusive, one-sided training and study. Thus, it is said, that the tastes of the boys for severer studies, such as mathematics, are corrected by the inclination

of the girls for the lighter and more sentimental studies, general literature, poetry, etc.; (3) a more sound and healthy development of both sexes; in support of which it is asserted that schools kept exclusively for girls or boys require a much more strict surveillance on the part of the teachers. The girls, confined by themselves, develop the sexual instinct more early, their imagination being the reigning faculty, and not being bridled by intercourse with society in its normal form. So it is with the boys, on the other hand. Socially, isolation in the classroom prevents this tension, and supplies its place by indifference. Each sex, testing its strength with the other, on an intellectual plane, in the presence of the teacher—each one seeing the weakness and strength of the other, learns to esteem what is essential at its true value.

Those who oppose coeducation allege as reasons for their views: (1) That there is need of a better adaptation of instruction and discipline to the peculiarities of the sexes than is possible in mixed schools; (2) that the manners of the girls are unfavorably affected by the constant example of the rougher, coarser conduct of the boys, the latter receiving but little or no benefit from the presence of the girls; and (3) that the moral character of each is liable to be impaired by a premature development of the senses, caused by the contact and constant presence of the other sex. With but few exceptions, these arguments are advanced by those who have only theoretically considered the subject, or by those whose practical experience has been in connection with mixed schools of which the discipline and management were imperfect, thus leading to abuses which, under proper and normal circumstances, would have been eliminated. On the other hand, where there has been a thorough and proper trial of the coeducation of boys and girls, the testimony seems to be strongly, and almost exclusively, favorable to the system.

In Europe, coeducation is generally discouraged; still, the principle seems to be gaining strength, in consequence of the results of the provisions made for the higher education of women.

**College** (Latin *collegium*, originally meaning any kind of association or a name given to large classes of educational institutions, especially in the United States, England, and France. The academic use of the word *college* began about the beginning of the thirteenth century, and originated in the following manner. The students who flocked to the university towns often came into collision with the citizens, and frequent brawls resulted. In order to protect the public peace, as well as to watch over the students, lodging-houses were provided in which the students were under the charge of a superior. These houses were called *colleges*; and this name was afterward applied to any academic institution of a certain grade, whether connected with a university or not. Colleges appear to have first been established in Paris; and soon afterward in Oxford and Cambridge in Bologna and Padua, and in Prague and Vienna. They were richly endowed by popes and other dignitaries of the church,

princes, and powerful families; and, in some of the university towns just named, they became so numerous in the fifteenth century that almost every student of the university, was a member of some one of the colleges.

The American colleges grant degrees in the arts, and give the ordinary course of undergraduate instruction. Many of the older colleges give instruction in theology, law, and medicine, and thus approach to the rank of universities in the European sense of the word. Most of the so-called universities, however, furnish only collegiate instruction; and there is, as yet, no well recognized distinction between the terms *college* and *university* in the United States. About 1900, however, an effort was made toward the standardization of American colleges and universities, which has resulted in placing the following institutions in the ranking group: California, Catholic of America, Chicago, Clark, Columbia, Cornell, Harvard, Illinois, Indiana, Iowa, Johns Hopkins, Kansas, Leland Stanford Jr., Michigan, Minnesota, Missouri, Nebraska, Pennsylvania, Princeton, Virginia, Wisconsin, and Yale.

Institutions of this kind, even, considerably differ in their mode of organization. On the one hand, are those which, adhering to the old system, require no formal admission and a curriculum strictly prescribed; on the other, those which have practically no prescribed curriculum, their course of studies being arranged in schools, among which the student may select at will. Of the former Princeton may be taken as a representative; of the latter, the University of Virginia. Between these two extremes, are those that allow a greater or less freedom of choice to the student. Some, like Harvard and Yale, have distinct scientific departments; others, like Cornell University, have parallel courses, in which greater attention may be paid to science or to modern languages than to the classical course.

Of about 600 institutions in the United States, styled colleges or universities, and possessing the right to confer degrees, a majority have preparatory, and some, inferior departments, which often comprise the greater part of the students. Most of the leading universities have postgraduate courses of study.

The principal degrees conferred are as follows: undergraduate—Bachelor of Arts, of Science, of Philosophy, of Literature, of Letters. The term of study for this degree is, in almost every institution, four years; the method of instruction is ordinarily a combination of lectures, recitations, and written examinations.

The postgraduate degrees are Master of Arts, Doctor of Philosophy, Doctor of Letters, Doctor of Science; professional, Civil Engineer, Mining Engineer, Electrical Engineer, Bachelor of Laws, Master of Laws, Doctor of Laws, Doctor of Civil Law, Bachelor of Divinity, Doctor of Medicine; honorary, Doctor of Divinity, Doctor of Laws. The degree of Master of Arts is frequently conferred as of course upon Bachelors of Arts of three years standing; but, in some institutions, it implies a course of postgraduate study, and it is often honorary.

1890	Agricultural of Utah	Logan, Utah	J. A. Wideson, Ph. D.	State	.....	.....	\$406,611	15	532	16,900
1893	Ag. and Mech. (Color.)	Oreanboro, N. C.	J. B. Dudley, M. A.	State	.....	None	135,000	15	179	1,500
1872	Alabama Poly. Institute	Anniston, Ala.	Levi J. Rowan, M. Sc.	State	Orange and Gold	.....	789,486	67	732	33,000
1871	Alcorn Ag. and Mech.	Chickasaw, Miss.	W. W. Waters, D. D.	State	Yellow and Black	.....	250,000	22	503	2,700
1862	Armour Inst. of Tech.	Chicago, Ill.	C. C. Thack, L. L. D.	Non-sect.	.....	.....	.....	.....	.....	.....
1861	Case School of Ag. Sci.	Cleveland, O.	C. S. Howe, Ph. D.	Non-sect.	Brown and White	.....	3,000,000	37	479	8,000
1896	Clarkson Sch. of Tech.	Potomac, N. Y.	W. S. Aldrich, M. E.	Non-sect.	.....	100	472,221	9	62	3,700
1869	Clemson Agricultural	Clemson Coll., S. C.	Walter M. Riggs, B. Sc.	Non-sect.	Purple and Orange	.....	4,185,201	47	634	29,000
1879	Colorado Agricultural	Fort Collins, Colo.	Charles A. Lowry, M. Sc.	State	.....	None	600,000	75	221	78,000
1874	Colorado Sch. of Mines	Golden, Colo.	V. C. Aldison, Director	State	.....	150	650,000	20	358	10,000
1881	Connecticut Agric. Col.	Storrs, Conn.	C. H. Beach, M. Sc.	State	.....	.....	360,000	25	300	10,750
1884	Georgia Sch. of Tech.	Atlanta, Ga.	K. G. Matheson, L. L. D.	State	.....	.....	600,000	42	362	0
1869	Iowa S. of Ag. and M. A.	Ames, Ia.	Henry J. Waters, B. Sc.	State	.....	.....	2,979,646	171	1,238	27,000
1863	Kansas State Agric. Col.	Manhattan, Kan.	J. K. Patterson, L. L. D.	State	.....	.....	1,815,331	148	2,308	35,000
1862	Kentucky Ag. and M.	Lexington, Ky.	R. W. Silver, L. L. D.	State	.....	.....	468,485	60	681	7,100
1864	Maryland Agricultural	College Park, Md.	J. W. Butterfield, M. A.	State	.....	.....	785,000	40	385	3,000
1863	Massachusetts Agric. Col.	Amherst, Mass.	H. C. McLaughlin, L. L. D.	Non-sect.	Cardinal Red and Silver Gray	.....	4,000,000	154	1,478	78,000
1861	Mass. Inst. of Tech.	Boston, Mass.	.....	.....	.....	.....	700,000	30	245	22,500
1885	Michigan Col. of Mines	Houghton, Mich.	Fred W. McNair, D. Sc.	State	.....	25	1,034,127	113	1,403	81,000
1857	Michigan State Agric.	Lansing, Mich.	J. L. Snyder, Ph. D.	State	Green	.....	1,523,861	26	256	4,000
1880	Miller Manual College	Starkville, Miss.	J. C. Hardy, L. L. D.	City	Maroon and White	.....	855,299	49	650	13,250
1893	Missouri Agricultural	Boonville, Mo.	J. M. Hamilton, M. Sc.	State	.....	30-50	1,189,483	35	348	5,500
1900	Montana S. of Mines	Butte, Mont.	Chas. H. Bowman	State	.....	.....	506,825	47	447	7,850
1895	N. C. of A. and M.	West Raleigh, N. C.	D. H. Hill, Litt. D.	State	.....	45	1,250,000	47	447	7,850
1893	Newark Tech. Sch.	Newark, N. J.	W. D. Gibbs, D. Sc.	State	.....	.....	537,266	40	303	12,300
1899	N. H. of A. and M. A.	Durham, N. H.	W. E. Garrison, Ph. D.	Territory	.....	.....	1,864,252	53	1,083	21,750
1893	N. M. of A. and M. A.	Merilla Park, N. M.	G. R. Wren, L. L. D.	State	.....	.....	80,000	14	250	5,000
1891	N. Y. State Agric. Col.	Fargo, N. D.	G. R. Wren, L. L. D.	State	.....	.....	448,000	42	403	12,000
1873	North Dakota Agric. Col.	Dahlgren, Ga.	W. J. Kerr, D. Sc.	State	Orange	None	850,281	92	1,600	7,250
1873	Ohio Ag. and M.	Columbus, Ohio	W. E. Stone, Ph. D., L. L. D.	State	Old Gold and Black	.....	2,150,000	150	1,094	30,000
1868	Oregon Agricultural Col.	Corvallis, Ore.	.....	.....	Cherry and Cardinal	.....	2,627,351	48	650	8,800
1874	Purdue University	Lafayette, Ind.	.....	.....	White	200	799,000	35	396	9,500
1824	Rensselaer Poly. Inst.	Troy, N. Y.	P. C. Ricketts, C. E.	Non-sect.	Orange and White	.....	1,400,000	21	210	12,000
1890	R. I. of A. and M. A.	Kingston, R. I.	Howard Edwards, L. L. D.	State	.....	.....	614,888	42	626	10,000
1874	Rose Polytechnic Inst.	Terre Haute, Ind.	C. Leo Mees, Ph. D.	Non-sect.	.....	100	246,001	167	1,494	20,000
1841	South Dakota Agric. Col.	Brookings, S. D.	R. L. Slagle, Ph. D.	State	.....	.....	1,800,000	35	396	9,500
1855	S. D. S. of Mines	Rapid City, S. D.	R. L. Fenton, E. M.	State	.....	.....	292,912	40	373	5,400
1871	Sitona Inst. of Tech.	Hoboken, N. J.	A. C. Humphreys, L. L. D.	Non-sect.	Silver Gray and Cardinal	.....	2,466,001	167	1,494	20,000
1876	Texas Agr. and Mech.	College Station, Tex.	R. T. Milner, L. L. D.	State	.....	None	392,912	40	373	5,400
1891	Throop Polytec. Inst.	Pasadena, Cal.	J. A. B. Scherer, L. L. D.	Non-sect.	Black and Gold	.....	20,000,000	110	533	77,000
1881	Tuskegee Institute	Tuskegee, Ala.	B. T. Washington, L. L. D.	Non-sect.	New Blue and Gold	.....	11,000,000	110	780	50,000
1862	U. S. Military Acad.	West Point, N. Y.	Major Gen. Thomas H. Barry	National	.....	.....	784,820	64	502	11,000
1845	U. S. Naval Academy	Annapolis, Md.	Gen. A. S. Superintendent	National	.....	.....	4,910,000	55	1,262	16,800
1873	Virginia Polytechnic	Blacksburg, Va.	Paul B. Barringer, L. L. D.	State	Orange and Black	.....	.....	50	515	13,900
1892	Washington Agric. Col.	Pullman, Wash.	E. A. Bryan, L. L. D.	State	.....	.....	.....	.....	.....	.....
1905	Worcester Poly. Inst.	Worcester, Mass.	E. A. Engler, L. L. D.	Non-sect.	Crimson and Steel Gray	150	.....	.....	.....	.....

## FOREIGN COLLEGES AND UNIVERSITIES

FOUNDED	LOCATION	NAME OF UNIVERSITY	STUDENTS	VOLUMES IN LIBRARY	PARVING LANGUAGE	UNDER WHAT CONTROL

**College Fraternities.**—The college fraternities antedate all secret societies in America except Freemasonry. They reach back to Phi Beta Kappa, founded as a secret literary society at William and Mary College, Williamsburg, Va., Dec. 5, 1776. It was a radical departure from the open or public Latin-named literary or debating clubs which formed so marked a part of American college life in the eighteenth century and during much of the nineteenth century. Its inspiration has never been satisfactory. It is claimed, but with three Greek letters for a name (*Philosophia Beta Khybernetes*) and a secret sign and grip, it became the paragon of its type of American fraternity life in the colleges. In 1831, in response to the anti-Masonry agitation, Phi Beta Kappa abandoned its secret character, and has since then spread to a large number of American collegiate institutions, where membership in it for many years has been merely an indication of high scholarship attained.

Rituals of college fraternities did not amount to much prior to 1831, when the anti-Masonic agitation had had time to exploit the subject. Beginning with the revival in general secret-society life, which came as the reverse movement of that pendulum, the Greek-letter fraternities absorbed into the fabrics of their ceremonials much that is Masonic, the David and Jonathan, the Skull and Hood, and Druidic and chivalric legends, in some instances with a skill which not infrequently betrayed the work of a master hand.

It should be noted that among the larger universities Princeton is the only one at which there are no Greek-letter fraternities. At Yale the secret-society system differs from that at almost every other like institution, with local fraternities of its own for sophomores and for seniors (the latter Skull and Bones, Scroll and Key, Wolf's Head, and the new Elhiu Club), and the three historic Greek-letter societies, Alpha Delta Phi, Psi Upsilon, and Delta Kappa Epsilon, as the junior year stepping-stones to "Bones," "Keys," Wolf's Head, and Elhiu.

A reference to catalogues of these associations reveals the names of nearly 140,000 members, living and dead, who, during the greater portion of the last 100 years, in many instances have been prominent in professional, political, or business life.

Emulation, imitation, and a natural rivalry led to the formation of succeeding Greek-letter fraternities, the better known in the general list being given in the appended table:

## General Fraternities

FRATERNITY	MEMBERSHIP	ACTIVE CHAPTERS	INACTIVE CHAPTERS	NO. HOUSES	WHERE AND WHEN FOUNDED
Alpha Chi Rho	490	11	1	11	Trinity, 1895.
Alpha Delta Phi	11,274	23	6	23	Hamilton, 1832.
Alpha Tau Omega	7,850	59	45	23	Virginia Military Institute, 1865.
Beta Theta Phi	15,698	70	20	59	Miami, 1839.
Chi Phi	5,193	18	10	30	Princeton, 1824.
Chi Psi	4,890	18	12	17	Union, 1841.
Delta Kappa Epsilon	10,000	11	11	23	Yale, 1844.
Delta Phi	3,600	11	0	11	Yale, 1827.
Delta Psi	2,500	8	0	8	College, 1847.
Delta Sigma Phi	715	8	1	4	College, City of New York, 1901.
Delta Tau Delta	9,875	32	26	12	Bethany, 1859.
Delta Upsilon	10,000	38	4	36	Williams, 1834.
Kappa Alpha (North)	1,100	10	10	10	Union, 1825.
Kappa Alpha (South)	9,280	48	10	30	Washington and Lee, 1865.
Kappa Sigma	9,037	73	17	48	University of Virginia, 1869.
Omega Psi Alpha	312	6	0	5	College, City of New York, 1901.
Phi Delta Theta	16,460	71	24	69	Miami, 1848.
Phi Gamma Delta	10,500	57	25	45	Washington and Jefferson, 1848.
Phi Kappa Psi	10,500	43	20	31	Washington and Jefferson, 1852.
Phi Kappa Sigma	3,900	26	14	20	University of Pennsylvania, 1850.
Pi Sigma Kappa	3,000	23	0	23	Massachusetts Agricultural College, 1873.
Pi Kappa Alpha	5,000	30	6	10	University of Virginia, 1868.
Psi Upsilon	11,200	22	1	21	Union, 1833.
Sigma Alpha Epsilon	12,000	71	27	54	University of Alabama, 1856.
Sigma Chi	7,280	37	18	51	Miami, 1855.
Sigma Nu	8,000	59	14	48	Virginia Military Institute, 1869.
Sigma Phi	1,425	9	2	8	Union, 1827.
Sigma Phi Epsilon	1,060	24	6	13	Richmond College, 1901.
Sigma Psi	495	7	5	3	William & Mary, 1732.
Theta Chi	500	4	0	4	Norwich University, 1856.
Theta Delta Chi	5,000	26	16	19	Union, 1848.
Theta Xi (Eng. Sci.)	960	11	0	10	Reinhardt Polytechnic Inst., 1864.
Zeta Psi	5,500	22	9	15	New York University, 1847.
Total	215,494	1,054	356	801

**Commencement** denotes, in the United States, the occasion on which degrees are conferred by colleges and universities upon their graduates. This takes place in June or July, and closes the scholastic year, so that the name in this respect appears to be a misnomer. The exercises connected with the commencement sometimes begin on Sunday with a commencement sermon to the graduating class. On the two or three following days, the literary societies among the students hold their annual meetings, and exercises are delivered before the societies and before the alumni association. A general reunion of the alumni of previous years is held, and, frequently, also the graduates of a particular class hold, by appointment, a special reunion. The board of trustees also holds its annual meeting, receives the report of the president of the institution for the past year, and makes the necessary regulations for the year ensuing. All these transactions precede "commencement day," on which the president of the institution, in the presence of the board of trustees, the faculty, and as many friends and visitors as the occasion may bring together, confers upon the graduates the degrees for which their special studies and examinations have prepared them. The conferring of the degrees is preceded by orations delivered by the members of the graduating class, the "valedictory" and "salutatory" addresses being assigned to the scholars holding the highest rank in the class. The Latin language is frequently used by the "salutatory" speaker, as well as by the president in conferring the degrees.

**Convent Schools.**—Convent school education is based on the principle that religion should have a predominating influence in the education of the child, and that a complete retirement from the world is conducive to the formation of a Christian character. The features which distinguish them as a class from other schools consist chiefly in the peculiar methods of their management and administration.

The course of instruction presents no marked points of difference from that pursued in other schools of the same grade comprising, in England and the United States, as the prospectus of these institutions generally informs the public, "all the usual branches of a sound English education," with French, to which a greater prominence is given than in the majority of other schools. Instrumental and vocal music, and drawing are carefully attended to as necessary accomplishments; and, in many institutions, the pupils have also the "advantage of the best masters for dancing."

The superior of each of these schools is expected to exercise special care in the supervision of the department of the pupils, and the greatest possible attention is given to their religious and moral training. The religious atmosphere in which the students live, and the frequency of the devotional exercises, interwoven with the studies, are calculated to produce profound and lasting impressions.

**Cooper Union, or Cooper Institute.**—An institute founded in New York City in 1857, by Peter Cooper. Its object is to provide free schools of art and science, and free read-

ing rooms and library for the working classes. There are lecture courses, a museum, an art gallery, and a library of 31,000 volumes, with a reading room containing current numbers of nearly 50 magazines and newspapers. The institute was built at a cost of \$650,000, and was endowed by Mr. Cooper with \$300,000. It has received additional gifts from time to time from Edward Cooper and Abram S. Hewitt, and in 1899 Andrew Carnegie gave it \$300,000 for the founding of a mechanical day art school.

**Corporal Punishment,** or the infliction of physical pain as a means of discipline in the education of children, has the sanction of high authority and has been common from all times, but in recent times has fallen considerably into disrepute and disuse. Its necessity and propriety have been much discussed; and there are, probably, but few subjects in connection with practical education upon which more diverse opinions are entertained. Some contend that a resort to corporal punishment, in families and schools, is legitimate and necessary; others, that it is a "reluctant barbarism," and should never be employed, but that children can be, and always should be, governed by the use of "moral suasion," an appeal to their reason, and to their conscience, and their sense of right. Antiently, the propriety of this mode of educational coercion seems to have been scarcely questioned.

In judging of its necessity, we are to consider (1) the nature of the child to be governed, (2) the circumstances under which school or family discipline is to be carried on, and (3) the agents by whom the child is to be instructed and controlled. All sentimentalism is, of course, to be eliminated, and the facts of experience alone are to be appealed to. We must take human nature as it is, and not as we would wish it to be. We must consider the selfishness, willfulness, idleness, and spirit of mischief that must be controlled or exorcised before instruction can accomplish its purpose; and before concluding that corporal punishment is never necessary, we must be prepared to show that under all circumstances, and with all available instrumentalities, this control can be effected without any appeal to physical coercion.

As to the offenses for which corporal punishment should be inflicted, and the proper mode of inflicting it, the following suggestions (of a practical teacher) would probably meet with universal approval from those who claim that this mode of discipline is, in certain cases, indispensable: (1) It should be reserved for the baser faults. A child should never be struck for inadvertencies, for faults of forgetfulness, for irritability and carelessness, or for petty irregularities. It is a coarse remedy, and should be employed upon the coarse sins of our animal nature. (2) When employed at all, it should be administered in strong doses. The whole system of slaps, pinches, snappings, and irritating blows, is to be condemned. These petty disciplines tend to stir up anger, and excite the child to retaliate, and thus subdue it. (3) In administering physical punishment to a child, the hand should be left sacred from all violence. Pulling the hair or the ears, rapping the head with a tumbler or with the knuckles, boxing the ears, slapping the cheeks or the mouth, are all brutal expedients. These irritating and annoying practices are more likely to arouse malignant passions than to subdue them. (4) The temper with which you administer punishment will, generally, excite in the child a corresponding feeling. If you bring anger, you will be excited; if you bring affection and sorrow, you will find the child responding in sorrowful feelings; if you bring moral feelings, the child's conscience will be excited; if you bring anger, you will destroy all the benefit of punishment; love and firmness will, if anything can, work penitence and a change of conduct.

**Correspondence Schools.**—The system of instruction by correspondence is a noteworthy feature of modern education. It originated at Newham College, Cambridge, England, and, in the United States, was

inaugurated through the Chautauqua Literary and Scientific Circle in 1878.

The method which has brought the system to its present state of perfection is this: When once the subjects of work are selected by the student a number of questions are sent out bearing upon his present efficiency and future needs; a student is then called a "test-paper" is sent to sound his educational standard, and a number of directions as to the precise line of work he is to follow. A series of questions are sent out, and a course of study are sent and received periodically by instructor and pupil, the answers being duly commented upon, corrected, and returned, together with numerous hints and notes. The student is further advised as to the best books, as to special points of weakness in his work; and he learns to condense his thoughts by *continually writing out his answers*, and this latter is the keynote of all correspondence institutions. Not infrequently books are loaned, and the instructor, being generally fully acquainted with the newest and best methods of educational work, is able to afford valuable assistance to isolated students. Further, sympathy is afforded, which is a strong incentive to the solitary worker, and a ready referee is always at hand to solve difficulties and give encouragement in those times of depression too well known to solitary students.

In many correspondence classes excellent lectures are from time to time sent, and annotated books of reference, notes on syntax, grammar, and construction, quotations, problems fully worked out, which serve as examples; and students thus benefited by the research of men and women who have access to fuller sources of information than they themselves possess.

The success of the Chautauqua system led to the establishment of similar courses in various parts of the country, as adjuncts to regular residence courses, and eventually to the founding of correspondence schools devoted exclusively to this form of education, either on general or special lines. One of the chief developments of the principle is, however, as an element in university extension. Correspondence classes now form a regular part of the course in a number of educational institutions, as the University of Chicago, Armour Institute, and others. Formal courses are designed to be equivalent to corresponding residence courses and are counted in whole or part toward the degree. One of the chief institutions of the kind is the University Correspondence College, of London, England, which prepares specially for London University degrees. There are many privately conducted correspondence schools of varying degrees of merit.

**Cramming**, a term used in regard to education, to denote the fault of filling the mind with facts, without allowing it sufficient time to arrange and generalize them, to compare them with its previous acquisitions, or to determine their real significance as related to general principles. It is thus a kind of mental stuffing, and, consequently, is opposed to the true object of education, which, as the word etymologically considered implies, is not to put something into the mind, but to bring it out by appropriate exercise, its latent faculties. In college phrase, students are said to *cram* for an examination, when they make preparation with undue haste, impressing upon their memory, by repetition, a mass of things about which they expect to be questioned, but which, when the examination is over, they immediately forget. Such a process is exceedingly injurious to the mind, since it is a misdirection of its powers, wasting them at a time when they should be all steadily employed in the formation of those habits of acquisition and thought which constitute the basis of a sound intellectual character.

In elementary education, cramming is, therefore, especially pernicious; and it is at this stage that it is the most likely to occur. It may assume two forms, but chiefly the following: (1) Crowding the memory with verbal formulae—definitions, rules, statements of facts, names in geography, dates in history, etc.; (2) overtasking the

powers of the mind with a multiplicity of studies, or with such as are not adapted to its immature condition, and, therefore, cannot be comprehended; (3) undue haste in instruction, so that the pupils are compelled to commit to memory what they have had no time properly to digest in their minds.

Cramming may be the result either of the ignorance of the teacher, or of circumstances which compel him to violate the correct principles of education for some special end, as the preparation of pupils for public exhibition, in which they may make an imposing display of their superficial acquirements. Such a perversion of the teacher's work is this implies is of too frequent occurrence; for parents and patrons are too fond of witnessing such displays, and there are teachers whose eagerness for praise or patronage is sufficient to overcome their sense of the true object of their vocation. They seem to work more for their own petty ambition or pecuniary gain than for the true welfare of their pupils. The evil of this is not alone with the pupil, but is shared by the teacher himself; for by merely cramming the minds which it is his duty to educate, he fails to realize in himself the best results of giving instruction; since, while he is endeavoring to get acquaintance with the growth of his pupils' minds, he may also have the higher satisfaction of feeling the growth of his own.

**Deaf Mutes.**—The first regular instructor of the deaf and dumb was Pedro Ponce de Leon (1520-54), a Spaniard, who taught several deaf-mutes to speak, read, write, and cipher. The first extant work on the education of the deaf was written by Juan Pablo Bonet, and published in 1620.

In the instruction of the deaf and dumb there are three principal methods—the oral, the sign and manual, and the combined method.

With the oral method the deaf are instructed by and through speech. All signs except purely natural signs are discarded. The pupils are taught to pronounce the elemental sounds of the language singly and in combination, and to recognise their forms on the lips; to write, and to associate with these sounds and lip-movements the characters which represent them. As soon as the pupil can pronounce a word correctly, the scholar is taught the meaning of it. When he can say *ball*, a ball is shown to him, the connection being thus established in his mind.

To learn to articulate the sounds and combinations of the English language is a matter of some difficulty for the deaf child; to master the grammatical intricacies of our language is much more difficult. Though a bright child will learn to read and pronounce easy words in from six to twelve months, it takes eight or ten years to bring him a knowledge of the language equal to that which the average hearing child of seven or eight possesses.

Many teachers prefer the sign and manual method. Deaf-mutes are natural mimics, and, when thrown into one another's society, they grow up and learn to use many signs—at first purely mimetic, but gradually becoming conventionalized, and therefore capable of expressing abstract thought. This language of the body, or, as it is called, natural language, is often called by the deaf their mother-tongue, and most of them prefer it to acquired speech or writing as a medium for the expression of their thoughts. It must not be supposed that writing or grammar is neglected by teachers who follow this method. The language in its written form is taught from the first; finger-spelling, which is simply writing in the air, is used to save time; signs are used to explain matters which as yet cannot be explained to the pupil in words.

In schools where the combined method is adopted, speech, lip-reading, writing, finger-spelling, and signs are used in varying proportions, according to the judgment and discretion of the teacher. In 1848 A. Melville, a British writer, first introduced it at Edinburgh, introduced the method of teaching articulation by *visible speech*. The school of Great Britain began to use it in 1869, and in 1872 it was introduced into the

celebrated Clarke school at Northampton, Mass., by A. Graham Bell, son of the inventor of the telephone, comprising a series of phonetic characters based on the position of the vocal organs when in action. The characters suggest to the eye the mechanism of speech in the formation of every possible sound that can be uttered by man.

**Debating** is often employed as an exercise in schools for young men (and sometimes in those for the other sex), in order to afford a means for practice in extemporaneous speaking, and in increasing the power of investigation of subjects of scholastic or general interest. When so used, it should be carefully regulated, both as to the questions selected for discussion, and the method in which the debates are conducted. The usual rules of debate should be strictly enforced, and the participants confined to the exact subject considered, and required to use language of undoubted propriety. The rules of parliamentary debate may be made a subject of formal study auxiliary to the practice of debating, and, in this way, the students partly prepared for discussion, and the improvement in their connected with college have usually been considered a very important source of practical culture.

**Declaration**, or the formal delivery of set speeches, is another piece of culture, is of considerable importance, when conducted in a proper manner and with due regard to its special uses and limitations. The objects chiefly to be gained by exercises of this kind are the following: (1) The training and culture of the voice; (2) practice in elocution; (3) the habit of speaking in public with confidence, ease, and grace; (4) the cultivation of a taste for public speaking; (5) an improvement in the pupil's style of composition. In the education of boys and young men particularly, these are all points of great importance, inasmuch as the ability to speak effectively in public is of great value.

The following points should be carefully attended to in giving elementary instruction in declamation: (1) The piece to be declaimed should be selected with care, and the language, but in regard to the thoughts, emotions, reasoning, etc., which it may involve, and the circumstances under which it was originally spoken, as well as the character of the speaker. (2) minute, rudimentary criticism should be rendered unnecessary by sufficient preliminary training in enunciation and other departments of elocution, as well as in the use of gesture; (3) the various kinds of gestures having been taught, the pupil should be allowed great freedom in respect to their use; (4) the spirit, and not simply the form, should be thoroughly aimed at in the instruction; and no piece should be assigned to a pupil to speak which is beyond his capacity to understand and appreciate.

Even the pupils of elementary schools may be benefited by appropriate exercises in recitation and declamation; thus, the speaking of easy and interesting dialogues by two or more children will be found one of the best methods to impart to young pupils a practical acquaintance with the principles of declamation, besides cultivating a natural style of speaking.

**Dictation**, a school exercise in which the teacher reads or speaks (dictates) to the pupils what they are to write, is practised in writing, spelling, etc. Such exercises are very useful, not only to give accuracy and expertness in writing words and sentences, but to train the ear to the correct apprehension of spoken language. In this respect, it supplements copying, which exclusively disciplines the eye.

**Didactics**, the theory of instruction, as distinguished from that of education in its narrow sense, implying merely moral culture. It is commonly treated under two heads: 1. *General didactics*, which exhibits the philosophical principles of teaching, and the conditions, or *methodics*, which applies the general truths to the several branches of instruction, the different ages to be instructed, and the various individual characters and their treatment. The distinction between didactics and

pedagogy in the narrower sense is made only for the sake of separate scientific treatment, as it is universally conceded that all instruction can be rendered a means of moral education, and that no instruction deserves the name, or can be truly successful, without a corresponding development of moral power. In any branch of instruction, the teacher is being pressed into action, not on the part of the pupil, while the progress made will depend on his self-activity, and his ultimate mastery on his full appropriation of the knowledge. Power is not in the branch of art or science concerned. On the part of the teacher, moral power, engendered by such mastery, must be presupposed, if he is to impart to his pupil attention, self-activity, and love for the subject.

In regard to the age of the pupil, instruction and moral education bear to each other a changing proportion. During the first age, from earliest infancy up to the eighth or tenth year, the so-called *formal purpose* of education prevails in importance; the several functions of the youthful mind must be made self-active, and the material purpose of didactics, the acquisition of knowledge or positive learning, must be made a mere means to the former, so that the child may concentrate circles of facts be given to appropriate them as can be digested for the benefit of each function. The second age, which extends to the beginning of sexual maturity, is the one during which instruction and education should be, as it were, in equipoise; while, in the period after sexual maturity, the material purpose, that of the acquisition of knowledge and skill, may preponderate.

**Discipline** in its wider sense means the whole system of instruction to which the learner or disciple is subjected, and is thus almost interchangeable with the term "education," and "education." In its narrower sense discipline refers to the maintenance of authority. The system of school government, with its definite rules, its punishments, and its rewards, is a condition of systematic teaching, and so may be viewed as subserving the end of intellectual instruction. At the same time it is evident that authority, as the power to work through the agency of the child's will. In this way discipline comes to have a special connection with the exercise and formation of the will—in other words, with what we mark off as moral education.

The imposition of commands, by exercising the child in self-restraint and by inducing a habit of obedience, is the great means by which the early training of the will is effected, and the foundations of moral habit and good character established. The merits of any system of discipline must be tested by the measure in which it attains its ends, intellectual and moral.

The general conditions of an effective discipline are such as follow: (1) The rules laid down to be intelligible and to be uniformly enforced; (2) the rules to be as few as possible compatible with the securing of the necessary objects; (3) the avoidance of any such things as capriciousness and unfairness in the application of the rules to individual cases; (4) the recommendation of the rules laid down by first calling forth the child's feelings of respect and confidence in his ruler, and afterward, as he advances in years, gradually enlisting his intelligent approval and support. An important part of the theory of discipline concerns itself with the subject of punishments and rewards.

**Drill**, a term used to denote the strict routine of exercises required either to train pupils to the ready performance of mental or physical processes, or to impress upon their memory their arbitrary associations of facts or words which are required in many subjects of study. Thus, a certain amount of drill is required in teaching the arithmetic table, the paradigms and rules of grammar, the spelling of words, and those facts of geography that pertain to the location of places (memorizing maps). Drill requires definite exercises, and the practice in them, continued a sufficient length of time, in order to impart a kind of automatic force to the recollection. Both mind and body, by repetition, acquire definite attitudes by means of which thought and muscular

action may be accommodated to the performance of acts which at first might have seemed impossible. This is the foundation principle of drill.

**Duty** is that which we ought, or are under moral obligation, to do. The term duty thus presupposes a moral law which demands our obedience. With this abstract concept of duty, ethical writers give us a scheme of particular duties, as (1) duties to others, (2) to ourselves, (3) to God. It is evident that the child can only reach so abstract a conception as that of duty slowly, and as the result of experience and reflection. The first crude idea of duty or obligation is acquired by help of positive commands laid down and enforced by others, or by the authority of authority. *Oughtness* at first means what some one in authority bids me do. As with a community so with a child, the sphere of duty is largely determined by custom. What the child is accustomed to do and to see others do, that tends to become a matter of duty or obligation.

**Education** is the science and art of human development and deals with the training of the bodily organs, the senses, and the intellectual and emotional powers, with a view to the securing of the happiness of the individual and the well-being of the society or the state of which he is a unit.

Education may be divided into several departments, according to the nature of the material or subject-matter, and improvement of which it is directed, including (1) *physical education*, or the education of the bodily powers; (2) *intellectual education*, of the mind or intellect; (3) *moral education*, of the propensities, sentiments, will, and conscience; (4) *aesthetic education*, of the taste, musical, artistic, or literary, that is, depending on the sphere of the imagination; and (5) *religious or spiritual education*, of the religious sentiments, the spiritual instincts, that is, those which concern only the soul as a spiritual and immortal essence, and its relations to the Creator, the Infinite Spirit.

Education is also distinguished into *home or domestic education*, and *public or common-school education*, or considered as a means for the general enlightenment of the people, *popular education*; also into *private education*, that is, supported by private funds, and *national education*, maintained by the state.

Education must be distinguished from instruction, which is simply the communication of knowledge for a specific purpose. Education is subjective, instruction objective, but the aims of both may be identical, as when the communication of knowledge involves the development of faculty. In the limitation of its meaning to the work of the schools education is synonymous with pedagogy.

**School education**, generally called instruction, on account of the more limited character of its scope and the sphere of its application, is distinguished according to its grade, into (1) *primary instruction*, that is, the instruction given in elementary schools (such as the common schools, the primary grades of the high schools, or the lower subdivision of primary instruction); (2) *secondary instruction*, as given in academies, high schools (middle schools); (3) *higher instruction*, as given in colleges and universities; (4) *special instruction*, as of the blind, the deaf and dumb, and the imbecile; (5) *professional and technical instruction*, as in art schools, medical schools, military, naval or nautical schools, theological seminaries, schools of architecture, etc., for information in regard to which see the respective titles. The following outline indicates the chief branches of education and their principal subdivisions:

**FIRST ARTS:** Architecture; Drawing; Music; Painting; Sculpture.

**HISTORY:** Grammar; Orthography; Philology; Rhetoric; Writing.

**LITERATURE:**

**Mathematics:** Algebra; Arithmetic; Bookkeeping;

**Calculus:** Geometry; Navigation; Quaternions;

**Surveying:** Trigonometry.

**Medicine:** Anatomy; Dentistry; Dermatology;

**Mineralogy:** Gynecology; Hygiene; Laryngology;

**Metaphysics:** Ontology; Epistemology; Ophthalmology; Otorhinology; Otolaryngology; Pathology; Pediatrics; Psychiatry; Surgery; Therapeutics.

**Philosophy:** Aesthetics; Cosmology; Ethics; Logic; Metaphysics; Pedagogy; Psychology.

**Political Science:** Diplomacy; Finance; Government;

**Religion:** Theology; Archaeology; Astronomy;

**Science:** Chemistry; Geography; Geology; Mechanics;

**Metallurgy:** Meteorology; Mineralogy; Physiology;

**Physical Science:** Anthropology; Bacteriology;

**Biological Science:** Biology; Botany; Zoology;

**Physiology:** Ethnology; Histology; Ichthyology; Physiology;

asmuch as they definitely recognise and reward superiority or excellence.

Naturally, children are but little prone to study, their fondness being rather for active sports and amusements; and hence, the awakening of an interest in the studies themselves, while an important object of the teacher's efforts, cannot be depended upon to incite the pupil to continuous industry. While there are some minds and temperaments that feel an almost innate desire for the acquisition of knowledge, and hence a love of study, on the other hand, the great majority of children have no such natural inclination, and are urged by the force of secondary motives, that is, by holding out inducements to study based upon the attainment of things in which they do take an interest.

All children are more or less, prone to emulation; they love to excel others, particularly in things that bring commendation and honor, in this respect resembling those of maturer years; for this principle of action has been recognized as leading to eminence in every department of human effort. Hence, in schools and colleges, emulation is an important and valuable incentive which the educator may, by no means, cast aside. Of course, it is not to be allowed to degenerate into personal strife, animosity, or jealousy; nor is it to be indulged in such a manner as to obliterate the pupil's real interest in the study pursued. It is always to be impressed upon the student's mind that he is working in a good cause, and that he should strive to attain to the highest possible degree of excellence in it; higher, if he can, than that which he has been attained by any of his fellow students. Thus what others achieve becomes the measure of what can be done by him if he exerts himself to the utmost, and after the standard beyond which he is to go in order to obtain the prize of excellence.

**Encouragement**, as an educational incentive, is of indispensable importance in dealing with a certain class of minds, particularly with those characterized by an excess of caution, timidity, and diffidence. Many teachers repress the exertions of their pupils in order to discern their true character, so as to be able to ascertain the amount of effort they may have put forth in order to accomplish an assigned task, or to avoid a temptation to do wrong. Adopting an opposite course, they sometimes condemn alike all who fail to attain it, making no allowance for diversity of talent, opportunity, or the power of will; whereas the true test of a pupil's merit is not the accomplishment of the task, but the exertion put forth and the self-control exercised in the endeavor to comply with the teacher's precepts or directions.

Encouragement consists in adjusting the standard of success to this peculiar circumstance and traits of the pupil. If the latter is dull, indolent, self-indulgent, feeble in will, and yielding easily to temptation, the educator who recognizes these traits, accepts with satisfaction the feeblest efforts at amendment which he sees have been put forth, and by judicious commendation induces stronger and more persistent ones, until the foundation of moral or intellectual strength has been safely laid. Timid children must be encouraged to lay aside their diffidence. It is shown that they are groundless. They must not be repressed by harsh words of censure, or by those forms of punishment which should be the exclusive penalty of wilful wrongdoing. On the contrary, they should be made to feel that, even if they have failed, they have won their teacher's approving smiles by their honest efforts.

Some minds, on the other hand, need urging rather than gentle encouragement; and the latter, in the form of excessive praise to talented pupils, is often a means of flattering their vanity, and thus operating as a kind of moral poison, destroying the force of every true stimulus to activity. The following are the suggestions of practical educators: Encouragement induces confidence and children, more than others, need it. Let it be given in all cases where this can be honestly done. To a want of this in the discipline of classes are to be ascribed the timidity and reserve so often manifested among pupils by a

hesitating manner, a low voice, and a tone of inquiry in response, especially to strangers. A proper degree of encouragement renders them confident and spirited, eager to tell what they know, and in an audible tone of voice. Encouragement has a powerful influence in promoting both mental and moral improvement.

**Enthusiasm** is an emotion of so strong a kind as to begot self-forgetfulness, and to awaken the most powerful energies of the mind. When made to rest upon an admission of the good, the true, and the beautiful, it becomes an educational stimulus of a very useful and effective character; it must not, however, be perverted to supersede the exercise of conscience, or the sense of what is right, and thus degenerate into moral weakness. Earnestness, rather than enthusiasm, should be the quality inspired by the educator; and this is to be effected through the force of example, because the sympathetic influence of the true teacher upon the mind of his pupil is almost without limit. Especially should that spurious kind of enthusiasm be repressed which is characterized by a habitual excitement about everything that is new, and which tends to destroy everything that is rational and stable in the mind. The enthusiasm of the educator is an important quality in the teacher as well as in the pupil; indeed, a teacher can scarcely meet with any true success in his profession who is not enthusiastically devoted to it.

**Evening Schools, or Night Schools**, have been established in many countries, generally in large cities, as a part of the public-school system, for two purposes—(1) to give to those of the school population who cannot avail themselves of the advantages of the day school an opportunity to obtain an elementary education; and (2) to enable adults who have finished the course of instruction in the public day school to acquire additional knowledge, especially on subjects relating to their particular occupations or professions. In England, France, Italy, and Germany, the evening elementary schools are for children employed in factories; in the United States, a large portion of the pupils of evening schools consist of persons who have passed the college age. In most cases, the school regulations exclude all children below a certain age, and also provide that no pupils shall be admitted who are not engaged in a useful occupation during the day.

Evening high schools, which offer instruction in the higher branches of study, or afford technical instruction to artisans and others, like the Cooper Union of New York, the Mary-land Institute in Baltimore, and the Polytechnic Institute of St. Louis, are powerful agencies for good. In some of the large cities of the United States, foreigners derive very great benefit from the evening schools, in the instruction afforded in the English language by teachers who speak the language of the students. Free evening drawing schools are quite numerous in many parts of the United States as well as in some of the countries of Europe.

There can be no doubt that such schools constitute an essential part of every common-school system, particularly in large communities, so which many children are obliged to leave the day school before they have acquired even the rudiments of an education. The office of technical schools, while different, is equally important, since the supply of skilled labor in any community is one of the most valuable elements of its wealth and prosperity.

**Faculty**, a term originally applied to a body of persons whom public law conferred or right is granted; hence, in a college or university, the faculty consists of those upon whom has been conferred the right of teaching as professors of specific subjects. The faculties of a university are subordinate corporations, each consisting of a body of teachers, or professors, in some particular department of knowledge. At first the European universities of Paris, Bologna, and Cambridge, faculties—that of arts and that of theology, to which, in the thirteenth century, those of canon and civil law and of medicine were added. The faculties of Paris were subsequently transferred from the University of Paris to the

German universities; the faculty of arts was afterward named the philosophical faculty. Many changes have been introduced in this part of university organization since that time. In American universities and colleges, the faculty consists of a body of professors, with the president at its head, and has the power of conferring degrees.

**Fellow**.—This term signifies membership in a learned society or of a college. At Oxford and Cambridge it is applied to a member of a college who participates in its revenue and government. Fellows are usually elected from the bachelors who have taken the highest degree in the university, and receive remuneration for the fellowships. At different colleges, both at Oxford and Cambridge, the fellowships are held under varying conditions. As a rule, they are worth from \$1,000 to \$1,250 a year, with rooms and commons, and are tenable for about seven years. In American colleges or universities fellowships are merely distinctions to worthy students. As a rule, they are worth from \$1,000 to \$1,250 a year, with rooms and commons, and are tenable for about seven years. In American colleges or universities fellowships are merely distinctions to worthy students. As a rule, they are worth from \$1,000 to \$1,250 a year, with rooms and commons, and are tenable for about seven years. In American colleges or universities fellowships are merely distinctions to worthy students. As a rule, they are worth from \$1,000 to \$1,250 a year, with rooms and commons, and are tenable for about seven years.

**Grammar Schools**, so-called, not because they gave instruction in English grammar, but from the fact of their making the teaching of Latin and Greek—particularly the former—sometimes exclusively, the former—their especial aim, existed in England from the earliest times. In England, the endowed grammar schools are very numerous, and many of quite ancient foundations. They are the same as what have been called classical schools, belonging to the class of *middle schools*, and distinguished by a secondary character. They correspond to the *gymnasiums* of Germany and the *lycees* of France; in the latter, however, there is a course of instruction in modern languages, running parallel with the ancient course of classical pupils, beyond the college age.

Grammar schools, in the United States, were originally of the same character as in England, but the gradual development of the common-school system in the United States, joined with the partial decline of Latin and Greek as instruments of education, and the demand for studies of a more practical character for the ordinary duties of life, have led to a different application of the term *grammar schools*. The study of English grammar having taken the place of Latin grammar in schools of an elementary grade, such schools came to be designated *grammar schools*, and the former grammar or classical schools received the name of *high schools* or *academies*. In most of the public-school systems of the United States, Union, grammar schools are schools of a grade between the primary schools in which the first rudiments of instruction are imparted, and the high schools, in which the instruction, so called, has a primary, an intermediate, and a grammar department.

**Gymnasium**, a term applied, in ancient Greece and Rome, to a place of physical exercises. It is the name of the principle or law according to which every action becomes easier by repetition. The result of such repetition or practice, when the process is complete, is called a habit or *habitus*, and thus acquired possessions, and so distinguished from original or instinctive endowments. The principle of habits operates throughout the whole of the development of the intellect as mental. Thus all muscular actions

become perfected by repetition and habit, requiring less and less coöperation of the conscious mind. We thus see that habit, memory, to which indeed it is so closely allied, has its basis in certain properties of the physical organism.

In the region of mental activity we observe the effect of habit in the way in which thoughts become firmly associated with another in definite groups or series, as the consequence of repetition or custom, and also in the way in which the thinking processes gain in facility and exactness through practice. The emotional sensibilities again are under influence of the same law, though in a less obvious manner. The operation of the principle here is seen in the building up of firm attachments and permanent affections toward the objects and persons in the child's environment, with their correlative sense of want and craving when these are absent. Finally, habit rules in the domain of voluntary action. All the higher exercises of will in checking impulse and controlling the thoughts and feelings become perfected by customary performance, and in that way the so-called *habits*, as temperance, truth, etc. are built up. Habits have been divided into *intellectual* and *moral*, and also into *active* and *passive* habits.

From this short account of the nature and scope of habit we may easily see that it is the great guiding principle of education. According to Locke, it is the secret of instruction in all arts, and, indeed, in conduct too, to get what we would teach settled in the pupil by practice till it becomes a *habit*. Good habits should be formed at as early a period as possible; because repetition shows that when thoroughly established in childhood or youth, they generally continue, with more or less strength, through life. Hence the importance of making these qualities and observances habits, which constitute the elements of practical success in every walk of life: such as punctuality, order, regularity, and perseverance; to which may be added neatness, courteous attention, the waste of others, forbearance, and self-control.

For the same reason, bad habits should be eradicated before they have reached that stage, after which they are almost entirely disappear. It is, indeed, rarely the case that thoroughly fixed habits are wholly removed; hence the teacher should strive to counteract their evil influence, or neutralise their activity, by the use of a contrary nature. In dealing with the bad habits of children, the teacher should appreciate, and make due allowance for, the force of habit.

**Humanities** (*Lat. humaniores* or *literae humaniores*), those branches of education, or study, which are included in what is called polite or elegant learning, as languages, grammar, rhetoric, philology, and poetry, with all that pertains to what is called polite literature, including the ancient classics. The name implies that the study of these branches, in opposition to the physical sciences, which especially develop the faculties of the body, has a tendency to *humanise* man—to cultivate particularly those faculties which distinguish him as man, in all his relations, social and moral; traits which make him a truly cultured man. In the older systems of education, the humanities took the lead; in the new, they have been, to a considerable extent, superseded by studies deemed more practical, from a utilitarian point of view. The contest between the humanities and the so-called practical studies, as branches of higher education, is still rife. The humanities are, at present, more commonly designated *belles-lettres*.

**Illiteracy** is a term used at present to denote the inability to read and write. The mere fact as to how many persons in any community are unable to read and write is not, in itself, of very great value; but in relation to ignorance and knowledge, it is highly important, as marking the dividing line, on one side of which may be placed all those who are hopelessly condemned to the perusal of books, and are, therefore, deprived of all the advantages to be derived from their study or perusal; and, on the other, all who,

by means of such knowledge and such sources of information, have been placed on the high-road to thrift, skill, intelligence, culture, virtue, and every other element of the highest civilization.

To the individual, illiteracy is a most deplorable misfortune; to the community, in proportion to its extent, it is an acknowledged evil. The principle of free schools is derived from a consideration of the numerous evils which popular ignorance entails upon a community; and of this ignorance illiteracy is the exponent. On the same principle is based all legislation for compulsory attendance at schools. These principles have, however, been called in question; but very rarely. Parents, it has been said, cannot justly be forced to give their children a certain amount of education, unless it is assumed that this education is as necessary for the mind as food and clothing are for the body; but of course this is an assumption that cannot be maintained.

National systems of education have regard to the good of the community, not merely, or chiefly, to the good of the individual. The want of literary education is the source of numerous ills to the body politic, which legislation should strive to remove. The statistics of illiteracy are thus of the greatest value, in indicating the progress or retrogression of a nation in the most important elements of well being.

The following percentages indicate the relative illiteracy of the chief nations of the world. In Roumania, 88.4 per cent of the population can neither read nor write; in Servia, 79.3 per cent; in Portugal, 79.2; in Spain, 68.1 per cent; in Russia, 61.7 per cent; in Hungary, 47.8 per cent; in Austria, 35.6 per cent; in Italy, 32.9 per cent; in Greece, 30 per cent; in Belgium, 10 per cent; in Ireland, 7.9 per cent; in France, 4.7 per cent; in England, 3 per cent; in Scotland, 2.6 per cent; in The Netherlands, 2.3 per cent; in Finland, 0.5 per cent; in Denmark, 0.2 per cent; in Switzerland, 0.18 per cent; in Sweden and Norway, 0.08 per cent; in the British Empire, 0.05 per cent; and in Saxony, Bavaria, Württemberg and some other German states only rarely a person can be found who cannot read and write. In the United States the ratio of illiteracy among the whites is 6.2 per cent.

**Illustration** in its most comprehensive meaning is the rendering of an idea or truth clear to the mind. This is done by showing what is presented in a relation of likeness to some known thing, and so promoting the process of mental assimilation. Hence all illustration proceeds by connecting by some link of similarity, affinity, or analogy, what is new and obscure with what is old and familiar. Illustration may be employed in the description of some concrete object, as in the use of illustrative analogies in setting forth geographical or historical facts. It is chiefly required, however, in expounding all abstract ideas and principles. Here the mind depends upon a series of suitable examples or instances which may serve to exhibit the abstract idea in a living, concrete form. Illustration, though it commonly refers to bringing out points of similarity, includes the setting forth of contrast as well.

**Imagination** may be popularly defined as the power of mentally picturing things. If this picturing means the recalling to mind of something which we have actually seen, it is known as *reproduction*, or *evocation*, whereas if it means the formation of a new mental image it is known as *constructive* imagination. The imagination is exercised upon mental pictures, the fictitious products of poetry and art, but about common realities.

The cultivation of the imagination thus subverts two, main ends—knowledge and æsthetic delight. The first is illustrated in the kind of concrete subject to which poetry and history, where the pupil is required to reproduce the impressions of his past experience, with a view to constructing images of the things of the world, are subjected by the teacher. It is further illustrated, though in a less obvious way, in science-teaching, the abstract principles of which

can only be reached by preliminary processes of imagination.

The cultivation of the imagination for æsthetic purposes is carried on in close connection with the development of the feelings and the taste. Here the object of the educator should be to render the child's mind sensitive and responsive to what is beautiful, pathetic, sublime in the objects of nature, so that his imagination may be stimulated to a vivid realization of the same. The imagination is commonly included among the faculties, and is a strong and highly developed in the child; yet it is important to distinguish between the random, unguided movements of childish fancy and the orderly progress of a trained imagination.

**Individuality** may be defined as the sum of mental and moral qualities which characterize a particular person, distinguishing him from other persons. Such individual peculiarities have their conditions in the physical organism, a fact clearly recognised in the doctrine of *temperament*.

According to the universal biological law, that all life is not sound to exist one another (within certain limits), every child's brain, together with its constitution as a whole, has its own peculiar stamp from the first. And this physical peculiarity serves to determine the special mental traits, intellectual and moral. Within the limits of the typical human development every child is impelled to follow a line of development of its own. This impulse is much more marked in some children than in others. A strong individuality is an integral element in that later moral product which we call character.

The educator is perhaps naturally inclined to regard individuality as an obstacle and a limitation, since in extreme cases it implies resistance to his guiding influences. Here, however, we must distinguish between individuality which involves no deviation from the normal type, and eccentricity, which implies such deviation. Rightly considered, individuality is not something wrong which the educator has to correct, but one chief aim of the work of education itself.

The object of the teacher should be to make a child's individuality a source of intellectual and moral peculiarities, with a view to develop all that is valuable in these, and so produce a fine individual. This furtherance of individuality has to be harmonised with the development of a typically common human being. Thus, in intellectual education we should aim at securing a certain general culture of the faculties by a common plan of study, and, at the same time, a special training of individual aptitudes by selected or optional studies.

**Inductive Method** is but another name for the *developing method*. It is so-called because it is based upon the principle of logical induction, or the process of deriving general principles from an observation and comparison of individual facts. Instead of teaching definitions, principles, and rules arbitrarily, and illustrating them by means of examples who uses the inductive method, calls the attention of the pupil to a sufficient number of the facts to enable him to find the principle or rule for himself. The learning of the definition, which, in the deductive method, is the first thing to be done, in the inductive method, is the last step in the process. Most text-books follow the deductive method, but the most effective elementary instruction is inductive.

**Instruction** means the informing of the mind by a communication of knowledge. It is commonly distinguished from *education*, which aims not so much at the distribution of knowledge as at the development of faculty or power. Instruction or teaching is correlated with learning, or the acquisition of knowledge, and is not to be determined by the surrounding conditions.

**Interest** describes the effect of feeling, and more particularly pleasurable feeling, in rousing and sustaining the attention. A feeling may be the impulse toward the acquisition of an object on the mind, as when a child is attracted by a pretty picture; or may be due to process of association and suggestion, as when

a child is interested in watching the preparation of its food. Interest is closely connected with curiosity. A child desires to know what can be known about objects that are interesting to him, such as his pet animal, his toys, etc. From this it is apparent that the mother or teacher has at the outset to seek to awaken in the child's mind a feeling of interest in the subject presented to it. This she will do partly by bringing out all that is striking, pretty, etc., in the subject, and partly by connecting it with known sources of interest in the child's surroundings. One chief aim of the instructor should be to develop new interests, answering to the different domains of knowledge to be dealt with, as history and natural science. It is evident that in order to awaken such a feeling of interest and study attention must be paid to individual differences of sensibility.

**Intuition, Intuitive Method.**—In its original and proper sense intuition is the apprehension of an object by one of the senses, and more particularly the sense of sight—in other words, the act of perception. In a secondary manner it has come to mean the grasp or understanding of an idea in so far as this approximates in character to a perception of the senses. Thus the distinct imaginative picturing or realization of any object, as a volcano, is a mode of intuition. We may thus be said to have an intuitive knowledge of any object or idea that we can distinctly perceive or imagine. Such intuitive knowledge is marked off from symbolic knowledge—*e. g.*, that of large numbers, which does not admit of being reduced to a sensible or picturable form. It will be evident, therefore, that intuitive method in teaching consists in reducing abstract ideas as far as possible to sensible concrete, in setting out in the exposition of any abstract notion, such as an angle, a verb, justice, with concrete illustrations addressed to the senses or to the pictorial imagination. It thus corresponds pretty closely with the inductive method.

**Judgment, Training of.**—This department of intellectual culture needs no special attention, if the whole educational system, in other respects, is judicious and rational; *i. e.*, adapted to the individual body to age (degree of maturity) and peculiarities of character or endowment. Where this is not the case, an efficient corrective may be applied by bringing into exercise the pupil's mental faculties in various ways and in connection with various subjects. The departure must be taken from the sphere of the pupil's experience; he must be led (1) to an accurate observation of particulars—minute details; (2) to their collation, as preliminary to generalization; and (3) to their classification under appropriate heads. When general principles or rules have been established in the pupil's mind in this way, his judgment will be brought into

play in the application of the principle or rule to particular objects or facts.

Thus, in natural history, after the pupil has learned the characteristics of genera and species by minute and accurate observation of individual specimens, he cannot, without an exercise of judgment, determine whether any particular specimen, previously unobserved, belongs to one or the other of the genera or species. He must have a clear conception of the distinguishing qualities, both of the individual and of the class, in order to determine whether the characteristic exists or not. As regards concrete objects, the judgment is exercised from a very early age, and is constantly trained more or less by every legitimate process of intellectual education; but as regards abstract truths, this faculty is one of the last to attain a full or mature development.

Accuracy in judging depends very much on the mental habits formed during the period of early education. Habits of attention, careful observation, dispassionate, conscientious reasoning, and a profound and earnest love of truth, will qualify any person for the exercise of a sound judgment in regard to any subject of study or investigation. A mental character based upon such habits will be free from prejudice, and will readily learn to eliminate all passion from its intellectual processes; and hence its judgments, being solely based upon the facts acquired, will be correct or the contrary, in proportion to the accuracy and extent of the information possessed.

**Lectures, or Lecture System,** a method of giving instruction by formal expositions, generally written out and read to the learners. Lectures are, however, quite often extemporaneous, or delivered without previous preparation of the language. The lecture differs from the lesson chiefly in dispensing with the ordinary processes of the recitation room—question and answer, repetition, etc. The learners simply listen, or take notes, while the teacher reads or speaks, with or without illustrations by means of the blackboard, maps, pictures, apparatus, etc.

Lectures, as a system of instruction, are chiefly depended on in higher education—in colleges and universities, also in technical, scientific, and professional schools, because the students are supposed to have acquired a considerable maturity of intellect, enabling them to resort to knowledge without exercises specially designed to awaken attention or stimulate the understanding, but to exercise their own faculties in arranging it in their minds for use—in other words, coordinating it with their previously acquired knowledge.

**Liberal Education.**—This term is frequently used synonymously with collegiate or university education, but there is no good reason for thus restricting its meaning. It signifies generally an education which embraces a

fair knowledge of literature, science, and art, acquired for its own sake rather than for an objective purpose. It is difficult, however, to define the term accurately. According to Lord Brougham, the liberal education is that in which he who has learned "something of everything and everything of something," and according to Professor Huxley, he "who has learned to love all beauty and his neighbor as himself."

**Libraries** constitute one of the most important instrumentalities for stimulating the intellectual improvement of the people, as well as for the mental and moral training of pupils in schools. This has been recognized in the legislation of many of the states of the American Union, by making provision for supplying the schools and school-districts with libraries of interesting and useful books.

The value of a school library will depend upon the character of the books of which it is composed, and the uses to which it is applied. A large and expensive collection of books is not needed; but the books should be instructive and interesting to children, so that through their perusal they may not only obtain useful information, but imbibe a taste for reading. By this means, an antidote may, in part at least, be applied to the influence of the trashy, exciting, and sensational literature, which so greatly abounds at the present time, and which is so apt to corrupt both the minds and morals of the young.

The spread of education has called into existence innumerable smaller libraries, ready of access, and providing such literature as the special tastes of readers demand. This public library system has naturally been most developed in highly educated countries, such as Germany, France, Great Britain, and the United States.

**Public Libraries** existed in ancient Egypt and Assyria, and Ptolemy is credited with the honor of introducing a public library at Athens about B. C. 337. Cicero and various wealthy Romans made collections of books, and several Roman emperors established libraries, partly with books obtained as spoils of war. By far the most celebrated library of antiquity was the Alexandrian.

In modern times, libraries of any note were founded in the second half of the eight century by the encouragement of Charlemagne. In France one of the most celebrated was that of the king, Louis XIV., at Versailles, and in Paris, in Germany the libraries of Fulda, Corvey, and in the eleventh century that of Hirsebau, were valuable. In Spain, in the twelfth century, the Moors had seventy public libraries, of which that of Cordova contained 250,000 volumes. In Britain and Italy libraries were also founded with great zeal. The Vatican library, Rome, and the Bodleian, Oxford, are particularly valuable in rare books and manuscripts.

### Chief Foreign Libraries

**Library of Congress.**—The Library of Congress was established in 1800, destroyed in 1814 by the burning of the capitol, afterward replenished by the purchase by Congress of the library of ex-President Jefferson, 6,760 volumes, in 1815, 35,000 volumes destroyed by fire in 1862, partially replenished by an appropriation of \$75,000; increased (1) by regular appropriation by Congress; (2) by deposits under the copyright law; (3) by gifts and exchange; (4) by the exchange of the Smithsonian Institution, the library of which, consisting of 40,000 volumes, was in 1866, deposited in the Library of Congress with the stipulation that future accessions should follow it. Other special accessions

have been; the Peter Force collection of 22,529 volumes, 37,000 pamphlets, purchased 1867; the Coust de Rochambeau collection of manuscript, purchased 1883; the Toner collection of 24,484 volumes and 10,000 engravings, gift in 1898 of Mrs. Gardiner G. Hubbard.

The collection is now the largest in the western hemisphere, and third in the world. It comprises about 1,750,000 printed books and pamphlets (including the law library, which, while a division of the Library of Congress, still remains at the capitol), manuscripts, maps and charts, pieces of music, and photographs, prints, engravings, and

lithographs. Of the printed books, probably one-sixth are duplicates not in use.

The collection is rich in history, political science, in official documents, National, State, and in literature and in Americana, including important files of American newspapers and original manuscripts. Many of the rare books and manuscripts belonging to the library are exhibited in show cases on the second floor.

**Manners.** the genuine or simulated manifestations of disposition toward each other, which occur in the intercourse of humans, including the ordinary use of the word *manners* restricts it to those personal and visible peculiarities of deportment which characterize the intercourse

mentioned. The agents commonly employed for this purpose are the eye, the voice, language, and gestures.

When persons are brought together without previous knowledge of each other, or with no common ground of taste or experience between them, custom has prescribed a conventional code of formal manners, characterized as etiquette, which serves to relieve the awkwardness of the situation. That this, however, is temporary in character, and not intended to survive its original uses, is evident from the fact that after it has, in great measure, been discarded, any attempt to revive it, as the exclusive medium of kindly expression, is regarded as just cause for resentment. The fugitive character of mere etiquette can never constitute it a substitute for that abiding kindness of disposition which finds expression in genuine politeness.

Manners, therefore, are more decidedly moral in their nature than a superficial observation would lead us to suspect; hence the usual association of "morals and manners."

The basis of agreeable manners is that humanity, or feeling of brotherhood, which, in a greater or less degree, pervades the human race, and which every century, by its multiplied means of communication, is tending to extend and strengthen. It is, therefore, essentially Christian, and persons may be regarded, not as an accomplishment merely, but as one of the legitimate ends of a thorough education. In social intercourse, agreeable manners are far more powerful than intellectual accomplishments; while the displeasure produced by rude manners often neutralises moral worth, and renders mental acquisitions, however great, comparatively useless. Momentous issues—even the destiny of a lifetime—may hang upon the apparently unimportant question of manners. To educate thoroughly, and neglect the means by which the person is to be made effective, is self-evident folly.

Beyond the ordinary rules of etiquette, no set rules can be given for the production of good manners; since, in addition to the moral basis above referred to, the person is dependent upon temperament; but no precept is half so powerful in furtherance of this end as the daily example of the teacher, the parents, or other persons with whom the pupil is brought into daily contact. The indirect though constant insistence upon the claims of every individual to respect and kindly attention, which is a practical recognition of this by the pupil, together with the daily example referred to, constitute, perhaps, the most effective method for the grafting of agreeable manners on the conduct of the pupil.

**Memory** indicates the mind's power of retaining impressions so as to be able to recall them for after use. The fundamental property of memory, called by psychologists retentiveness, underlies all acquisition, whether of knowledge or of moral habits. The development as the faculty of memory this power of retention lies at the base of all learning. It is governed by its own laws, chief among which are those of interest and attention, and those of association. It is one of the first powers to be developed, and as such claims the teacher's attention at the outset. Although in general strong in children, it presents peculiarities and marked individual differences in respect both of the general or average power of retaining, and of the retention of special varieties of impressions and knowledge.

The importance of the faculty as pre-eminently the organ of learning, has led educators to give it much attention.

What are the means of obtaining it in the minds of children? (1) It is plain that impressions will be reproducible in proportion to the strength and vivacity with which they are first made. This strength depends partly on the natural capacity of the child, partly on whether the stimulus in the object is such as to produce a strong impression. Thus it follows that wherever a real object can be presented to a child, it should be used in preference to any picture of it, and that a picture of it is better than a mere verbal description. Moreover, if more than one sense can be

employed, so much the better. If any object is to be remembered, the child will remember more easily, if he can touch, smell, and taste it, as well as see it. This arises partly from the fact that these different processes produce strong impressions, but partly also from what we call our second principle of memory.

(2) Every means should be used to concentrate the attention on the object. If we wish to make a child remember an object, the object must be allowed to lie before the child's eye or mind for some time.

(3) There must be frequent repetition. An object or thought is reproduced easily when it has been made to occupy a large space in the mind. The power of reproduction is limited by time, and the mind can only reproduce within certain limits in this respect. If, therefore, an object is to be reproduced, the faded impression must be renewed; and the renewal of the impression strengthens its hold. It is thus that a fact may become indelibly imprinted on the memory. The value of the repetition cannot be overestimated, but great care must be taken not to make it wearisome.

(4) The power of reproduction greatly depends on the state of the health. That there is a very close connection between this power and the body, is proved most conclusively by the numerous instances in which abnormal states of the brain are accompanied by abnormal developments of memory. When, therefore, a child forgets, it must not be always attributed to carelessness. A child learns a word on Monday, and knows it with perfect accuracy; but when he comes, on Tuesday morning, to repeat it, he finds he cannot. In all probability, the impression was weak to begin with, and he is unable to resist the many and more interesting ideas which have intervened; but the lesson is not lost. The original impression is there.

Various devices, called mnemonics, have been proposed in ancient and modern times for facilitating the retention and reproduction of what is learned. These refer to verbal retention, as in memorizing a speech, a series of names, etc. The underlying principle of all such mnemonic systems is the association of the consecutive beads of a verbal composition with the divisions of an extended surface or inclosed space, as the compartment of a building, so that when the eye or the imagination runs over these, the order of their arrangement in space would at once suggest the order in time of the words.

It is now commonly recognized that these devices can have but a very limited value, and are likely to be a hindrance, rather than a help in certain cases. In modern educational systems verse-form, rhyme, and alliteration, together with the inventing of disconnected matter—a jumble of exceptions to a grammatical rule, with the semblance of a connected meaning—have commonly been resorted to for the purpose of aiding the memory. The utility of producing verbal material, such as the names even of a reign, in a visible form, by means of a diagram, is well known to every teacher. All such contrivances depend for efficiency on the working of the laws of association—contiguity, and similarity, apart or in combination.

It is indisputable that we all instinctively tend to shorten the process of memorizing by a number of such ingenious devices, and that they may properly be made use of by the teacher. At the same time, great care must be taken lest, by an excessive use of these, the learner lapse into a mechanical way of learning. It is a far better exercise for the mind, and for the memory too, to associate things to be learned by their natural ties, rather than by artificial ones. And a truly scientific management and control of memory will consist in forming a habit of associating the mind on the subject matter to be learned, of judiciously selecting important points, and arranging the whole with referentialness, and finally of making the fullest use of the laws of association in linking part with part, and the whole with what is already known.

**Mischievousness**, as applied to the disposition of a child, or school pupil, is the occa-

sional transgression of an established rule in a playful spirit, but without a malicious intention. This disposition is usually the result of the union of humor, or love of fun, with a good bodily health. The exuberance of spirits thus produced generally finds vent in actions which are denominated mischievous.

This spirit is so widely different from the usual breaking of rules with an evil intention, that the easy suppression of a continued exhibition of it rests entirely with the teacher; the good nature with which the mischievous act is accompanied generally causing the perpetrator to desist on a slight warning, or to bring the mischievous spirit under speedy control, two qualities only are necessary in the teacher—quick discernment of its real nature, and tact in correcting it. The want of these sometimes leads to needless irritation on both sides, and may end disastrously to the teacher's influence, and through that, to the discipline of the school.

If, on the other hand, the good humor of the transgressor is met by a similar feeling on the part of the teacher, the task of correction is greatly facilitated. In this case, while in the end, it secures a respectful obedience to the part of the pupil. If the mischievous disposition is not corrected in this way, it leads to vicious habits, which will tend to undermine, or permanently deprave the moral character.

**Moral Education** has for its sphere of operation the culture of those principles which influence or control the voluntary action of human beings. The elements of self-control exist in the greatest degree, and in every kind, as a part of its original constitution. They are distinct from its intellectual faculties, and need a special education, which is far more important than that of general education, because it contributes in much higher degree to the good both of the individual and of society.

The subject of moral education is *duy*, and its office is both speculative and active; that is, (1) to improve the moral character, rectitude in the pupil's mind—to teach what duty is—and (2) to cultivate a desire to do what is right for its own sake—to respect duty, to moral obligation, and to feel a sense of right—to listen to the voice of conscience; to which may be added, as an important additional object, to implant in the young mind such maxims as will aid the moral sense, and enable it to triumph over the natural propensities and desires, when the latter are in conflict with it.

The means employed in moral education are the following: (1) *Precepts*, addressed both to the understanding and to the conscience, the object being to enlighten the latter, which of itself does not recognize specific right or wrong; (2) *example*, appealing to the conscience, and being enforced by the love and respect felt by the child toward its educator, leading the former to feel that whatever is done by the latter is right, and hence should be imitated; (3) *habit*, inducing, by means of repetition, an inclination to act in the same way under the same circumstances; (4) *exercise*, for the purpose both of strengthening the moral feelings brought into play, and of forming habits. Exercise, in moral education, is just as important as in physical or intellectual education; indeed, there can be no training in moral education without making this on, the teacher must avail himself of every possible circumstance that arises in connection with his intercourse with the pupils, and make acquaintance with each other, to give occasion for this exercise, and thus form a basis for the desired culture of the moral faculties.

This culture or training must have a twofold object—(1) to cultivate virtues, and (2) to correct vices. Among the former, as especially necessary, may be enumerated truthfulness, honesty, justice, candor and modesty, kindness or benevolence, diligence, obedience to parents, authority, gratitude, fidelity to every promise or trust, and patriotism; and among the latter, the opposites of these, as lying and deceit, a disposition to steal, cruelty

to animals, unkindness and injustice to playmates, violence and combative spirit, temper, anger and irritability, obstinacy, laziness, irresolution, leading to procrastination, excessive self-esteem, leading to arrogance and self-conceit, etc.

These are specific qualities of character which need a particular recognition and treatment on the part of the educator; but when the moral sense has been thoroughly awakened, the Christian moral principle is to do unto others as we would that they should do unto us, we will comprehend, in approbation or condemnation, every class of actions, and shall be the means of all just discrimination as to what is virtuous and what is vicious.

But the conscience is not developed in children; and very often, not even in adults. Hence the need of moral discipline, in order to afford to the educator the means of bringing to bear upon his pupils external restraint, as preliminary to self-restraint; for it must be borne in mind that any government that does not contemplate the cultivation of the elements of self-control can soon be considered as forming a part of moral education. The three elements of sensibility usually appealed to in connection with moral discipline are, *the fear, love and respect*.

Children should be made to *fear* to do wrong; and this should be brought about as much as possible by what Herbert Spencer calls the *method of nature*, that is, by making punishment the necessary consequence of the wrongful act, on the principle involved in the maxim, "The burnt child dreads the fire." This eliminates the personal element in the fear implanted in the mind of the child. He does not *fear* the teacher, but he fears to offend—to do wrong. The same consideration excludes from discipline all threatening, scolding, and harsh words, for the purpose of engendering fear, and especially excludes all punishment. The fear to be excited in the mind of the child should not be an apprehension of personal safety, leading to meanness, cunning, and deception as a means of self-protection, but should be the fear of the displeasure that life has little relation to the concerns of that life. This want of relation sprung originally from the fact that the literary class, and the practical class, was a class apart, having only slight connection with the people of people who, possessing few political rights, were unworthy of consideration. The instruction given, therefore, was purposely of a kind to emphasize the exclusiveness of the educated class. Under the changed political conditions of our day, however, the tendency has steadily been to equalize the two classes in intelligence—to lift up the masses to the level of the educated, on the one hand, and, on the other, to bring the studies of the school and college more into accordance with the daily life of the majority.

Traces of the original exclusiveness still remain, however, in the antiquated, unpractical character of the instruction, as mentioned above. Almost every youth, on entering upon the business of life, becomes completely ignorant of the principles of arithmetic that he studied, for instance, so that he has little application to the concerns of daily life; the bookkeeping which was mastered so much difficulty, seems now, at this later date, to have been filled with theoretical cases which have no parallels in actual experience; even the geography, in which he attained such proficiency, has little place in his daily routine; while algebra, geometry, and many other studies, have none at all.

The result is a feeling of inferiority when he is brought in contact with other persons whose training has been entirely that of practical life, which leads him to suspect that his time has been wasted. Not till long afterward, perhaps, does he recognize the fact that the principles on which both theoretical and practical knowledge are based are the same, and that the ability to apply these principles was his chief want. The feeling of disappointment referred to might have been entirely removed, if, in his instruction, the teacher had kept constantly in mind, not the mental discipline alone,

but the *mental discipline* and the *adaptability to the affairs of life* of the knowledge used in acquiring that discipline.

One of the most useful instruments for accomplishing this double purpose is the newspaper. The *arithmetic* which is often taught by the use of unusual and improbable examples could be made a living and interesting thing by the use of problems to be found in its pages, which illustrate the actual prices of articles in daily use. Interest, discount, exchange, the price of bonds and stocks, could be made so familiar to the pupil in the way that the change from school to counting-house, which is now attended with such a want of ease and so much disappointment, would seem but the continuation of study in another class.

Reading, also, if taught from the newspaper, would familiarize the pupil with the terms used in the daily conversation of professional and business men; and, through the reports of proceedings in every field of human activity, fresh interest could be aroused in studies already taken up, while attention could profitably be called to those which are ordinarily pursued in more advanced courses; and a partial preparation for disquisitions could thus be unconsciously be made. *Geography and history* would receive increased attention, if they could be connected with the reports of the interesting events from all parts of the world which are daily chronicled, by inquiring into the position on the map, population, form of government, etc., of the different countries referred to. By following, in this way, the records of campaigns and battles, a knowledge of the topography of the country could be obtained almost without effort, which would be easily retained in the memory of the most careless scholar; while opportunity could, at the same time, be taken for digressions into its history.

Through its reports of strikes, labor troubles and cooperative associations, the newspaper and periodicals could also be made a medium for inculcating, in a familiar and unobtrusive way, the rudiments of political economy, usually so dry and uninteresting; while the accounts of great engineering feats, astronomical discoveries, and other studies, which are the voyages of discovery, would be more eagerly listened to, if the pupil were made to understand that the algebra, geometry, or geography which he had studied, were the fundamental relation to them all. The thought, also, that he might one day take part in similar work, would act as a spur to renewed exertion.

Any means within the teacher's reach of diverting the studies pursued of the dry, text-book character should be taken advantage of; and this cannot be done in any way so easily as by investing them with a human interest by showing that men and women similar to those with whom he daily associates are the actors in all these stirring events.

For this purpose hardly any medium is superior to that of the daily paper. The objections to the newspaper as a text-book, some of the facts were unfit for youthful minds to know, and that the hasty manner in which they were reported rendered their accounts not only worthless as models but injurious, as they no longer valued. To the first, it may be said that newspapers are now so universally read that pupils can hardly fail to see them or hear their contents discussed; and to the second, that active educators, having brought into the employ of the newspaper so large a share of the best talent, specimens of composition may now be found in any industrial or intellectual pursuit, and are not only innumerable but are not only exceptionally able in matter, but worthy of imitation for lucid statement and grace of expression.

The ability, independence, and rapidly increasing circulation of the daily press are fast rendering it a potent factor in education, and in countries where the necessities of daily life leave little time for that higher education which demands leisure and a competency for its accomplishment, a double purpose would be served by using it as a means of instruction, as not only giving to the minds of the pupils practical culture, but

the *mental discipline* and the *adaptability to the affairs of life* of the knowledge used in acquiring that discipline.

One of the most useful instruments for accomplishing this double purpose is the newspaper.

The *arithmetic* which is often taught by the use of unusual and improbable examples could be made a living and interesting thing by the use of problems to be found in its pages, which illustrate the actual prices of articles in daily use. Interest, discount, exchange, the price of bonds and stocks, could be made so familiar to the pupil in the way that the change from school to counting-house, which is now attended with such a want of ease and so much disappointment, would seem but the continuation of study in another class.

Reading, also, if taught from the newspaper, would familiarize the pupil with the terms used in the daily conversation of professional and business men; and, through the reports of proceedings in every field of human activity, fresh interest could be aroused in studies already taken up, while attention could profitably be called to those which are ordinarily pursued in more advanced courses; and a partial preparation for disquisitions could thus be unconsciously be made. *Geography and history* would receive increased attention, if they could be connected with the reports of the interesting events from all parts of the world which are daily chronicled, by inquiring into the position on the map, population, form of government, etc., of the different countries referred to. By following, in this way, the records of campaigns and battles, a knowledge of the topography of the country could be obtained almost without effort, which would be easily retained in the memory of the most careless scholar; while opportunity could, at the same time, be taken for digressions into its history.

Through its reports of strikes, labor troubles and cooperative associations, the newspaper and periodicals could also be made a medium for inculcating, in a familiar and unobtrusive way, the rudiments of political economy, usually so dry and uninteresting; while the accounts of great engineering feats, astronomical discoveries, and other studies, which are the voyages of discovery, would be more eagerly listened to, if the pupil were made to understand that the algebra, geometry, or geography which he had studied, were the fundamental relation to them all. The thought, also, that he might one day take part in similar work, would act as a spur to renewed exertion.

Any means within the teacher's reach of diverting the studies pursued of the dry, text-book character should be taken advantage of; and this cannot be done in any way so easily as by investing them with a human interest by showing that men and women similar to those with whom he daily associates are the actors in all these stirring events.

For this purpose hardly any medium is superior to that of the daily paper. The objections to the newspaper as a text-book, some of the facts were unfit for youthful minds to know, and that the hasty manner in which they were reported rendered their accounts not only worthless as models but injurious, as they no longer valued. To the first, it may be said that newspapers are now so universally read that pupils can hardly fail to see them or hear their contents discussed; and to the second, that active educators, having brought into the employ of the newspaper so large a share of the best talent, specimens of composition may now be found in any industrial or intellectual pursuit, and are not only innumerable but are not only exceptionally able in matter, but worthy of imitation for lucid statement and grace of expression.

The ability, independence, and rapidly increasing circulation of the daily press are fast rendering it a potent factor in education, and in countries where the necessities of daily life leave little time for that higher education which demands leisure and a competency for its accomplishment, a double purpose would be served by using it as a means of instruction, as not only giving to the minds of the pupils practical culture, but

to animals, unkindness and injustice to playmates, violence and combative spirit, temper, anger and irritability, obstinacy, laziness, irresolution, leading to procrastination, excessive self-esteem, leading to arrogance and self-conceit, etc.

These are specific qualities of character which need a particular recognition and treatment on the part of the educator; but when the moral sense has been thoroughly awakened, the Christian moral principle is to do unto others as we would that they should do unto us, we will comprehend, in approbation or condemnation, every class of actions, and shall be the means of all just discrimination as to what is virtuous and what is vicious.

But the conscience is not developed in children; and very often, not even in adults. Hence the need of moral discipline, in order to afford to the educator the means of bringing to bear upon his pupils external restraint, as preliminary to self-restraint; for it must be borne in mind that any government that does not contemplate the cultivation of the elements of self-control can soon be considered as forming a part of moral education. The three elements of sensibility usually appealed to in connection with moral discipline are, *the fear, love and respect*.

Children should be made to *fear* to do wrong; and this should be brought about as much as possible by what Herbert Spencer calls the *method of nature*, that is, by making punishment the necessary consequence of the wrongful act, on the principle involved in the maxim, "The burnt child dreads the fire." This eliminates the personal element in the fear implanted in the mind of the child. He does not *fear* the teacher, but he fears to offend—to do wrong. The same consideration excludes from discipline all threatening, scolding, and harsh words, for the purpose of engendering fear, and especially excludes all punishment. The fear to be excited in the mind of the child should not be an apprehension of personal safety, leading to meanness, cunning, and deception as a means of self-protection, but should be the fear of the displeasure that life has little relation to the concerns of that life. This want of relation sprung originally from the fact that the literary class, and the practical class, was a class apart, having only slight connection with the people of people who, possessing few political rights, were unworthy of consideration. The instruction given, therefore, was purposely of a kind to emphasize the exclusiveness of the educated class. Under the changed political conditions of our day, however, the tendency has steadily been to equalize the two classes in intelligence—to lift up the masses to the level of the educated, on the one hand, and, on the other, to bring the studies of the school and college more into accordance with the daily life of the majority.

Traces of the original exclusiveness still remain, however, in the antiquated, unpractical character of the instruction, as mentioned above. Almost every youth, on entering upon the business of life, becomes completely ignorant of the principles of arithmetic that he studied, for instance, so that he has little application to the concerns of daily life; the bookkeeping which was mastered so much difficulty, seems now, at this later date, to have been filled with theoretical cases which have no parallels in actual experience; even the geography, in which he attained such proficiency, has little place in his daily routine; while algebra, geometry, and many other studies, have none at all.

The result is a feeling of inferiority when he is brought in contact with other persons whose training has been entirely that of practical life, which leads him to suspect that his time has been wasted. Not till long afterward, perhaps, does he recognize the fact that the principles on which both theoretical and practical knowledge are based are the same, and that the ability to apply these principles was his chief want. The feeling of disappointment referred to might have been entirely removed, if, in his instruction, the teacher had kept constantly in mind, not the mental discipline alone,

but the *mental discipline* and the *adaptability to the affairs of life* of the knowledge used in acquiring that discipline.

One of the most useful instruments for accomplishing this double purpose is the newspaper. The *arithmetic* which is often taught by the use of unusual and improbable examples could be made a living and interesting thing by the use of problems to be found in its pages, which illustrate the actual prices of articles in daily use. Interest, discount, exchange, the price of bonds and stocks, could be made so familiar to the pupil in the way that the change from school to counting-house, which is now attended with such a want of ease and so much disappointment, would seem but the continuation of study in another class.

Reading, also, if taught from the newspaper, would familiarize the pupil with the terms used in the daily conversation of professional and business men; and, through the reports of proceedings in every field of human activity, fresh interest could be aroused in studies already taken up, while attention could profitably be called to those which are ordinarily pursued in more advanced courses; and a partial preparation for disquisitions could thus be unconsciously be made. *Geography and history* would receive increased attention, if they could be connected with the reports of the interesting events from all parts of the world which are daily chronicled, by inquiring into the position on the map, population, form of government, etc., of the different countries referred to. By following, in this way, the records of campaigns and battles, a knowledge of the topography of the country could be obtained almost without effort, which would be easily retained in the memory of the most careless scholar; while opportunity could, at the same time, be taken for digressions into its history.

Through its reports of strikes, labor troubles and cooperative associations, the newspaper and periodicals could also be made a medium for inculcating, in a familiar and unobtrusive way, the rudiments of political economy, usually so dry and uninteresting; while the accounts of great engineering feats, astronomical discoveries, and other studies, which are the voyages of discovery, would be more eagerly listened to, if the pupil were made to understand that the algebra, geometry, or geography which he had studied, were the fundamental relation to them all. The thought, also, that he might one day take part in similar work, would act as a spur to renewed exertion.

Any means within the teacher's reach of diverting the studies pursued of the dry, text-book character should be taken advantage of; and this cannot be done in any way so easily as by investing them with a human interest by showing that men and women similar to those with whom he daily associates are the actors in all these stirring events.

For this purpose hardly any medium is superior to that of the daily paper. The objections to the newspaper as a text-book, some of the facts were unfit for youthful minds to know, and that the hasty manner in which they were reported rendered their accounts not only worthless as models but injurious, as they no longer valued. To the first, it may be said that newspapers are now so universally read that pupils can hardly fail to see them or hear their contents discussed; and to the second, that active educators, having brought into the employ of the newspaper so large a share of the best talent, specimens of composition may now be found in any industrial or intellectual pursuit, and are not only innumerable but are not only exceptionally able in matter, but worthy of imitation for lucid statement and grace of expression.

The ability, independence, and rapidly increasing circulation of the daily press are fast rendering it a potent factor in education, and in countries where the necessities of daily life leave little time for that higher education which demands leisure and a competency for its accomplishment, a double purpose would be served by using it as a means of instruction, as not only giving to the minds of the pupils practical culture, but

also habituating them to the constant use of the newspaper as, perhaps, their chief source of intelligence.

**Object Teaching, or the Pestalozzian Method.**—A method of instruction in which objects are employed by means of which to call into systematic exercise the observing faculties of young pupils, with the threefold object, (1) to cultivate the senses, (2) to train the perceptive faculty, so that the mind may be stored with clear and vivid ideas, and (3), simultaneously with these, to cultivate the power of expression by relating with the ideas thus formed appropriate language.

The merit of introducing object teaching as a special method of elementary instruction, is usually attributed to those who, like Comenius, Locke, Rousseau, Haesdow, Rochow, and others based their systems of education, more or less, upon the same principle; that is, they recognized the necessity of communicating ideas, or of affording to the mind the means to grasp ideas from objects, by actual perception, before attempting to teach the verbal expression of those ideas; and that, without such ideas, mere "book-learning" is useless.

Pestalozzi appears, however, to have had only a slight knowledge of the works of those educators. Inspired by the reading of Rousseau's *Emile* to study the phases of mental growth, he arrived at the conclusion that the teaching of his day was fundamentally wrong, from its violation of, or inattention to, the laws of mental development. These laws he believed to be, (1) that the knowledge of things should precede that of words; (2) that, for the acquisition of this knowledge, the only effective agents, in the first stages of mental growth, are the senses, chief of which is the eye; (3) that the first objects to be studied by young children are those directly surrounding it, and these only, in their simplest forms and relations; and (4) that from these objects as a center, the sphere of knowledge should be widened by a gradual extension of the powers of observation to more distant objects.

The first instruction, therefore, according to this plan, should consist in concentrating the attention upon those objects, and in a way as to result in a thorough training of the observing faculties, so that the conceptions with which the mind is stored may be as well defined, and as true to nature, as possible. So impressed was Pestalozzi with the correctness, and the supreme importance, of this method, that he declares that the sum of his achievements in education is the establishment of the truth that "the culture of the outer and inner senses is the absolute foundation of all knowledge—the first and highest principle of instruction."

Object teaching should be begun as early as possible, and in the manner of the kindergarten, and should be followed by objective and conceptive teaching, which should be carried through every branch of learning. The mental growth of pupils, however, should not be retarded by a superfluous use of this method. A safe criterion, by which the teacher may, at any moment, whether he has made a proper use of the object method, may be found in the self-activity of his pupils, their ability to grasp, in their answers to his questions, the general fact, proposition, or law.

This method is justly called the *development method*, the pupils' minds being made to develop themselves, the teacher only suggesting what they are to discover. Every pupil is, as it were, to rediscover every science in the genetic method, a difficult task for the teacher, and apparently a circuitous way for the pupil. But because of its thoroughness it is the most rapid way of learning; and its results are indelibly fixed in the mind. This method, also, if early begun, and consistently carried out, is successful in every other way, and saves precious time which, later in life, may be devoted to those higher branches that lie beyond the common-school course, but which are every year becoming, in many cases, highly desirable, and, in some, indispensable.

**Order.** In school management, implies (1) the existence of a judicious system of regulations, and (2) a uniform and habitual observance of them by the pupils. It is one of the most important elements in which the schoolmaster enables the teacher to concentrate all its educative agencies without embarrassment or interruption.

The characteristics of good order are (1) attention on the part of the pupils to the legitimate work of the school, (2) obedience and respect to teachers, (3) decorous deportment—the absence of a tumult, rudeness, frivolity, and frolicsome actions, calculated to disturb the school, and (4) propriety and exactness in the school evolutions and drill. Under the result of skill and tact on the part of the teacher; but it cannot be fully maintained unless he is vested with suitable authority, so as to be able to correct disorder as soon as it manifests itself. General disorder in a school can result only from bad management, indicating incompetency on the part of the teacher.

**Patience** is the calm endurance of necessary characterizing. This quality, though similar to *perseverance* in the prolonged effort which its exercise presupposes, differs from it chiefly in the equal temper with which that virtue meets the patient spirit of the most important elements in the character of a successful educator. Many occasions, indeed, will occur, when patience will be the only virtue that will command success. Its cultivation, therefore, is desirable, both on this account, and because of its value in mental discipline. Its possession, moreover, is necessary both to the teacher and to the pupil. For the former, it is of special value in his treatment of the varying dispositions with which he has to deal.

The provocations to impatience and intolerance are so many and so constant, that, without patience, the teacher's life will be a continued series of annoyances. Impatience in children is the result either of temperamental irritability, or of a preliminary error in dealing with it, the teacher should remember that nothing so tends to develop and foster it in his pupils as a constant practical exhibition of his daily intolerance.

As nothing is so infectious as ill-temper, so nothing tends so rapidly to curb ill-temper as that quiet forbearance which a patient spirit evinces. The child, like the adult, is a mental power, also, act with much greater effect upon the calmness of the judgment is undisturbed by ill-temper or impatience. Perseverance may, indeed, exist without patience, and to a certain extent may accomplish its objects; but it is safe to say that more than half the good results which perseverance aided by patience might accomplish, are thrown away if patience does not accompany it.

**Peabody Education Fund.**—A fund established by George Peabody in 1867 and 1869 for the purpose of fostering education in needy communities in the Southern states. Of the \$3,500,000 thus contributed, state bonds of Mississippi and Florida to the amount of \$1,380,000 were afterward repaid. The fund was placed in the charge of a board of fifteen members, and the trust was to terminate at the discretion of the trustees in thirty years. The chief beneficiaries were elementary schools, preferably those already established, to which grants were made proportional to the number of students. It soon became evident that the chief need was for trained teachers and Peabody normal school, later Peabody College, was established in 1875 at Nashville, Tenn. The amounts thus distributed have averaged \$75,000 annually. By a vote of the board in 1906 the trust is to be dissolved as soon as its affairs can be wound up, a large sum going to the new George Peabody College for Teachers.

**Pedagogy, or Pedagogics**, the science and art of giving instruction to children, particularly in school, or as by a school-teacher. This term is more generally used in Germany than in this country. In the latter it is the science in which the theory and art of the teacher or educator are designated as *instruction* or

*education*; indeed, the word *pedagogue* is, in these countries, used as a term of reproach.

**Perception.** Observation.—By the act of perception is meant the process of the mind in unifying the impressions received through the senses into a knowledge of objects. Perception is the first stage in that intellectual elaboration of sense-impressions which constitutes abstract thought. To perceive, i. e., distinguish and recognize objects, implies normal and trained senses. When sense-impressions are indistinct, the knowledge of objects will be incorrect. But it implies more than this, viz., the interpretation of the impressions received at the moment by the aid of past experiences. Thus a child that sees its ball as a real object is translating visual impressions into imagined tactile experiences (feeling, lifting, rolling the ball). Hence perception is acquired. An infant does not see things as things, and cannot distinguish by the eye a flat drawing from a solid body.

The ordinary circumstances and needs of life compel every child to connect and interpret the impressions received through the senses. But such spontaneous acts of perception are apt to be rough and defective. The ends of exact knowledge require a more careful and systematic inspection of the objects, which is marked off as *observation*, and the branch of intellectual discipline that aims at securing it is known as the training of the *observing faculty*. As observed by any common object, as a rivet or a tree-trunk, so as to note all its peculiarities of form, color, etc., implies a strong, wide interest in objects. Thus the child, in its measure, and when the observing faculty has been drawn out from the first, the pleasure springing from the use of the organs of sense and from the gaining of new knowledge may be counted on as a sufficient motive.

A habit of observation presupposes both presence and openness of mind; in other words, freedom from mental preoccupation and reverie, and a willingness to see things just as they are, and not as we fancy them or would like them to be. The highest kind of observation combines exactness or minuteness, comprehensiveness, and rapidity. The close connection between exact observation and scientific induction renders it important to exercise the observing faculty by object-lessons as a preparation for science-teaching. Observation forms, however, the necessary preliminary to all studies; e. g., geography, mathematics, language.

**Perseverance.**—This is that quality of will by which an end is steadfastly pursued to the disregard of all extraneous sollicitations. It is closely connected with exact concentration on a subject of thought; and it may be said indeed to be a firm concentration of the mind to an object of desire. The moral value of this quality as one of the highest manifestations of will, and its great practical utility in life, render it incumbent on the moral educator to develop it to the utmost. It is, moreover, a moral quality which the discipline of the will is peculiarly well fitted to foster and strengthen. The learner should be led to see how success in study depends on perseverance, and how often, as the failure of the best and ablest scholars, as patient and unremitting effort defeats mere superiority of natural talent.

**Phonic Method**, a term applied to a method of teaching reading, in accordance with which pupils are taught to pronounce the words to use the sounds of the letters, instead of their names, so that they may at once perceive the result of the combination, and thus without difficulty be able to read the words. For example, when the pupil is required to pronounce the word *dog*, he does not say *de-o-g*, *dog*, but gives to each letter the proper sound, phonetic, and thus at once pronounces the word as the necessary product of the elements thus combined. This method is considered by teachers to possess many advantages over the old-fashioned way of committing to memory the names of the letters of the alphabet, and then teaching them to read by spelling exercises.

**Physical Education** is that systematic training of the bodily powers which tends to render them, in the highest possible degree, efficient in their several functions. The necessity for this training is generally acknowledged, as a basis for the higher departments of culture. Among the ancients—the Persians, the Greeks, and the Romans, especially, the highest respect was accorded to physical culture; and the means employed were generally well adapted to the purpose, although mostly empirical; but, at the present time, the researches of science supply a far better and more accurate basis for an effective system of bodily training.

Physical education looks to two objects:—(1) to encourage a normal development of bodily powers; and (2) to check morbid growth. Incidentally to these, of course, the preservation of health—that is, protection against disease—is an important object; since a condition of health is the foundation upon which all physical culture must rest; indeed, if children are successfully protected from disease influences and disturbances, normal development must result.

(1) The application of appropriate means to stimulate or guide the development of the bodily powers constitutes what is called *physical training*. This training may be (a) general, or (b) special. In the former, the general physical exercise must have for its object general development; beyond that, the special purpose of the training must dictate the nature of the exercises to be employed. Military drill, it is true, is often employed in schools to promote general development, but there is very much required in military discipline that is quite unnecessary for ordinary physical culture.

Such exercise, however, must not look exclusively to muscular development, but to the prompt use of muscular power in obedience to the dictates of mind. Such power systematically exercised in any given direction becomes almost automatic, as is seen in the case of the skillful oarsman, rider, or swordsman; or in adepts in athletic games, such as those of ball and cricket. All such means of physical culture become of special value, as bringing the powers of the body under the immediate control of the will; and, hence, under the name *athletics* they have been generally encouraged by the public, in the direction of superior education. In the same category are to be placed the exercises which regard the development of other physical powers, as the senses, the vocal organs, the hands, and, in a closer relation to intellectual education, the brain.

(2) To check morbid growth or to prevent disease, careful attention must be given to the surrounding of the child, particularly in school; as there he is subjected to constant restraint, and hence cannot exercise his natural instincts which would prompt him to escape from such surroundings. The preservation of children from morbid influences in school depends upon a great variety of circumstances.

The practical aim of physical education, under the influence of modern life, is almost always intellectual. Gymnastics and calisthenics, however, indirectly exert a moral influence which, of itself, makes their practice desirable. This is the moral influence which is produced in generous minds by the consciousness of bodily health and power, and a disposition to use that power worthily, being of influence to the child, by giving with it an element of immorality, which leads its possessor to acts of duplicity and meanness to preserve his equality.

There is still another phase of physical education to be considered—that which relates to the joint action of the mind and body through the medium of the senses. The minute subdivision of labor characteristic of the age in which we live, by giving a utilitarian value to the cultivation of the senses, is rapidly constituting this an element of increasing importance. Already, the success of numerous trades and occupations is dependent upon a nicety of discrimination by means of the eye, the ear, the taste, or the touch; and the number of these is steadily

increasing. The cultivation of the senses, therefore, is desirable from a merely utilitarian point of view; while for general culture, such as is required in many of the arts, its absolute necessity is manifest. Many considerations are to be taken into account, however, in the subject of physical education one of constantly increasing importance.

**Pictures.**—There are two main uses for pictures in schools—one to exercise and develop the moral sentiment, and the other to convey information to the mind, to fix it there, and to exercise the faculty of constructive imagination.

With regard to the latter use it may be pointed out that it has long been accepted as an axiom that the best explanation of a thing is the sight and study of the thing itself; and the next best is a photograph or exact unembellished picture of the thing. This mode of explaining and conveying information has been largely used from quite early times, but is still capable of considerably greater development—especially in the departments of geography and history.

But besides conveying information, pictures may be used, and indeed are almost indispensable, for the cultivation of one of the most valuable of the intellectual faculties—the constructive imagination; both when the mental images constructed are exact or nearly exact copies of some original which cannot be seen, or when the constructions are new combinations of material already acquired (as in science and in art, both literary and pictorial) in which latter case—when the combinations are new—pictures serve the purpose of suggestive models.

The use of pictures as aids to the memory is too widely recognised to need more than mention. There is one minor objection, however, which cannot be too often protested against; and that is in lessons of *observation*. In such cases pictures can never be properly used except when the pictures themselves are the objects to be observed, or when the picture instead of the thing itself differs hardly at all from studying a written account of the thing.

**Play.**—Play is activity carried on for the sake of the pleasure which attends it, and not of any ulterior object. As a variety of action, play is marked off from work and all serious occupation by its spontaneity, its freedom, and its want of the serious attitude which accompanies the latter. Play includes the exercise of limb and of mental faculty, so far as this is spontaneous, and not consciously subordinated to the ends of efficiency and growth.

It has been pointed out by Herbert Spencer that much of children's play is imitative of the actions of adults, and may be viewed as an anticipation of the functions of mature life. The region of play is an important field of observation for one who wishes to study the characteristics of childhood. It has, moreover, its educational uses. This is the case with all games that exercise the physical organs and the senses, and those that call into action the mental faculties. The well-known class of social games, again, which involve the exercise of measure of organization, and a common submission to rules are of undoubted value as an aid to moral education.

The educator has something to do both in the way of restraining and in guiding the play impulses of children. An absorbing passion for games and any degree of interest in them incompatible with necessary work must be strenuously opposed. On the other hand, the play-impulse may be directed into new, healthier channels, and so its value as a source of pleasure increased. Any such control, since it tends to destroy the spontaneity which is of the essence of play, should be attempted with much caution and judgment. The question how far it is possible to regulate the play-impulse for educational purposes has been discussed in connection with the kindergarten system.

**Praise and Blame.**—These constitute one of the most natural and proper means of influencing children's actions, and molding their moral character. The child is in gen-

eral very sensitive to the good opinion of others. An infant shows the germ of this love of approbation when it turns to its mother for an approving recognition of some little feat. On the other hand, the withholding of such approval, or the manifestation of disfavor, is a source of pain.

The instructor has to make frequent use of this desire for others' commendation, especially in the early stages of education. Before the child can itself judge what is right, and before the love of goodness is sufficiently strong, praise and blame are a valuable means of prompting and guiding its actions. Care must be taken, however, not to resort to either in excess. Lavish praise bestowed on actions which have little moral value is injurious. Commendation of what is meritorious and in cases of bare duty must be distinguished from the colder approval which is proper to the fulfillment of this last. On the other hand, too frequent censure is apt either to lower its sting by familiarity or to discourage and embitter the child.

Finally, it should be remembered that praise and blame have only a subordinate and temporary function in moral education. It is not well that the child lean too much on others' favorable opinion. It should be the object of the educator to exercise the child in the discrimination of value, and to lead to a commendation of value, and gradually to lead off its thoughts from the approbation itself to the moral standard which determines it. The child in school should be led to what is right for its own sake, and to find its highest satisfaction in an enlightened self-approval.

**Precocity.**—By a precocious child we understand one whose mental powers are developed in advance of his age. Precocity is thus tantamount to rapid development. It may show itself in some special direction, as in the case of the born musician, artist, or poet, or as exceptional advancement in intellectual power as a whole, as in more than one instance of famous savants. In the latter case a proportion of famous men were remarkable in youth, if not in childhood. At the same time precocity is no guaranty of lasting intellectual powers, as rapid development seems to mean in many cases arrested development. Hence the low opinion held of precocity by classical as well as by modern writers. Enough has been said to show the special attention required in dealing with the precocious child. As something exceptional, he cannot easily be fitted into rules and methods intended for the average mind.

The educator must recognise intellectual forwardness, and not attempt to force superior abilities into a too narrow and cramping mold. At the same time he must be alive to the dangers of a rapid mental and cerebral development, and distinctly discourage a clever boy or girl from such a rate of advance beyond the standard of his other years as would be detrimental to his health, to his physical powers, and so to a healthy and prolonged process of mental improvement.

**Psychology.**—Mental science, or psychology, is the science which has for its special subject-matter the various activities which make up our mental life. As dealing with the phenomena of the inner world of mind or "consciousness," it stands in contrast to the physical sciences, which have to do with those of the external, material world. At the same time, psychology holds a close connection with one branch of physical science; *viz.*, *physiology*.

We have to study mental phenomena not only in themselves as we observe them directly in our own minds, or indirectly through their outward manifestations in the minds of others, but also in connection with their physiological accompaniments and conditions, that is to say, the brain and the nervous system as a whole. It thus will be seen that psychology is the chief source of the principles or laws which make up the science or theory of education.

Since the educator has to work on the mind as his material, he requires to understand its inherent properties and the laws by which it is governed. The successful training and de-

veloping of the mind in any direction depends on our satisfying the necessary conditions of mental growth. The exercise and improvement of a child's memory can only take place by a fulfilment of the natural laws of memory (interest and association). Hence a knowledge of these laws is indispensable to one who would carry on the work of training minds intelligently, and with the assurance of following a right method.

The science of psychology deals with mind in each of its three principal phases, *knowing or intellect, feeling or emotion, and activity or will*. And the special laws of each of these great departments of mental life furnish the basis of a corresponding branch of education; viz., (1) intellectual education, the culture of the feelings, or æsthetic education; and (3) the development of the will and character, or moral education.

**Recitation.** In American colleges and schools, denotes the rehearsal of a lesson by pupils before their instructor, or the repetition of something committed to memory.

The manner in which a teacher should conduct the daily recitations of his class is a matter of very great importance, since apparently perfect recitations may be gone through with which only have little educative value, but may even be productive of positive harm to the mind of the pupil. The surest guide, in this respect, is that which is derived from a consideration of the essential meaning of the word education, no method of recitation having any value which does not keep constantly in view the development of the pupil's mental power. It should always be remembered by the teacher that the supreme object of the recitation is to accustom the pupil, by daily practice, to use the faculties of which he is so abundantly supplied.

Many a so-called recitation results, by too much explanation on the part of the teacher, in a reversal of the functions of the teacher and his class. The teacher recites to the latter, instead of the latter to the former. The passive attitude of mind in which pupils listen to a long explanation is the very attitude from which they need to be aroused.

There are two stages in the development of a mental power as produced by the exercises of the classroom—(1) the knowing what to say, and (2) the saying what is known. The first stage the pupil is supposed to have reached by the study of the lesson; the second, and most important one, is not passed through by the pupil in the case above supposed.

Of far greater service is it, therefore, to the pupil, to be allowed to state the result of his study in his own language, halting and imperfect though it be, than to compel him to listen to an exposition by the teacher. Under the first condition, it will be apparent, at every step, whether he really understands his lesson; and, if he does, every day will add to the confidence of his intellectual progress, and his ease of mental action, and give to his recitation its highest educative result; while, under the second—the condition of a "passive recipient"—there will be no opportunity for every discerning person an inexact apprehension of the thought presented, a certain degree of insincerity, strengthened into a mental habit through fear of ridicule, and mental powers "rusting in disuse."

The first requisite for skillfully conducting a recitation is a thorough preparation by the teacher for the particular lesson he is to teach, so that he may be able to follow each step taken by the pupil, and may stand ready, at any moment, to supply the needed word in which the pupil is unable to embody his thought. Another point to be remembered is the order in which the different parts of a subject are presented. Where these parts depend upon each other, the natural order is to be followed frequently do, a skillful teacher will so order the recitations of a class that each other step of the subject which are the natural stepping-stones to one another, shall be presented first, such an arrangement conducting powerfully to a correct comprehension of the subject as a whole.

In some studies, as in the natural and exact sciences almost always—this method is absolutely necessary; but, while in other

branches its value is not so apparent, the advantage to be derived from its adoption is generally considerable.

A thorough comprehension by the pupils of the subject under consideration will insure the maintenance of three other conditions necessary to success in teaching, and usually quite strenuously insisted on by writers on the subject; namely, *animation, attention, and a natural tone*. When pupils understand what they are reciting, their attention and animation are, by that fact, made certain; and a natural tone is almost inevitably adopted. In youth, the appetite for new truths is so eager, the exultant feeling which accompanies the conquest of difficulties is so keen, that the reflection of this in the voice and manner of the pupil is a matter of certainty.

**Religious Education** is that which has for its special object the cultivation of that faculty of the human soul by means of which it is enabled to realise the existence and constant presence of the Deity; to know Him, and to commune with Him in worship and prayer. Some have designated this the *religious sentiment*; but strong exception has been taken to that term, as belittling the basis of religion in the human soul.

An experience of human nature, in its various degrees of culture, shows that there are what may be called religious institutions, common to all minds of whatever grade of development; but that while these may prompt to worship, yet, without religious instruction, they can lead only to superstitious and debasing practices.

The religious or spiritual instinct does not necessarily involve any act of the intellect; for those whose intellectual education and development are quite inferior often show a surprising degree of spiritual insight and religious fervor. This fact, however, does not supersede the necessity of appealing to the intellect in imparting a knowledge of those religious truths which are communicated by divine revelation; but, in receiving these truths, the intellect assumes the attitude of faith rather than of inquiry; that is, it receives them as having been communicated by the authority, or the authority, of the source whence these truths, or dogmatic teachings, emanate, it does not exercise its powers to establish their validity, or to determine their truth in their true import and relations. Hence the intellect is not to be cultivated by means of religious instruction, although its exercise cannot wholly be dispensed with.

The specific office of religious education is thus twofold—(1) to cultivate the religious instincts, and (2) to impart religious truth. The one is accomplished by means of devotional exercises; the other by dogmatic teachings.

In the first stage of religious education, appropriate exercises constitute almost the only agency of instruction, and the religious truths being requisite (such as are usually contained in the catechism); but, in the more advanced period of culture, the imparting of dogmatic instruction becomes simple. Simple prayers and hymns, with just enough teaching to enable the child to realise their full significance, are the usual and the most effective means of exercising the religious faculty.

It must, however, be borne in mind that the mere saying of a prayer, or the singing of a hymn, will not suffice, unless the exercise, any more than merely committing to memory a definition or a rule will exercise the intellect. The mechanical repetition of prayers, in religious education, is just as useless as rote-teaching in intellectual education. By an inattention to this principle on the part of parents and religious teachers, many a child, as he grows up, comes disgusted with religious devotion, while others imbibe the notion that religion is only a matter of forms and ceremonies, or the repetition of dogmatic teachings. In such a case, the religious instinct becomes dormant for the want of due exercise.

The relation of moral and religious education should be carefully studied. In the latter may be found the former, and the relations which mankind sustain to each other;

and the latter, with those which man as a spiritual being sustains to the Infinite Spirit, the creator and preserver of all things. In the one, the principle addressed is that of conciliar precept. For right, in the other, it is the religious principle, the spiritual instinct, by which man is brought into communion with his Creator.

In a certain sense, these two departments of education are independent; for conscience operates independently of religion; but a religious sanction is the strongest foundation for moral precept. For right, in the other, it is the religious principle, the spiritual instinct, by which man is brought into communion with his Creator.

In imparting religious instruction, the same principles are to be applied as in intellectual education, as far as language is the vehicle of the instruction. Very much of the religious teaching given in the Sunday-school is of no value, because of the neglect to observe these principles. Committing to memory formulated dogmas, verses from catechisms, doctrinal lessons, etc., without any proper appreciation of their significance, can be of little service, and in some cases may do positive harm. Oral instruction plays a most important part in this kind of teaching; and Bible expositions, when clear, definite, and illustrative, always prove the most effective as well as the most attractive means of instruction.

**Rhodes Scholarship.**—The Cecil Rhodes, British statesman, who died at Cape Town, South Africa, March 26, 1902, directed in his will dated July 1, 1900, that a part of his fortune, estimated at \$10,000,000, should be applied to the creation of a fund, for the support of a certain number of scholarships covering a three-years course at the University of Oxford. He directed that the selection of the recipients of this gift should be made two from each state and territory of the United States, or one hundred in all, fifteen from Germany, and from one to nine from each of the British colonies.

In most of the states the selection is made by a committee appointed by representatives of the colleges; in some the appointments are made in rotation by the leading colleges.

The conditions regulating the award of scholarships in the United States provide that the candidates shall have satisfactorily completed the work of at least two years in some college of liberal arts and sciences. Except under extraordinary circumstances the maximum age limit must be twenty-four years at the time of entering upon the scholarship at Oxford. To be eligible the candidate must be a citizen of the United States, or the son of a citizen, and must be unmarried. Each student receives an allowance of \$1,500, payable in quarterly installments, which is just enough to enable him to pay his college fees and necessary expenses.

At the beginning of Michaelmas term, October, 1904, there entered Oxford twenty-two Rhodes scholars; forty-three were American, and twenty-seven were English. In 1906, the full number, 120 in all, were in residence, and thereafter this number was to be maintained, the vacancies being filled as men were graduated. The first examination in the examination in the United States took place in January, 1911. There will be examinations also in 1913, 1914, and so on, omitting every second year. The number of examinations are not competitive, but qualifying.

**Scholasticism**, a name generally applied to the Christian philosophy of the middle ages, though there is no agreement among scholars as to its exact definition. In its first period, which extends from the ninth to the twelfth century, it was confined to theological problems. Among the greatest representatives of scholasticism are Scotus Erigena, Gerbert (Pope Sylvester II), and Albertus Magnus. About the middle of the thirteenth century the controversy between the *Realists* and

**Nominalists** led to the full development of scholasticism, which denied to philosophy any right to extend its speculations beyond the tenets of the church, but assigned to it the task of systematizing the doctrine of the church, and of defending them. Thus, the scholastics were led to cultivate chiefly logic and dialectics.

Among the greatest scholastics during the classic period of the system were Alexander de Hailes, Albertus Magnus, Thomas Aquinas, and Duns Scotus. In the fifteenth century, scholasticism began to decline; and, though subsequently the scholastics tried to revive it, and have partly retained its method of teaching to the present day, it has never been able to recover anywhere its mediæval supremacy. Its importance in the history of education depends chiefly on the influence which it exerted, during the middle ages, upon all schools, but more especially upon the cathedral and convent schools.

**School Management** is a department of the teacher's profession which includes (I.) the organization of the school, and (II.) its conduct. Under the former, must be considered (1) the *classification*, (2) the *distribution*, as to order and time, of the branches to be taught (course of instruction, or program), and (3) the proper *assignment* of the work of instruction (in a graded school) to several teachers, either in accordance with the class system or with the departmental system.

The conduct of the school has reference (1) to instruction, and (2) to discipline. Great care should be taken, by means of a carefully constructed program, or daily order of exercises, to secure to each subject its proper amount of time, according to its place in the course of instruction, as well as to insure an equitable advancement on the part of the pupils in the study of the grade, as preliminary to promotion.

The promotion of pupils is a matter of great practical importance in the management of a school. One of the chiefest errors made by teachers is the too rapid advancement of their pupils. Promotion should always be based upon a careful examination; and, in a graded school, care should be taken that every pupil is passed through a legitimate manner—that is, without hurry or cramming. When the school is ungraded, the advancement of individual pupils is to be considered; there is the natural and legitimate tendency, so as to secure thorough proficiency as the basis of promotion.

Government is, also, an important department of school management; since, without efficient government, all attempts at effective school instruction must be fruitless.

**Self-Command, Self-Control.**—These terms refer to the higher exercise of the will in restraining and controlling the natural impulses and propensities. Thus, when a child makes an effort to abstain from a forbidden action, or to master a feeling of anger, it is exercising self-control. This self-regulation shows itself in three directions, answered by the three directions of control, viz., the control of the thoughts, of the feelings, and of the actions.

The perfect control of the whole mind by a good and rational will is the highest result of mental development, and should be the end of education. Such complete self-mastery involves a firmly fixed habit, the establishment of which is a long and difficult process, especially in the case of impulsive and passionate children. The educator must early begin to exercise the child's will in an effort at self-command. Thus intelligent instruction should be accompanied by attention, a restraint of the impulses to bodily movement and wandering thoughts.

Again, the moral educator has from the first to encourage the child to control his feelings, and more especially to govern his temper. The moral educator is further concerned with the development of that species of self-control which consists in denying ourselves the satisfaction of our own desires, an exercise in which the principle of all virtue and excellency lies.

**Self-Education** is that part of the work of mental development which the individual

carries out for himself. It is a necessary supplement to the early school education, in which the learner is surrounded by external incentives and aids.

What, however, is it customary to divide the process of education into these two stages, it must not be forgotten that the underlying motives of self-education—the desire to gain knowledge and to improve character—must be as potent as those of the child's intelligence and will are sufficiently developed to enable it to appreciate and cooperate with the teacher's aims. The child must be able to follow the course of study in later years by the independent exertions of the pupil, just because the desires and aspirations which prompt to and sustain self-education have not been developed. Thus the methods of intellectual instruction adopted have not succeeded in kindling a love of knowledge which would burn on when the years of school were over.

In a certain sense all education is self-education. The acquirement of knowledge is made, the power to use knowledge—to think, to feel, and to will—is developed by, and in proportion to, the activity of one's self. The term, however, is generally applied to some of the different series of the acts of person who, having passed the usual school age, finds himself without the means of external help and guidance, and seeks by his own unaided or but slightly aided exertions to continue or to commence his education.

Now, what is the service which a skillful teacher renders to a learner? He selects the subjects to be studied, and the parts of each subject; and he guides him so that he shall follow part, and subject subject. He chooses the method or manner of study—so that the right faculties shall be exercised—and by his wide knowledge and constant presence he exhibits and maintains a living connectedness not only between the parts of each subject, but also between the subjects themselves. He guides and stimulates the learner to make use of, and to test by use, the knowledge acquired; and is ever on the watch to regulate and direct exertion, to supply explanations where needed, and to recall the learner's attention to any knowledge which seems likely to slip away.

This service of the skilled teacher is of vital importance to the younger beginner; but, except in suggesting connectedness and in general guidance and stimulation, it tends to grow of less and less importance as the learner himself grows in knowledge and in development of power to use knowledge. To one who has been properly educated during the school period it would seem sufficient to give advice, following as nearly as may be the practice of the teacher.

(1) Do not choose too many subjects.  
(2) Select in preference first subjects of which you already know something and which have a bearing of some kind on the work of your everyday life, and then those which are new and out of these.  
(3) Having ascertained from some competent authority the best text-books, seek to master the main points first, and fill in the lesser matters later.

(4) Consistently test your knowledge by employing it in every available way—not only knowledge newly acquired, but also old knowledge with it—and, when the chance offers, test it at times by its amount and readiness also by entering some good public competition.

(5) By every means in your power maintain a connectedness in all that you learn; do not let old knowledge slip away, and always endeavor to gain knowledge by personal experience rather than at second-hand; always try to see how the new knowledge just gained affects what you already know.

(6) Ally yourself with other students when you can, although their subjects may not be yours. What they learn and care about will prove unexpectedly useful to you with regard to your own knowledge; and community in study is always stimulating and refreshing.

(7) Lastly, remember that the best education is one which enables you to live out your

life effectively in many directions, and does not consist in the mere accumulation of facts; it is the result of well mingled knowledge which you know how to employ, and is not the knowledge itself.

A person who has had no school education is now so rare a being that it seems hardly necessary to offer him advice. This, however, may be said: Choose some object of observation such as you have the best means of studying practically; and work from it as a center gradually outward in different directions, never losing the connection with your central subject; observe, classify, experiment, reason, and then again observe.

Your best central subject will be one of the following: botany, natural history, physiography, or perhaps geology, or not at any rate for some considerable time, attempt to make any but your central subject a special study; and follow up your other subjects which branch from it simply for the sake of that central subject.

**Selfishness, Self-Love.**—By self-love or self-regard moralists indicate that instinctive concern for one's own safety and happiness which is common to all men. This feeling has its roots in the impulse of self-preservation which is necessary to the conservation of individual life, and which, in an articulate or an inarticulate form, is an endowment of all sentient creatures. When this feeling exists in moderation, and does not render the subject of it callous to the interests and needs of others, it is spoken of as rational self-love. When, however, it is excessive, leading to an insatiable passion of the thoughts and desires about personal interests and to the disregard of others' happiness, it becomes what we all know as selfishness.

Selfishness is commonly said to be a characteristic of childhood. Children are apt to be greedy, insatiable in their demands, jealous of other children, indifferent to the trouble any cause them, and ungrateful and so forth. Such childish selfishness is to be explained by the circumstance that social feelings are later in development than the egoistic. The appearance of selfishness in a young person arises from a suddenness and weakness of the sympathetic feelings must be distinguished from that more baseful form of egoism which is apt to show itself in certain children later on, and which is based on a preference of self to others. In dealing with the child's egoistic feelings the educator must not seek to uproot them, but, recognizing the valuable and necessary element in them, aim at making this the basis of a reasonable regard for self and a sense of personal worth. The tendency to selfishness must be early corrected, before it hardens into a habit, by drawing out and educating the love and sympathy of the children. If children are selfish they are mostly disposed to be affectionate if only the educator can discover the way of touching and drawing out the love.

**Slater Fund.**—In 1862 Mr. John P. Slater of Concord, N. H., gave to the State of Massachusetts the sum of \$1,000,000, for the purpose of "uplifting the lately emancipated population of the Southern states and their posterity." For this purpose the sum was divided into three parts. The first part of \$300,000 was voted, and a medal was presented. Education in industries and the preparation of teachers are promoted in institutions believed to be on a permanent basis. Schools established by states, denominations, and individuals are helped by annual donations. Among the more prominent are the Hampton normal and industrial school, the Hampton University, Fisk University, Tuskegee institute, and schools at Tougaloo, Miss.; Raleigh, N. C.; New Orleans, etc.

**Smithsonian Institution**, a learned institution in Washington, D. C., established in 1846, "for the increase and diffusion of knowledge among men," by James Smithson, a natural son of Hugh Smithson, first duke of Northumberland, through a bequest of \$515,169, subsequently increased by a legacy left to \$515,169. The legacy, having been bequeathed to the United States,

was formally accepted by Congress, and the institution established by an act approved August 10, 1849.

The government of the institution is intrusted to an establishment consisting of the President of the United States, the Vice-President, the members of the Cabinet, and the Chief Justice, in addition to which there is a Board of Regents composed of the President of the United States, the Chief Justice, three members of the Senate, three of the House of Representatives, and six citizens selected by Congress. The executive officer is the secretary of the institution, who is elected by the regents.

The objects of the institution, as defined in the original plan by the first secretary, are, first, to increase knowledge by original investigation and study in either science or literature; and, second, to diffuse knowledge not only through the United States but everywhere, especially by promoting an interchange of thought among persons prominent in learning in all nations. This general proposition was more specifically defined as follows: "To assist men of science in making original researches, to publish them in a series of volumes, and to give a copy of them to every first-class library of the five parts of the earth." Scientific investigators in the United States, as well as those abroad, have been aided by the institution. Books, apparatus, and laboratory accessories have been supplied to thousands, and a number of money grants have been made. Personal encouragement has been afforded, advice given, and thousands of letters written in response to inquiries.

The publications are numerous and include memoirs on archeology, astronomy, ethnology, botany, zoology, geology, paleontology, meteorology, physics, physiology, and philosophy, and many other branches of investigation.

In 1891 the funds of the institution were increased by a bequest of nearly \$250,000 from Thomas G. Hodgkins, and with other additions, the total permanent fund amounts to \$897,000 deposited in the treasury of the United States. The income is about 6 per cent under special congressional provisions. The institution has its home in a building of Seneca brownstone in the Norman style of architecture, erected on the Mall in 1847-55.

Under the fostering influences of the Smithsonian Institution a number of dependencies have grown up, which are supported by appropriations by Congress, the secretary being the *ex-officio* chief of each. These are:

(1) The *Bureau of Exchanges*, begun in 1850, which has for its object the free interchange of scientific material between scientific institutions, the correspondents of which number upward of 48,000.

(2) The *National Museum*, the depository of the national collections. It is especially rich in the natural history, geology, paleontology, archeology and ethnology of America, and has unique collections of American history, as well as many specimens relating to fine arts and the industrial arts. It is both an educational and a research museum, and issues numerous technical and popular scientific publications. The National Gallery of Art consists largely of the collections of etchings and engravings of George P. Marsh; the collections of Charles L. Freer, containing numerous paintings and etchings by Whistler, and examples of Chinese and Japanese art; the Harriet Lane Johnston collection, including a number of the greatest English portrait painters; and the collection of William T. Evans, of one hundred paintings representing some of the best work of American artists. A new building, for which \$3,500,000 has been appropriated, is in course of construction.

(3) The *Bureau of American Ethnology* is an outgrowth of researches beginning early in the history of the institution, which has from the outset devoted attention to the native American tribes. It began its formal existence in 1879, under the directorship of John W. Powell, who was succeeded in 1902 by William H. Holmes.

(4) The *National Zoological Park* was established in 1890 for the purpose of securing the preservation of such American animals as are upon the verge of extinction. It occupies 167 acres north of the center of the city of Washington.

(5) The *Astrophysical Observatory* was established in 1890 for the purpose of carrying on investigations in astrophysics, especially with regard to the invisible portions of the spectrum of the stars.

**Sympathy** is a feeling with, or a sharing in the feelings of others. Sympathy is a representative feeling, that is, a feeling which depends on the imaginative representation of a state of mind not actually experienced at the moment. As such, it presupposes a certain amount of personal experience of pleasure and pain.

The want of sympathy which is so often ascribed to children is explained by the limitation of their experience, their inability to realize states of feeling different from their own, and their preoccupation with personal interests and pursuits. At the same time, the germ of sympathy, *viz.*, the tendency to reflect others' feelings, is plainly seen in the readiness with which they are excited to laughter or tears by examples and contagion.

This tendency has a high educational importance. It is by the contagious propagation of feeling that the teacher's cheerful manner induces a willingness to learn in the pupil. The advantage of teaching children in numbers rather than alone depends on the sympathy of numbers, which is merely another expression for the capacity for the young to take on the mental attitude of those by whom they are surrounded.

The higher kind of sympathy or fellow-feeling, which implies, not only a sharing in the feelings of others, but an understanding of them as one chief element in moral development. Where there is affection between teacher and pupil, and the disposition to sympathize with the impulses, not only of the child, but of the happiness promoted, but a powerful motive is supplied to effort and industry. The sympathetic child finds it a pleasure to do what the teacher knows to be right, and to do it to do. Hence the importance of the teacher's drawing out the affectionate impulses of the child, by manifesting on his side a loving sympathy and interest in the latter's welfare and happiness.

The impulse of sympathy is, further, that on which the moral educator must ultimately rely for the correction of the selfish propensities of children, as shown in greediness, envy, cruelty, and the bitter feeling of rivalry. Since it is agreed that duty consists essentially in a recognition of the interests and claims of others, it is evident that virtue, or the fixed disposition to the right, must have its chief root in a wide and impartial sympathy. Hence the moral importance of cultivating the sympathetic feeling of children, first of all in relation to their immediate associates, human and animal, and then in relation to wider and wider circles, those of other social grades, other races, and so forth.

**Teachers' Institute**, the name given, in the United States, to a assemblage of teachers of elementary or district schools, called together temporarily for the purpose of receiving professional instruction. Such meetings are held under the direction of the school authorities, usually the state, county, or town superintendent, and quite often there is a provision of law requiring the teachers employed in the common schools to attend, and permitting a continuance of their salaries during the absence.

A teachers' institute is usually conducted by an experienced teacher having special skill for the work. This requires a good knowledge of the practice and theory of teaching, especially as applied to the ordinary branches of common-school education; it also needs ability as a lecturer. Teachers' institutes are designed to be either supplementary, or as complementary to, normal instruction, and as such they constitute a valuable agency in connection with a system of common-school instruction.

**Temper.**—This term, which originally meant a due mixing of elements, refers to the constitution as a habitual disposition of the mind on its emotional side, or to its emotional complexion. Thus we speak of a violent, an irritable, a calm or equable, and a good or cheerful temper.

The difference of temper which characterizes individuals are in part due to physical and constitutional causes. A strong and healthy physique is a basis for a good temper. Disturbances of health affect the temper in all cases, and lasting physical suffering may sour it for life. On the other hand, temper is to a large extent a subject of control by the will. This control grows older and governs our moods by suppressing feelings of annoyance and anger, and also in cultivating a cheerful and hopeful frame of mind.

The educator is concerned with the management of temper both in himself and in his pupils. The art of ruling others presupposes self-government as one of its prime conditions. Anything in the shape of violence or morbid irritability of temper is fatal to the discharge of the teacher's function; for though it is well for the educator on occasion to be angry, and to be so, it must never be carried away by his passion.

The exercise of the child in the government of its temper forms one important part of its early moral education. Since the child is as a rule liable to be overcome by strong passion, and since its will is at first weak in resisting and overcoming this, the parent and the teacher should do the utmost to stimulate it to make an effort to govern its passions. Locke and Rousseau contend passionate crying should be cured by firmly refusing to grant the child's wishes under these circumstances. As the child grows older appeal must be made to its intelligence and its better feelings, in order to induce it to control its feelings of discontent and anger.

**Temperament** is the permanent of a person we understand his natural complexion or bent of mind as fixed by the temperament of the mind. The common division of temperaments is a fourfold:

- (1) Sanguine (full-blooded), warm, impressionable, and changeable in its moods.
- (2) Phlegmatic (with abundance of phlegm), calm, deliberate, and persistent.
- (3) Choleric, with a strong, energetic, and prevailing objective attitude.
- (4) Melancholic (with black bile), sentimental, with tendency to subjectivity.

This fourfold division has been handed down from ancient times, and, as its terminology suggests, is based on a crude and obsolete notion of the physical basis of mental dispositions. Nevertheless it has been used as the starting point in recent attempts to classify the leading facts of temperament.

It is now recognized that the manifold individual differences of mental constitution are very incompletely described by this scheme. Ingenious attempts have been made by recent writers to group these by combining the four leading types in various ways. A truly scientific classification of mental peculiarities must set out the radical psychological distinctions. Thus we have a well marked contrast between temperaments in the emotional or sensitive and the intellectual or objective.

With respect to the precise physiological basis of these differences science is as yet able to tell us very little. We know that intellectual differences, as in respect of the power of discrimination, or of vividness and revivability of impressions, are connected with peculiarities of the brain and sense organs. We also know that the emotional or sensitive temperament is correlated with special vigor of the muscular system and the motor side of the nervous system as a whole. A thorough understanding of the leading types of natural disposition, with their physical counterparts, is greatly needed by the educator as an aid to an intelligent classification.

**Truthfulness, Untruthfulness.**—Truthfulness or veracity has been regarded by moralists generally as one of the cardinal virtues. A scrupulous truthfulness, including the abhorrence of a lie, is one of the highest

results of moral education. Lying is a common vice among children, as it is among backward races of mankind. It is very doubtful, however, whether it is a natural propensity which tends to display itself in all cases independently of circumstances.

Much of childish inaccuracy of statement is not, strictly speaking, untruthfulness—that is, conscious falsehood—but is explained as the result of imperfect knowledge of words, and of a vivid imagination which momentarily confuses fiction and reality. A child properly brought up seems rather to show an instinctive shrinking from falsehood, and only lies as the result of an effort.

The habit of untruthfulness may be induced not only by the bad example of untruthful companions, but by errors on the part of the parent or preceptor. Thus, want of strict accuracy from a polite wish to please others may first suggest untruth to the child's mind. Again, a child may be wrongly and foolishly accused of lying, and so the idea of falsehood be forced on its attention. For the most part, the educator should be careful not to force and hurry a child into lying, when the temptation is great and likely to be overpowering, and especially not to terrify a child into untruth, but to encourage it to be perfectly open, even when it is likely to confess. When a lie has been clearly detected, it is a proper subject for punishment, and care must be taken to make this adequate, as to correct the weakening effect of the first lie on the habit of truthfulness. Here, however, care is necessary.

Lies differ greatly in turpitude according to their motive, and the list that springs from fear of punishment ought not to be viewed as heavily as one arising from a desire to gain an advantage over another, to involve another in trouble, and so forth. Much care should be taken by the mother not only in her own use of words, but in the selection of companions, so as to accustom the little one at the outset to the habit of truth, as something normal and admitting of no exception; and as the child grows, to desire of the home, the school, and of the playground should combine to develop a feeling of hatred and contempt for falsehood as something essentially mean and cowardly.

**University**, a corporate body or corporation established for the purposes of instruction in all or some of the most important branches of literature and science, and having the power of conferring certain honorary dignities, termed *degrees*, in several faculties, as arts, medicine, law, and theology. In most cases the corporations constituting universities include a body of teachers or professors for giving instruction to students; but this is not absolutely essential to a university, and London University, for instance, was long merely an examining body.

In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either a body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either according to the faculty to which they were attached, or according to the country to which they belonged.

At a later period the expression *universitas literarum* (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be taught in these establishments, and in some, forming the notion of a university from the universities of Oxford and Cambridge, suppose that it necessarily means a collection and union of colleges, that it is a great corporation, comprising in one certain smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in these and such universities there are no foundations which bear any resemblance to the English colleges.

Oxford and Cambridge differ from most universities also in the fact that, though they possess a body of professors, little of the teaching falls to be done by these. The oldest of the European universities were those of Bologna and Paris, and these formed the models

on which most of the other early universities were established, a papal bull being generally regarded as necessary to this.

The United States possesses the largest number of institutions bearing the name of universities, but a large proportion are sectarian, and many represent only a single faculty.

**University Extension** is the offering of a systematic course of instruction by a limitation of higher learning through its professors to audience and classes beyond the local bounds of the university itself. This idea of popular education, through the agency of university professors using university methods seems first to have taken root on English soil in the University of Cambridge in 1872.

The plan, however, did not spring from the university, but was rather originated by certain mechanics, institutes in the manufacturing towns of Leeds, Birmingham, and Nottingham, which presented memorials to Cambridge, requesting that university to offer instruction in those towns for the benefit of working men. In accordance with this request, the University of Cambridge offered courses of lectures in three different centers in the following year, 1873. The plan was popular in England from the first, and the work has constantly grown in importance ever since.

Though the work was begun in a somewhat haphazard way, the experience of the first few years shaped a well established university extension method, which has continued with slight modification even to the present day. The method involved:

(1) An extension center, under local management, whose function it was to secure a local body of students, provide suitable rooms, guarantee expenses, etc.

(2) A course of lectures by a university instructor, the standard being a course of either six or twelve lectures, according to circumstances. The instructor provided printed copies of his lectures for the use of his students.

(3) Libraries embracing the necessary books for the use of students in the class were provided either by the local center or by the university.

(4) A public session, in which the lecture was delivered to the general audience, immediately followed by a session for the benefit of the students, was pursued with great intensity, at which opportunity for questions and discussion of the lecture was given.

(5) Theses, weekly or at some other stated interval, written by the class upon topics proposed by the instructor, and corrected by him.

(6) A written examination, participated in by those who desired to obtain a certificate of credit for the successful completion of the course.

The extension of popular education through systematic lecture courses was not inaugurated in the United States by any college or university. Its first public advocacy seems to have been made by the late Professor Herbert B. Adams, of Johns Hopkins University, before the American Library Association, in 1887. Three years later, in the fall of 1890, the first organized movement toward the realization of these plans was made by the organization in Philadelphia of the American Society for the Extension of University Teaching.

In 1892, with the opening of the University of Chicago, a University Extension Department was established as an integral part of the university, with an office secretary and a select staff of lecturers whose entire time was devoted to the work of lecturing. Here was the first university extension, in the strict sense, in the United States, corresponding to the type developed in Cambridge and Oxford—that is, a university officially undertaking to extend its instruction beyond its own walls.

The example of Chicago has been followed by other universities in the United States, notably by Columbia, University of Wisconsin, Pennsylvania State College, and the University of Wisconsin.

**Vanity, Pride, Self Esteem**.—These terms refer to varieties of feeling which have a common root in self-love and self-regard. The

child instinctively attaches a value to all that concerns itself, and when a distinct consciousness of self is developed this instinctive disposition passes into a sense of self-love or self-attention, which is analogous to its love for others. At first, owing to the weakness of their judgment, children are disposed to estimate themselves and their actions by the opinion of others. Self-regard is at this period largely the reflection of others' complacency.

The most general name for this dependence on others' approval is the love of approbation. It is at once the source of one of the most valuable motives of childhood and of one of its greatest weaknesses. Kept within proper bounds, and rendered intelligent and discriminating, this regard for others' opinion is one of the educator's principal aids. On the other hand, when unchecked and undiscriminating, it grows into a foolish and hurtful vanity; or love of admiration. Vanity involves an excessive self-consciousness, an over estimate of some personal quality, as good looks, and a too eager desire for others' admiration. This vanity is one of the most conspicuous in ambition and thirst for glory, though here another impulse, viz., emulation, cooperates.

A child must be cured of vanity by withdrawing all inordinate praise; by associating it with the faults of others, that they may learn its defects and points of inferiority; by cultivating its affections and its intelligence, and so developing a certain selectiveness in the enjoyment of praise, and a power of discriminating empty flattery from just recognition of worth; and, finally, by exercising and strengthening it in self-judgment and self-esteem.

As the child grows to the age of independence it must learn to rely less on others' good opinion and more on its own. This self-esteem is necessary to the higher development of the child, and the educator chooses right independently of the value set on it by others, implies that the subject finds an adequate reward in the feeling of self-approbation. A proper feeling of self-respect, or pride, which leads to self-respect, is small, mean, and tricky as unworthy of him, or beneath his dignity, is one of the most valuable of moral safeguards. In encouraging this self-esteem and this sense of personal dignity the educator must be careful not to foster an excessive and cynical disregard for others' approval, which is a blemish in all cases, and in the case of the young is particularly baneful.

**Voice**, the name given to the result of the production of sound in nearly all higher vertebrate animals. Speech is a modification of "voice."

In the man the voice is produced by the *inferior laryngeal ligaments*, or *true vocal cords*, as they are termed. The vocal cords consist of two elastic folds of mucous membrane, so attached to the cartilages of the larynx as to be drawn together by the contraction of relaxed or otherwise altered so as to modify the sounds produced by the vibration. The higher the note produced the greater is the tension of the cords; the range of voice therefore depends upon the amount of tension which the cords can undergo.

From the age of six until nearing the period of puberty the larynx is approximately similar in size in both sexes; but in adults the larynx is about a third larger in males than in females, and the male voice is generally an octave lower in pitch than the female.

Regarding the compass and application of the voice in speaking and singing, physiologists have noted three kinds of sequence. In ordinary speaking a monotonous sequence is observed, the notes having nearly all the same pitch, and the variety of the sounds being about a third larger in males than in females. This is due to definite movements of the glottis and vocal cords.

A passage from high to low notes, without interval, forming second kind of sequence, or the same sequence is observed in the passage from low to high notes. Such a sequence is exemplified in crying and howling both in man and in lower animals.

# ARTS AND SCIENCES

**HISTORY.** Universal history is usually treated in three principal divisions:

**I. Ancient History**, which begins with the earliest written records and terminates A. D. 476, with the destruction of the Roman empire.

**II. The Middle Ages**, which extend from the fall of Rome, A. D. 476, to the discovery of America, A. D. 1492.

**III. Modern History**, which commences at the latter epoch, and continues to the present time.

The events which mark the separation between the *first* and *second* periods, are the irruption of the Teutonic tribes, the consequent fall of the western Roman empire, and the foundation of the modern European states; between the *second* and *third*, are the extension of learning by the invention of printing, the taking of Constantinople, the maritime discoveries of Spain, Portugal, and other European countries, with the more extensive use of firearms.

**I. Ancient History** may be subdivided into six periods:

1. The nebulous period, comprising the fragmentary accounts of the early Assyrians, Babylonians, Egyptians and Hebrews, down to 2000 B. C.

2. The Mosaic period, from the time of Abraham to 1200 B. C., during which Moses promulgated his great code of moral and political laws.

3. The Assyrian-Babylonian period, which witnessed a long series of Assyrian conquests, the zenith of Babylonia, the rise of Greece and Rome, and the foundation of the Persian empire,—1200 to 529 B. C.

4. The Persian-Macedonian period, from 529 to 323 B. C., during which both the Persians and the Greeks reached their greatest achievements.

5. The Greek-Roman period, from 323 B. C. to the Christian era, saw the decline of the Greeks and the coming universal power of the Romans.

6. The period of the Roman empire, from the time of Christ to 476 A. D., was notable for the foundation of Christianity, Christian persecutions, the division of the empire, Roman luxury and corruptions, and the incursion of the Teutonic hordes.

**II. The Middle Ages** may be treated in the following six periods:

1. *First*, the foundation of the modern states of western Europe, A. D. 476–622, when the Saxons invaded Britain, A. D. 449; the Visigoths settled in Spain, A. D. 507; the Ostrogoths in Italy, A. D. 489; and the Franks began the formation of the French monarchy, A. D. 481.

2. The *second* comprehends the age of Mohammed, with the propagation of his creed, and the establishment of the states which embraced his religion, to the treaty of Verdun, A. D. 622–843.

3. The *third* embraces the period from the treaty of Verdun, when the empire of the West was divided, to the Dark Ages, 843–936.

4. The *fourth* is the interesting period of the Dark Ages, A. D. 936–1096, during which the monarchy of Charlemagne fell to ruin, the Capetian dynasty began to reign in France, Italy was parceled out among a number of petty princes, while in Germany, Otto commenced the long-continued struggle against feudalism.

5. The *fifth* is the romantic or heroic period of the Crusades, A. D. 1096–1273, in which the Roman legal code, the foundation of modern jurisprudence, began to be studied.

6. The *sixth*, from 1273 to 1492, beheld the revival of the fine arts in Italy, the taking of Constantinople and diffusion of its learned men, the revival of letters, the discovery of America, A. D. 1492.

**III. Modern History** falls conveniently into five periods:

1. The period of the Reformation, including its commencement by Luther, A. D. 1517, till the termination of the long series of religious wars, by the treaty of Westphalia in 1648. This period produced many important changes in Europe.

2. The period from 1648 to the death of Louis XIV., in 1715, during which Russia entered European politics, and Great Britain began to assume large influence on the Continent.

3. The period from the death of Louis XIV. to the Congress of Vienna, 1815, which marked the fall of Napoleon. In this period was established the independence of the United States, Prussia advanced to the front rank of European powers, the French Revolution occurred, and the world witnessed the rise and fall of Napoleon.

4. From the Congress of Vienna, 1815, to the American Civil war, the most momentous period in American history.

5. From the close of the American Civil war to the present time, a period of unprecedented development and expansion.

## PARALLEL OUTLINES OF UNIVERSAL HISTORY

### FROM THE DAWN OF HISTORY TO THE TIME OF ABRAHAM, B. C. X-2000 (?)

CHARACTERISTICS OF THE CENTURIES	BABYLONIA—ASSYRIA	EGYPT	ARTS AND SCIENCES	LITERATURE
<b>B. C. 5000—4000</b>  Modern research shows the existence of flourishing city states in the Mesopotamian region, whose origin and growth far antedate this period. Early Babylonian and Egyptian civilisation.	5000 (?) Kengi, or Sumerians, seem to be the advance guard of Babylonian civilisation.  4500 (?) Struggles for mastery among petty Babylonian Kings. Kingdom of Shurpura dominates, with Sungir (Shinar) as its capital.  4100 (?) Dynasty of Eresh begins about this time.	5000 (?) Tombs of pre-dynastic Kings at Abydos reveal an advanced state of civilisation.  4400 (?) Menes founds the old Egyptian empire, Memphis, the capital. Animal worship becomes prominent in Egyptian life.	5000 (?) At this date many of the industrial arts had made considerable advancement both in Babylonia and Egypt.  4100 (?) Architecture in stone begun in Egypt; copper tools introduced, and artsmanship fostered.	
<b>B. C. 4000—3000</b>  Period of the pyramid builders. The Accadians flourish in the Euphrates valley.	4000 (?) Nippur becomes the religious center.  3900 (?) Agade becomes the chief center of Northern Babylonia. 3800 (?) Sargon I. of Accad, reached the Mediterranean, and conquered Elam, a kingdom east of Babylonia. 3700 (?) Babylon made capital.  3200 (?) End of the dynasty of Sargon.	4000 (?) Athothia, King.  3753 (?) Khufu (Cheops) builder of the great pyramid, reigns.  3666 (?) Khafra (Chefnen), pyramid builder, reigns. 3633 (?) Menkaura (Mykerinos), pyramid builder, reigns. (Egyptian history almost a blank until the 11th dynasty.)	3000 (?) Great Pyramid at Gizeh. The Sphinx carved.  3750 (?) Temples to the gods built by Sargon I. at Nippur and Agade.  3300 (?) Canals and irrigation in Egypt begun.	"Moral Precepts" of Ptah-hotep.

## FROM THE DAWN OF HISTORY TO THE TIME OF ABRAHAM, B. C. X-2000 (?)—Continued

CHARACTERISTICS OF THE CENTURIES	BABYLONIA—ASSYRIA	EGYPT	ARTS AND SCIENCES	LITERATURE
<b>B. C. 3000—2000</b>  Invasions of Accad and Babylonia by the Kings of Ur and the Elamites, respectively. Babylonian dominions extended. First migrations from the Aryan center; Celts move westward; Indo-Persia tribes, south. Chinese civilization evident. Flood narratives accepted, and Sabbath observed among Semites.	3000 (?) Accad under Kings of Ur.  2500 (?) Isin takes high rank among Babylonian cities, and a dynasty is founded there.  2450 (?) Arabians and Elamites erupt into Babylonia.  2400 (?) City of Babylon first rises into prominence. 2300 (?) Elam supreme in Babylonia.  2300-2250 (?) Hammurabi unites Babylonia.	3000 (?) Hierakleopolis becomes the seat of government.  2800 (?) Amenemhat I., first of the 12th dynasty.  2650 (?) Usermonte III., King, conducts expedition against Ethiopia.  2400 (?) Government moved to Thebes.  2100. Egypt conquered by the Hyksos, or Shepherd Kings.	3000 (?) Era of palace and temple building renewed in Babylonia; statues of Gudea.  2750 (?) Temple at Heliopolis built; also temple of Ostris at Abydos.  2371-25. Egyptian obelisks erected. 2300 (?) Amenemhat III. constructs Lake Maria, and the labyrinth near it. 2200. Astronomy known in Chaldaea.	Inscription of Una, found at Abydos. <i>Egyptian Book of the Dead.</i>  <i>Code of Hammurabi.</i>

## FROM ABRAHAM TO THE PERIOD OF ASSYRIAN ASCENDENCY, B. C. 2000-1200.

CHARACTERISTICS OF THE CENTURIES	HEBREWS	BABYLONIA—ASSYRIA	EGYPT	EUROPE	ARTS AND SCIENCES	LITERATURE
<b>B. C. 2000—1200</b>  Egyptian revolt from the Shepherd Kings. New Egyptian empire.  Rise of Assyria—originally settled by emigrants from Babylonia. Wars with Babylonia.  Sidon, a Phœnician city, at its zenith. Phœnician colonies established round the Mediterranean.  Advanced civilization in Crete.  Exodus of the Hebrews from Egypt under Moses.  Hittites rise to great power, contending equally with Egypt and Assyria.	2000(?) Abraham, Hebrew patriarch.  1728 (?) Joseph, Migration of the Hebrews into Egypt.  1491 (?) Moses; Exodus from Egypt.  1451 (?) Hebrews conquer the promised land, Canaan. Hebrew theocracy established.  1220. Assyria again independent.	2000 (?) Kamites (Arabians) conquer Babylonia. 1900. Assyria settled by Babylonian emigrants. Nineveh made the capital. 1700. Phœnicia conquered by Egypt.  1600. Long series of wars begun between Babylonia and Assyria.  1310. Tiglath-Adar I. conquers Babylonia. 1200 (?) Salmanser I. rules in Assyria.	(Period of great obscurity.)  1800 (?) Revolt of Thebes against the Hyksos.  1670. New Empire expands under Thothmes III.; Phœnicia, Persia and part of Asia Minor conquered. 1524-1488. Expeditions against Syrians and Ethiopians, under Seti I. 1500. Egyptus reigns, and gives his name to the country.  1333. Ramses II. wages war against the Hittites; oppresses the Hebrews. 1322. Memphis, the supposed Pharaoh of the Exodus.  1260. Ramses III.  1244-1091. Decay of the Empire under the Ramses Pharaohs.  1200. Priam, King of Troy. 1216. Second Theban war. 1213. Helen (later of Troy), carried off by Theseus, afterward married Menelaus.	2000. Celts reached western Europe. Principal settlements made in central France.  1700. Arcadians migrate to Italy.  1582. Earliest date in the Persian chronicles of Greece, preserved in the Arundelian marbles. 1504. Areopagus established.  1457. Kingdom of Mycenae founded. 1433. First Olympic games at Elis. 1400. Minos reigns in Crete.  1384. Founding of Corinth.  1356. Eleusinian mysteries instituted by Eumolpus.  1266. Edipus, King of Thebes. 1263. Argonautic expedition of Jason.  1240. Troy taken by the Argonauts. 1239. Latinus reigns in Italy. 1235. Theseus reigns in Athens for 30 years. 1233. Carthage founded by the Tyrians. 1225. First Theban war. 1220. Priam, King of Troy. 1216. Second Theban war. 1213. Helen (later of Troy), carried off by Theseus, afterward married Menelaus.	2000. Babylonian industry flourishes under the Kamite kings. Phœnicians skilled artisans.  1650. Library founded at Thebes; manuscripts transcribed.  1524-1488. Magnificent palaces and temples erected at Thebes.  1400. Babylonian language in commercial use among eastern Mediterranean countries. 1338-1322. Ramses II. builds many palaces and temples in Egypt. 1370. Bucklers used in single combat. Music and poetry cultivated in Greece.  1263. Temple of Apollo at Delphi built. Jason leads first naval expedition on record. 1240. The ax, wedge, gimble, and lever, also masts and sails for ships, invented by Dedalus of Athens.  1224. Game of backgammon invented by Palamedes, of Greece.	<i>Pentecost, a descriptive poem, in epic form.</i> <i>Thothmes III. causes chronology of Egyptian kings to be made.</i> <i>Papyrus Herodotus.</i>  <i>The Vedas of India.</i>  <i>The Amarna Letters.</i>  <i>Chinese Book of Changes.</i>

THE ASSYRIAN-BABYLONIAN PERIOD, B. C. 1200-529

CHARACTERISTICS OF THE CENTURIES	THE HEBREWS	ASIA AND AFRICA	EUROPE	ARTS AND SCIENCES	LITERATURE
<b>B. C. 1200—1000</b>					
Heroic age of Greece; Hebrews reach their highest point of national power. Beginning of the Medo-Persian nations. Celts disperse over western Europe and into British Isles.	1161. Israel enslaved by the Philistines. Samson born. 1136. Samson slays 1,000 Philistines.  1116. Samuel, last Judge of Israel.  1065. Saul becomes King of Israel. 1055. David born.  1055. Death of Saul; accession of David. 1048. David, King of all Israel.  1042. The Ark removed to Jerusalem. 1039. Revolt of Abalom. 1033. Solomon born. 1016. Death of David. 1015. Solomon ascended King. 1012. Solomon begins the Temple. 1004. Dedication of Temple.	1194. Trojan war. 1184. Troy taken.  1140. Tiglath-Pileser real founder of the Assyrian empire. 1133. Chou dynasty begins in China.    1044. Ionian emigrants settle in Asia Minor.  1000. Solomon and Hiram, King of Tyre, form an alliance; also Solomon and Pharaoh. 986. Utiaca built. Samsu built.	1132. Alba Longa built by Ascanius.  1124. Æolian migration. Thebes capital of Boeotia founded. 1104. Return of the Heracleidae. End of the Kingdom of Mycenae.  1070. Heremom, of Galicia, conquers Ireland. 1060. Athens governed by Archons.	1115. Mariner's compass known in China.       1015. Minos gives Crete his code of laws. 1000. Solomon extends his commerce to India; builds Palmyra, Haulbe, and other cities.	Dictionary of Chinese completed by Fe-o-tse.
<b>B. C. 1000—800</b>					
Homeric age. Celts already in Britain, with bronze in use. Phœnician trade extended from Senegal to India. Temporary decline of Assyria.	<b>JUDAH</b>  971. Shishak, King of Egypt, takes Jerusalem.    888. Philistines plunder Jerusalem.  884. Uprising and death of Athaliah.	<b>ISRAEL</b>  975. Jeroboam establishes idolatry.  918. Ahab and Jezebel. 901. The Syrians besiege Samaria. 898. Elijah translated to heaven.  884. Jehu, King.  840. Jehoshaphat defeats King Benhadad of Syria.   770. Pul invades Israel, and is bribed to depart.    721. Samsar taken by the Assyrians; Ten Tribes carried into captivity.	976. Cypria reigns in Alba Longa.  938. Bacehus, King of Corinth.  898. Tiberinus, King of Alba, drowned in the river Albula, which is thereafter called the Tiber.  864. Romulus, King of Alba Longa.  814. The Kingdom of Macedonia founded by Caranus.  769. Syracuse founded by Archias of Corinth. 753. Building of Rome. 750. Sabine war. 747. Union of Romans and Sabines. 743. First Messinian war.	975. Death of Solomon. Revolt of the Ten Tribes. Two kingdoms formed.  918. The Rhodians begin navigation laws.  884. Lycurgus reforms the constitution of Sparta. 869. Gold and silver coined by Phidon, ruler of Argos.	Homer, Greek poet.       Homer's poems brought into Greece.
<b>B. C. 800—700</b>					
Ethiopian supremacy in Egypt. Assyrian conquests continue; Tiglath-Pileser III.; Sargon; Babylonia rises to height of its power.	741. Pekah, King of Israel, besieges Jerusalem; 120,000 of his men slain.  726. Hezekiah abolishes idolatry.          <b>HEBREWS</b>  717. Hezekiah, King. 712. Sennacherib invades Judah. 711. His army (185,000) destroyed by pestilence.  696. Manasseh, King.	<b>BABYLONIA</b> 737. Sennacherib invades Egypt. 736. Tiglath-Pileser III. conquers Syria and part of Israel. 721. Sennacherib, King of Babylonia, takes Samaria and carries the remainder of the Ten Tribes into captivity.  710. Media becomes a kingdom.	718. Romulus reputed murdered.	710. Roman calendar reformed; year divided into 12 months instead of 10, as before.	Greek lyric poetry flourishes.

## THE ASSYRIAN-BABYLONIAN PERIOD, B. C. 1200-529—Continued

CHARACTERISTICS OF THE CENTURIES	HEBREWS	BABYLONIA	EGYPT	EUROPE	ASTR. SCIENCES, ETC.	LITERATURE
<b>B. C. 700-600</b>  Zenith and fall of Nineveh, and Assyrian empire. Media rises to power. Perhaps last migrations from the Aryan center—Teutonic and Slav races.	677. Manasseh, carried to Babylon, is afterward restored.	680. Babylon and Nineveh are united under Esarhaddon.		685. Second Median War. 678. Argæus, first King of Macedonia. 672. Tullius Hostilius, King of Rome. 664. First sea-fight on record—between the Corinthians and Ceryneans. 658. Hyphantium founded.	680. Chess invented.	Iambic verse introduced.
		48. Sarracus, King of Babylon and Nineveh.	660. Psammethichus, King of Egypt. Memphis becomes the capital.	640. Latins conquered by the Romans. Philip I., King of Macedonia.	640. Spherical form of the earth and true cause of lunar eclipses taught by Thales. 631. Draconian code formulated.	Attempt to discover the primitive language of mankind.
	606. Conquest of Jerusalem by Nebuchadnezzar.	612. Nineveh a second time destroyed. 606. Nebuchadnezzar defeats Necho of Egypt, takes Judea and takes Jerusalem. 604. Nebuchadnezzar, King of Babylon. 599. Birth of Cyrus.	610. Pharaoh-Necho, King of Egypt. 600. Psammis, King of Egypt. 594. Pharaoh-Hophra (Apries), King of Egypt. 581. Egypt invaded by Nebuchadnezzar.	616. Tarquinius Priscus, King of Rome. 602. Illyria conquered by Macedonia. 594. Solon, Archon of Athens.	610. Pharaoh-Necho begins a canal between the Mediterranean and Red Sea. Many lives lost in the attempt. He also sent out a Phœnician fleet which circumnavigated Africa. 594. Solon's code supersedes that of Draco at Athens.	Alcæus and Sappho, Greek poets.
<b>B. C. 600-500</b>  Zenith and fall of Babylon. Long reign of Nebuchadnezzar; he ravages Egypt. The seventy years' captivity of Judah. Rise of Persia.	591. Ezekiel prophesies to Chaldees. 589. Captivity of Judah completed; Jerusalem destroyed, Temple burnt. 579. Jews carried to Babylon.	589. Invades Phœnicia. 572. Takes Tyre.	569. Amasis, King of Egypt, makes alliance with Greece.	578. Servius Tullius, King of Rome. 567. Conquest of Etruria by Rome. 565. First census of Rome: 64,700 citizens. 550. The Phœnicians emigrate to Gaul and build Massilia (now Marseilles).	578. Money coined at Rome by Servius Tullius.	Poems of Anacreon.
	<b>PERSIA</b> 560. Cyrus, King of Persia. 549. Cyrus conquers Babylon. 538. Takes Babylon.  536. Persian empire composed of Assyria, Media, and Persia. Captivity of the Jews ended. 529. Temple rebuilt at Jerusalem. 529. Death of Cyrus; Cambyses, King of Persia.	562. Croesus, King of Lydia, subjects Asia Minor.  538. Babylon taken by Cyrus the Persian.	536. Pythagoras visits Egypt. 535. Made tributary by Cyrus.	528. Thrace comes into view.

## PARALLEL OUTLINES OF AMERICAN HISTORY

## I. PREHISTORIC PERIOD, B. C. 955-1492 A. D.

955. Civilization of aborigines of Mexico and Central America begun by the advent of Yotan.
800. Zama introduced the Maya civilization, and founds Mayapan, capital of what is now Yucatan.
476. Piria dynasty probably begins in Peru. The Toltecs arrive in Mexico and Central America about the Christian era, and displace the previous government.
- A. D.
503. Mexican history begins according to Itzlihoehitl.
600. Toltecs established the first empire.
830. Piria dynasty declines in Peru.
961. Iceland discovered by Nadod, a Norse rover.
875. First settlement by Norsemen.
876. Grumbrion sights a western land.
982. Land discovered by Eric the Red, and named Greenland.
983. Second voyage from Iceland to Greenland by Eric.
985. Bjarni sails from Iceland for Greenland, but is driven south by a storm and sights land at Cape Cod or Nantucket, also at Newfoundland, and returns to Greenland.
1000. Voyage of Leif, son of Eric the Red. He sails in one ship with 35 men in search of the land seen by Bjarni.
1001. Touching the Labrador coast, he stops near Boston, Mass., or farther south, for the winter. He loads his vessel with timber, and returns to Green-

- land in the spring. He calls the land Vinland, from its grapes.
1002. Thorwald, Leif's brother, visits Vinland in 1002, and winters near Mt. Hope bay, Rhode Island. In the spring of 1003 he sent a party of his men to explore the coast, perhaps as far south as Cape May.
1004. Thorwald explores the coast eastward, and is killed in a skirmish with the natives somewhere near Boston.
1005. His companions return to Greenland.
- 1007-8. Thorfinn Karlsefne sails with three ships and 160 persons (five of them young married women) from Greenland to establish a colony. Landing in Rhode Island, he remains in Vinland three years.
1050. End of the Toltec power in Mexico.
- 1121-47. Icelandic manuscripts mention a bishop in Vinland in 1121, and other voyages there in 1122, 1135 and 1147.
1240. Inca's rule begins in Peru.
1350. Rise of Aztec power, and founding of City of Mexico.
1347. Latest tidings of Vinland.
1349. Sciregur appear in Greenland.
1350. Communication with Greenland ceases.
1402. Seigneur Jean de Béthencourt settles the Canary Islands.

Hieroglyphic documents containing traditions of the pre-Toltec or Yotan period, said to have been publicly destroyed by Francisco Nuñez de la Vega, bishop of Chupaa, in 1691.

## II. PERIOD OF AUTHENTIC DISCOVERY AND EXPLORATION, 1492-1607 A. D.

MONARCHS OF SPAIN	EXPLORATION	MONARCHS OF ENGLAND	EXPLORATION	MONARCHS OF FRANCE
1474-1516. Ferdinand and Isabella.	1492. Columbus sailed, on his first expedition, from Palos, in Andalusia, on Friday, with three vessels, supplied by the sovereigns of Spain—the Santa Maria, a decked vessel, with a crew of fifty men, with Columbus in command; and two caravels—the Pinta, with thirty men, under Martin Alonso Pinzon; and the Nina, with twenty-four men, under Vicente Yañes Pinzon, brother of Martin. He discovered a small island of the Bahama group, October 12; Cuba, October 26; and Hispaniola (now Hayti), where he builds a fort, La Navidad, December 6.	1483-1509. Henry VII.	and called the country New France. He anchored between the mouth of Cape Fear river and Pamlico sound, at New York, Newport, and on the New England coast.	1483-1498. Charles VIII.
	1493. Columbus sails for Spain in the Nina, the Santa Maria having been abandoned; sails from Cadiz on his second expedition.	1524. Stephen Gomez, a Portuguese navigator sent out by the Spanish government, explored the coast from Maine to Florida.	1525. Expedition of de Ayllon under Pedro de Quezco explored the coast 250 leagues north of St. John, taking land in name of Charles V.	
	1494. Discovers Jamaica, May 3; and Evangelista (now Isle of Pines), June 13, war with the natives of Hispaniola.	1526. Vaquez de Ayllon sailed to the Chesapeake, where he made a settlement, San Miguel de Guanapoco.	1527. Captain John Rut of England coasted as far as South Carolina.	
	1495-6. Vista various islands, and explores their coasts.	1527. Pedro de Narvaez received a patent from Charles V. styling him governor of Florida, Rio de Palmas, and Espiritu Santo (the Mississippi).	1527. Antonio Nufes Cabeza de Vaca found the River Citia in New Mexico having been lost by the Narvaez expedition.	1498-1515. Louis XII.
	1496. Returns to Spain to meet charge; reaches Cadiz.	1528. Panfilo de Narvaez in April arrived at Tampa bay, Florida, having the year before been appointed governor by Charles V.	1528. Alvaro Nufes Cabeza de Vaca crossed the mouth of the Mississippi.	
	1497. John Cabot discovers the North American continent.	1529. Hernando de Soto, with his expedition, landed at the Bay Espiritu Santo, taking formal possession of the land in the name of the King of Spain.	1530. Fra Marcos de Niza (de Nier), a monk, took possession of the land of the Seven Cities in the name of the vicerey and governor of New Spain, on behalf of the emperor, giving the name of the New Kingdom of St. Francis.	
	1498. Columbus sails with six ships on his third voyage, May 30; discovers Trinidad; July 31; lands on terra firma without knowing it to be a new continent, naming it Isla Santa; discovers the mouth of the Orinoco.	1540. Hernando Alarcon ascended the Colorado from the Gulf of California.	1542. Jean Alfonse, a native of Cognac, France, entered Massachusetts bay.	
	1499. Alonso de Ojeda discovers Surinam, June; and the Gulf of Venezuela. Amerigo Vesputi accompanies him on this voyage.	1543. Juan Rodriguez Cabellero, a Portuguese in the Spanish service, explored the Pacific coast as far as Cape Mendocino.	1543. Juan Rodriguez Cabellero, a Portuguese in the Spanish service, explored the Pacific coast as far as Cape Mendocino.	
	1500. Vicente Yañes Pinzon discovers Brazil, January 20; and the river Amazon. Gaspar Cortesal, in the service of Portugal, discovers Labrador.	1549. Father Luis Cancer de Barbastro, a Dominican, under Spanish direction, reached the coast of Florida.	1558. Guido de Lahaaraz visited Pensacola bay in the interest of Spanish settlements.	
	Francisco de Bobadilla appointed governor of Hispaniola, and leaves Spain; Bobadilla arrests Columbus on his arrival at Hispaniola, and sends him to Spain in irons. He is received with honor at court, and the charges dismissed without inquiry.	1559-1547. Henry VIII.	1561. Angel de Villafra reached Santa Elena, now Fort Royal sound, South Carolina. Subsequently doubled Cape Hatteras.	
	1501-3. Amerigo Vesputi on the South American coast.	1547-1553. Edward VI.	1562. Jean Ribault, commanding a number of French Protestants (Calvinists), took possession of Fort Royal—Santa Elena—and founded Charlefort. This was the earliest attempt at settlement as distinct from exploration.	1515-1547. Francis I.
	1502. Columbus sails, on his fourth and last voyage, with four caravels and 150 men, from Cadiz; discovers the island of Martinique; discovers various islands on the coast of Honduras, and explores the coast of the isthmus.	1553-1558. Mary.	1563. René Goulaine Laudonnière made a Huguenot settlement at the mouth of the St. John's river, near Fort Caroline.	1547-1559. Henri II.
	1504. Columbus finally leaves the new world for Spain.		1565. Pedro Menendez de Aviles made the coast of Florida near Cape Canaveral, to drive out the French.	1559-1560. Francis II.
	1509. Francisco Pizarro reaches Darien.		1566. John Hawkins, of England, passed along the whole coast of Florida, being the first Englishman to give any account of the country.	1560-1574. Charles IX.
	1510. Alonso de Ojeda founds San Sebastian, the first colony in south America.		1565. Menendez discovered and named the harbor of St. Augustine, where he remained, ultimately taking possession of the land in the name of Philip II, King of Spain.	
1516-1556. Charles I.	1511. Diego Hernandez de Córdoba landed on the Havana.		1566. Captain Juan Pardo penetrated to the region of the Cherokee—Florida.	
	1512. Juan Ponce de León, in the interest of Spain, discovered the mainland; he landed and took possession in the name of the King of Spain (Florida).			
	1517. Francisco Hernandez de Córdoba landed on the Florida coast.			
	1519. Francis de Garay discovered the Mississippi, naming it Rio del Espíritu Santo.			
	1520. Lucas Vázquez de Grijalva (Spanish) entered St. Helena sound, South Carolina, and anchored at the mouth of the Combahee river. The country was named Chicora; the river, Jordan.			
	1521. Francisco Hernandez de Córdoba the expedition of Lucas Vázquez de Grijalva, arrived on the Florida coast.			
	1522. Overthrow of Aztec power by Spaniards under Cortes.			
	1524. Giovanni da Verrazano (John Verrazano), in the service of Francis I., King of France, coasted between the 28th and 50th degrees of north latitude.			

## II. PERIOD OF AUTHENTIC DISCOVERY AND EXPLORATION—Continued

MONARCHS OF SPAIN	EXPLORATION	MONARCHS OF ENGLAND	EXPLORATION	MONARCHS OF FRANCE
1550-1598. Philip II.	1567. Dominique de Gourgues, with a French expedition of three ships, arrived in April to avenge the death of Ribault. He assaulted and took the Spanish forts, numbers.	1558-1603. Elizabeth.	Dartmouth, England, sighted the coast of Maine near Casco Bay, calling the place Northland, exploring Cape Cod, Martha's Vineyard, south to Cuttyhunk.	1574-1598. Henry III.
	1570. Menendez established a mission under Father Segura on the Chesapeake bay waters, probably the Rappahannock.		1602. Sebastian Vizcaino, coast of California.	
	1579. Francis Drake took possession of New Albion (California) in the name of Queen Elizabeth.		1603. Martin Pring, of England, sighted the islands of Maine and Massachusetts bay, entering the present harbor of Portland.	
	1584. Raleigh's expedition under the charter of Queen Elizabeth, in command of Philip Amadas and Arthur Barlowe, reached the coast of Virginia, taking possession in the name of the queen.		1604. Samuel de Champlain, in the interest of the French, ascended the Penobscot river, Maine.	
	1585. Raleigh's second expedition, under Sir Richard Grenville, arrived at Ocracoke inlet. He left a colony of 107 men at Roanoke Island, Virginia.		1604. George W. Weymouth, sailing from Dartmouth, explored the Kennebec.	
	1586. Sir Francis Drake, after sailing St. Augustine, came to anchor near Roanoke Island, taking back to England the earliest colony of emigrants.		1606. Sir Ferdinando Gorges dispatched an expedition under Thomas Thomas.	
	1587. Raleigh's third expedition, under Simon Ferdinando, arrived at Hatteras (Hatteras), landing 120 pounds.		1607. An English expedition for colonization left the Downs, and reached Chesapeake bay. It consisted of the <i>Sovereign</i> , Captain Christopher Newport, with seventy-one persons; <i>God-Speed</i> , Captain Bartholomew Gosnold, with fifty-two persons; <i>Discovery</i> , Captain John Rolfe, with twenty persons; crews, thirty-nine total 104 persons. May 13, landed, and settled Jamestown, Virginia. The political history of the United States begins with this event.	
	1602. Captain Bartholomew Gosnold, sailing from			

### III. COLONIAL PERIOD, 1607-1763 A. D.

BRITISH COLONIES	MONARCHS OF ENGLAND	FRENCH COLONIES	MONARCHS OF FRANCE	SPANISH COLONIES	MONARCHS OF SPAIN
1607. English settlement at Jamestown. Captain John Smith resumed by Pocahontas.	1603-1625. James I.	1606. Champlain settles Quebec.	1589-1610. Henri IV.	1610. Leon, Central America founded.	1598-1621. Philip III.
1614. New Amsterdam settled by the Dutch.		1611. French Jesuits settle at Port Royal.	1610-1643. Louis XIII.	1611. Talamancas Indians, of Central America, massacred by the Spanish.	
1618. Death of Powhatan, Indian chief.		1615. Indian missions established.		1620. Buenos Ayres separated from Tucumán.	
1619. First slaves brought to Virginia by the Dutch.		1620. Champlain governor of Canada.			1621-1664. Philip IV.
1620. Mayflower lands at Plymouth, Mass. Peregrine White, first white child born in New England.					
1621. Death of John Carver, first governor of Plymouth colony; succeeded by William Bradford.					
Mike Standish, captain.					
1622. New Hampshire settled.					
1623. Lord Baltimore founds a colony at Ferryland, Newfoundland.	1625-1649. Charles I.	1628. Port Royal taken by the English.		1630. Spaniards expel the Dutch from Brazil.	
1627. Swedes and Finns settle at Cape Henlopen.		1629. Sir David Kirke captures Quebec.		Alvarado subdues Central American Indians.	
1628. John Endicott governor of Massachusetts.		1632. Richelieu obtains restoration of territory.		Havti seized by French buccaners.	
1629. John Winthrop governor of Massachusetts.				1635-1638. French, English and Dutch make numerous settlements in the West Indies.	
1632. Lord Baltimore receives the grant of Maryland.					
1633. Connecticut settled by the English.					
Wentur Van Twiller governor of New Amsterdam.					
1634. English Catholics settle at St. Mary's, Maryland.					
1636. Roger Williams settles Rhode Island.					
Pequot war begins in Massachusetts.					
Sweden settles Delaware.					
1638. John Harvard bequeaths his library to found a college.					
New Haven settled.					
1639. Printing press established by Stephen Daye at Cambridge, Massachusetts.		1639. Ursuline convent established at Quebec.			
First constitution of Connecticut.		1640. The French attempt a settlement at Green Bay, Wisconsin.		1640. Spanish fleet of sixty vessels arrives off coast of Brazil.	
		1641. Montreal founded.			
1642. Sir William Berkeley governor of Virginia.			1643-1715. Louis XIV.		
1643. Sweden settles in Pennsylvania.					
1645. Free schools established at Roxbury, Mass.					
1647. Peter Stuyvesant governor of New Amsterdam.					
1652. Mint established in Boston, John Hull, mintmaster.	1649-1660. Commonwealth.				
1653. North Carolina settled.					
1655. Delaware brought under Dutch rule.					
1656. Quakers arrive in Boston.					
	1660-1685. Charles II.	1659. Laval-Montmorency first bishop of Quebec.		1661. Dutch give up Brazil.	
		French fur traders capture Lake Superior.		1663. Spain denies the right of England to the province of Carolina.	
				1665. St. Augustine pillaged by English buccaners.	1665-1700. Charles II.
1664. Fort Amsterdam surrendered to the English.		1668. Marquette establishes mission at Sault Ste. Marie.			
1665. Provincial government established in Maine.		1670. Maine, east of the Penobscot, occupied by the French.		1671. Danes occupy St. Thomas.	
1670. South Carolina settled.		1672. Count de Frontenac governor of Canada.			
1671. French settle in Michigan.		1673. Marquette and Joliet descend the Wisconsin to the Mississippi in canoe, continue on nearly to mouth of the Arkansas, and return.			
		Fort Frontenac (Kingston, Ontario) built.			
1673. New York and New Jersey surrendered to the Dutch.					
1675. King Philip's war in Massachusetts.					
1676. Nathaniel Bacon's rebellion in Virginia.					

## III. COLONIAL PERIOD—Continued

KING PHILIP'S WAR, 1675-1676					
WHERE IT OCCURRED	CAUSES	INDIAN TRIBES INVOLVED	EVENTS	RESULTS	
Massachusetts, Rhode Island and the frontier settlements of all New England.	The prosperity and the encroachments of the whites. The unjust treatment of the Indians.	The Wampanoags, Narragansetts, Pequots, and other tribes living in New England.	Swansey, Hadley, Deerfield and other towns were burned. The Pequots were almost exterminated in the swamp fight.	The colonies sacrificed six hundred lives and more than half a million odd dollars. The settlements were greatly weakened.	
BACON'S REBELLION, 1676					
CAUSES		EVENTS		RESULTS	
(1) The government gradually usurped the power of the people. The assembly continued to sit without change. The officers extended their terms indefinitely. Suffrage was restricted by a property qualification, and the people were heavily taxed. (2) There was dissatisfaction because the king had given Virginia to Lords Arlington and Culpeper. (3) Indian depredations.		Nathaniel Bacon, the leader, demanded a commission to fight the Indians. Berkeley refused to grant it, and Bacon, without the governor's consent, put himself at the head of a company of men, and marched against the Indians. Returning victorious, Bacon was triumphantly restored to his seat in the House of Burgesses. Here he pressed his demand for a commission until the governor yielded, and Bacon a second time went against the Indians. Bacon after he had gone, Berkeley declared Bacon and his followers rebels, and marched against them. Berkeley was defeated, and Bacon entered Jamestown. Fearing the arrival of an English fleet, he burned the town. In the midst of success Bacon died, and Berkeley regained the power.		There were fines, imprisonments, and confiscations of property; twenty-two of the rebels were hung. Charles II, disgusted with the severity of Berkeley, recalled him. The oppressions of the people were increased. Williamsburg became the capital of Virginia. After this time there was very little trouble with the Indians in Virginia.	
BRITISH COLONIES		MONARCHS OF ENGLAND	FRENCH COLONIES	MONARCHS OF FRANCE	SPANISH COLONIES
1681. William Penn receives charter for Pennsylvania. 1683. First assembly in New York under English rule.  1689-1697. <b>King William's war.</b> 1690. Colonial Congress called in New York.  1700. Williamsburg made capital of Virginia. 1701. Philadelphia incorporated as a city. 1702-1713. <b>Queen Anne's war.</b> 1704. Deerfield, Massachusetts, burned.  1719. Scotch-Irish settle in New Hampshire.   1729. British government formally recognises colony of Newfoundland. 1732. First stage between Boston and New York. 1739. Richmond, Va. founded by William Byrd.  1744-1748. <b>King George's war.</b> Hostilities with the six Indian nations. 1746. Louisburg, Cape Breton Island, N. S., captured by New England troops.  1752. Franklin experiments with electricity. 1753. First theater opened in New York. 1754. Convention at New York to consider a colonial confederacy. <b>French and Indian war.</b>		1689-1689. James II. 1689-1702. William III. Mary.  1702-1714. Anne. 1714-1727. George I.  1727-1760. George II.  1760-1820. George III.	1679. French at Niagara falls. 1682. Le Salle descends the Mississippi to its mouth and names the regions drained by the Mississippi, the Ohio, and their tributaries, "Louisiana." 1685-1687. French in Texas under La Salle. 1689. French occupy Hudson bay territory. Iroquois capture Montreal and Lachine. 1691. Acadia retaken by the French. 1702. Settlement in Alabama on Mobile river. 1710. Fort Royal captured by English fleet. 1718. New Orleans founded.  1729. Massacre of French at Natchez by Indians.  1745. Louisburg, N. S., captured by the British. 1749. Fort Rouille (Toronto) built. 1752. Marquis Duquesne, governor of Canada.  1760-1820. George III.	1715-1774. Louis XV.  1774-1793. Louis XVI.	1685. Dampier, English buccaneer, sacks Leon.  1693. Gold mining begins in Brazil.  1710. French capture Rio de Janeiro.  1719. French capture Pensacola. 1722. Pensacola restored to Spain. Treaty between Chilians and Spaniards. 1729. Spaniards establish themselves at Montevideo.  1740. General Oglethorpe attacks Florida.  1746-1759. Ferdinand VI.  1759-1788. Charles III.
FRENCH AND INDIAN WAR, 1755-1763					
CAUSES	CAMPAIGNS AND ENGAGEMENTS			RESULTS	
<i>Remote.</i> a. The conflicting claims to territory. b. The enmity between England and France. <i>Immediate.</i> c. The settlement of the Ohio valley.	1753. Washington was sent to the French fort. A fort was begun by the Ohio company at the headwaters of the Ohio river. 1754. A force was sent from Virginia to the Ohio valley. The first bloodshed was at Great Meadows. The attack on Fort Necessity. The Council at Albany. 1755. An expedition against the Acadians. An expedition against Fort Duquesne. An expedition against Fort Niagara and Frontenac. An expedition against Fort Ticonderoga. 1756. The Indians were defeated in Pennsylvania and Virginia. Fort Ontario was captured by the French. 1757. A campaign against Louisburg. Fort William Henry was captured by the French. 1758. The siege of Louisburg, Cape Breton Island. An expedition against the forts on Lake Champlain. An expedition against Fort Duquesne. Fort Frontenac was captured by the English. 1759. An expedition against Fort Ticonderoga. An expedition against Fort Niagara. The siege of Quebec. The French were defeated near Quebec. Wolfe and Montcalm killed. Montreal was surrendered to the English. The Cherokee war. 1761. Havana was captured by an English fleet. 1763. Pontiac's war.			The treaty of Paris. a. France surrendered Canada to England, except three small islands near Newfoundland, and her possessions east of the Mississippi river, except New Orleans. b. France ceded to Spain her possessions west of the Mississippi river, and New Orleans. c. Spain ceded Florida to England in return for Havana. It cost the colonists thirty thousand men and eleven million dollars. It engendered strife between the colonists and England. It created a bond of union among the colonies. It skilled the colonists in the art of war. It gave England a vast extent of territory in the new world, which, added to what she already possessed, proved too great for her control. During the war, England allowed the colonies freedom in trade. When she again attempted to enforce her obnoxious laws, the colonists resisted more persistently than before.	

## IV. PERIOD OF UNION AND INDEPENDENCE, 1763-1783 A. D.

BRITISH COLONIES	CONTINENTAL CONGRESS				SPANISH COLONIES
	CONGRESS	HELD AT	BEGAN	CONTINUED	
1765. The Stamp act passed by the English Parliament. A convention of the colonies assembled in New York, October 7, to resist the Stamp act. In November tumults occurred in Boston.	1	New York.	May, 1690		
1766. The Stamp act repealed by the House of Commons.	2	Albany.	June 19, 1754		
1767. The taxation of the colonies resumed, against addresses, petitions, and remonstrances of the people.	3	New York.	Oct. 3, 1765		
1773. Settlement of the territory afterward comprised within Kentucky, by Daniel Boone.	Stamp Act Congress				
1774. By act of Parliament, the port of Boston closed, and General Gage appointed governor of Massachusetts to see that the law was executed. September 5, twelve colonies formed themselves into a Congress.	1	Philadelphia.	Sept. 5, 1774	14 days	1766. Large colony of Acadians arrive in Louisiana.
1775. Coercive measures continued on the part of Great Britain, and the colonies awake to the determination for the Declaration of Independence, July 4, 1776.	2	Philadelphia.	May 10, 1775	562 days	1768. Revolt of the French against Spanish rule in Louisiana.
1776, June 11. Committee appointed "to prepare and properly digest a form of confederation to be entered into by the several states." Committee: John Dickinson, Chairman; Jonah Bartlett, Samuel Adams, Roger Sherman, Robert R. Livingston, Thos. McKean, Thos. Boone, Thos. Nelson Jr., Edward Rutledge, Boston Gwinnett (one delegate from each state).	3	Baltimore.	Dec. 20, 1776	75 days	1773. Santiago, Guatemala, destroyed by an earthquake.
	4	Philadelphia.	Mar. 4, 1777	199 days	
	5	Lancaster, Pa.	Sept. 27, 1777	1 day	
	6	York, Pa.	Sept. 30, 1777	272 days	
	7	Philadelphia.	July 2, 1778	1616 days	
	8	Princeton, N. J.	June 30, 1783	127 days	
	9	Annapolis, Md.	Nov. 28, 1783	169 days	
	10	Trenton, N. J.	Nov. 1, 1784	64 days	
	11	New York.	Jan. 11, 1785	298 days	
	12	New York.	Nov. 7, 1785	362 days	
	13	New York.	Nov. 6, 1786	359 days	
	14	New York.	Nov. 5, 1787	353 days	1774. Old Guatemala destroyed by volcanic eruption.

THE AMERICAN REVOLUTION, 1775-1783		
CAUSES	PRELIMINARY EVENTS	RESULTS
<i>Remote:</i> The character of the colonists. The arbitrary government of England. a. Laws passed by parliament interfering with colonial trade and industries. b. The character of the royal governors. The presence of anti-monarchical institutions. a. Great strike of anthracite coal miners in Pennsylvania. National conservation commission convened at Washington.	1908. Industry and education strongly accentuated throughout the Dominion.	1908. Preliminary plan for Central American federation formed. Vast municipal improvements in Rio de Janeiro.
1909. William H. Taft, President; James S. Sherman, Vice-President. U. S. fleet returns from world voyage. Payne-Aldrich tariff law enacted. Hudson-Fulton celebration in New York. President Taft and Diaz met at El Paso, Texas, and exchanged friendly greetings.	Philander C. Knox, Sec. State, James Wilson, Sec. Agric., J. M. Dickinson, Henry L. Stimson, Sec. War, R. A. Ballinger, Walter L. Fisher, Sec. Int., George von L. Meyer, Sec. Navy, James Wilson, Sec. Agric., F. H. Hitchcock, Post. Gen., G. W. Wickham, Atty. Gen., Charles Nagel, Sec. Com. and Labor.	1909. Alaska-Yukon-Pacific exposition held at Seattle. Tunnel under Hudson river completed. 1910. Postal savings bank law approved. Tariff board and commission established. Telegraph and telephone companies put under the jurisdiction of the interstate commerce commission.	1909. Arbitration treaty signed in Washington between Canada and United States.	1909. Ex-President Gálvez expelled from France.

## HISTORY OF NATIONS AND IMPORTANT DEPENDENCIES

**Abyssinia** is a part of what was anciently called Ethiopia; *tyopopia* is still the Abyssinian name of the country. The first mention of it is in the native tradition, was Menelik or Menelik, the son of Solomon and the Queen of Sheba. Christianity was introduced in the fourth century by Frumentius; the kingdom of Axum, named from the capital, was the nucleus of the state, and attained its greatest extent in the sixth century. From the commencement of the church of Abyssinia, which was the mother-church of Egypt, and with her adopted the Monophysite doctrine; and the metropolitan bishop or abuna continues to be nominated by the emperor.

The modern history of Abyssinia has been mainly struggles between the princes of various districts for supreme power. About 1850 an Amharic adventurer obtained dominion over successive provinces, and in 1855 had himself crowned, under the name of Theodore, as Negus of Abyssinia. His maltreatment of European political agents and missionaries led to the British expedition under Lord Napier, which stormed Magdala. Theodore's royal fortress, whereupon Theodore died by his own hand. Johannes, King of Tigré, was the next ruler, and on his death in 1889, Menelik of Shoa succeeded to the empire. Meanwhile Italy had occupied the flats on the coast, now the Italian dependency of Eritrea (with Massawa as headquarters).

By a convention of 1889 Abyssinia became almost an Italian protectorate; but after the battle of Adowa (1896), disastrous to the Italians, Italy fully recognized Abyssinian independence. In 1906 an agreement was signed by Great Britain, France, and Italy to preserve the integrity of Abyssinia.

**References.**—*Ben's Sacred City of the Ethiopians*; *Gleichen's With the Mission to Menelik*; *Vivian's Abyssinia*; *Wright's Modern Abyssinia*; *Sinclair's Abyssinia of To-Day*.

**Afghanistan.**—The history of Afghanistan as an independent state dates only from the middle of the eighteenth century. For centuries before, Herat and Kandahar had been in the possession of Persia; while Kabul was included in the Mogul empire of Delhi. Upon the death of Nadir, in 1747, the Afghans and Shah Durani subjugated the different provinces, and when he died in 1773, left an empire to his son, Timur Shah.

The chief events in the history of Afghanistan are the expedition in 1839 which established Shah Shojah on the throne; the rebellion of 1841, in which the residents Burnes and Macnaghten were killed, and the Anglo-Indian troops perished in the retreat; the punitive expedition in 1842; the defeat of Dost Mohammed in 1849; the war with Shere Ali in 1878-79; and installment of Yakub Khan; the rising at Kabul and murder of Cavanagh the English resident; the punitive expedition under Lord Roberts; the establishment in 1881 of British suzerainty; Abdurrahman, succeeded in 1901 by his son Habibullah; and alarm as to Russian encroachments. The independence of the country, however, was guaranteed by the Anglo-Russian agreement.

**Argentine Republic, or Argentina.**—In 1516 the estuary of La Plata was discovered by Juan Diaz de Solis, who, with his companions, were killed and devoured by the natives. In 1526, Sebastian Cabot visited the Plata, and one of his captains, ascending the Paraná, built a fort at the mouth of the Caracaras. The Emperor Charles V. subsequently sent out an expedition in 1580, commanded by Mendoza, who founded the city of Buenos Ayres, in 1535. The Spaniards, after the lapse of half a century, resumed in establishing their prime colony, built cities, and founded Jesuit missions.

In 1726 the Portuguese, jealous of the ascendancy of Spain, founded the city of Montevideo in the Banda Oriental. In 1776

the Plata provinces were separated from the government of Lima, and formed into the viceroyalty of Buenos Ayres. In 1806, a British expedition was dispatched to the Rio de la Plata, and captured Buenos Ayres, which was ultimately retained by the Spaniards. A second attack met with no better result. In 1808 the Spaniards revolted, deposed the viceroy, and declared a provisional government. After a protracted struggle with the colonies, they accomplished their independence.

Between 1810 and 1835 the Argentine province had no fewer than thirty-six changes of government. In the last-mentioned year, Rosas was elected president, with dictatorial powers. He ruled the country with an iron tyranny for seventeen years, sought to bring the Banda Oriental, or Uruguay (as it is now termed), under his control, and also to exclude foreign commerce from the river Plata. Upon this, France and England blockaded Buenos Ayres, occupied Montevideo, and captured the Argentine fleet. In 1849 a peace was concluded.

In 1851 Brazil and Paraguay, objecting to the control of Rosas over the navigation of the Rio de la Plata, declared against the Argentine Republic. Their confederated forces, amounting to 18,000 men, utterly defeated Rosas in the battle of Caceres, or Pacheco, in 1852. The Argentine Republic was then declared open to the world; and in 1853, the present constitution was established. After the fall of Rosas, the government was successively assumed by Gen. Urquiza and 1862; and, in 1860, by Gen. Mitre. In 1862 Buenos Ayres was declared the capital of the Argentine Republic, which continued to be until 1908, when Rosario was made the seat of the federal government.

When the ambitious designs of Lopes, the dictator of Paraguay, led to a war with Brazil, the Argentine Republic took a neutral attitude, but upon the refusal of Mitre to allow the Paraguayan troops passage through his territory, Lopes crossed the Paraná, and invaded the Argentine Republic, with his vessels, as well as the persons of Argentine subjects, upon whom he levied blackmail. These outrages obliged the Argentine Republic to ally itself with Brazil against the common enemy. A long and sanguinary war followed, with varying success, until the fall of Angotera, the last stronghold of Lopes, which was taken by the allies on Dec. 22d, 1868, after a desperate resistance.

After a wise and popular rule, Gen. Mitre was succeeded as president, in 1880, by Senhor Domingo Sarmiento. In 1874 an insurrection broke out in Buenos Ayres, which was suppressed in 1875, and the president resigned in 1880, and was succeeded by Dr. Colman, in 1886. In 1890 financial troubles and political turmoil seriously injured the well-being of what was long the best governed and most prosperous of South American States. Dr. Saenz Pena has been president since 1910.

**Australia.**—It is doubtful when Australia was first discovered by Europeans. Between 1521 and 1542 the Portuguese published the existence of a land which they called Great Java, and which corresponded to Australia, and probably the first discovery of the country was made by them early in the sixteenth century.

The first authenticated discovery is said to have been made in 1601, by a Dutchman named Manoel Godinho de Eredia. In 1606 Torres, a Spaniard, passed through the strait that now bears his name, between New Guinea and Australia. Between the years 1628 and 1628 a large portion of the coast-line of Australia had been surveyed by various Dutch navigators. In 1664 the continent was named New Holland by the Dutch govern-

ment. In 1688 Dampier coasted along part of Australia, and about 1760 explored a part of the western and northwestern coasts. In 1770 Cook carefully surveyed the east coast, named a number of localities, and took possession of the whole of the continent. This was followed by Bligh in 1789, who carried on a series of observations on the north-east coast, adding largely to the knowledge of the physical features of the country. He had now arrived on the soil, and a penal settlement was formed (1788) at Port Jackson. In this way was laid the foundation of the future colony of New South Wales.

The Moreton Bay district (Queensland) was settled in 1825; in 1835 the Port Phillip district. In 1861 the latter district was erected into a separate colony under the name of Victoria. Previously to this time the colonies both of Western Australia and of South Australia had been founded—the former in 1829, the latter in 1836. The latest of the colonies is Queensland, which only took an independent existence in 1859.

The discovery of gold in abundance took place in 1851 and caused an immense excitement throughout the colony. In 1840 the population was then only about 350,000, and was slowly increasing; but the discovery of the precious metal started the country on a rapid career of growth, which has since been almost uninterrupted.

Convicts were long sent to Australia from the mother country, but transportation to New South Wales was discontinued in 1840, and the last convict vessel to Western Australia arrived in 1868. Altogether about 70,000 convicts were landed in Australia (besides smaller numbers of convicts). Owing to the discovery of gold, the population of Western Australia was so increased that responsible government was granted in 1893.

The record of the Australasian forms an interesting part of Australian history. This has been going on since early in the century, and is as yet far from complete.

The five Australasian states, comprising the five Australian states (heretofore colonies) and Tasmania, was sanctioned by the British Parliament on July 9, 1900, and proclaimed at Sydney on February 1, 1901. In 1905 the administration of the colony transferred to the Commonwealth, and, in 1908, a customs tariff act passed giving preferential rates to Great Britain.

**Austria-Hungary.**—The empire of Austria arose from the smallest beginnings at the end of the eighth century. In 796 a margrave, called the eastern mark (i. e., march or frontier-land), was founded as an outpost of the empire of Charlemagne, in the country of the Danube, and the name of *March*. The name *Oesterreich* appears first in 990.

In 1156 the mark was raised to a duchy; and after coming into the possession of the house of Habsburg in 1279, it rapidly rose to be a powerful state. The princes of that house extended their dominion by marriage, by purchase, and otherwise, over a number of other lands, including the crowns of Bohemia and Hungary; and from 1438 down to the nineteenth century they held almost without interruption the throne of the German empire (sacredly during the Holy Roman empire), the emperor being the most conspicuous, if not always the most powerful personage among the crowned heads of Europe.

In 1806 Francis declared himself hereditary Emperor of Austria, and two years afterward resigned the dignities of German emperor and king of the Romans. Thereafter, especially during the Holy Roman empire, the 50, Austria held the preëminence among German states; but after the victory of Prussia at Königgrätz (Sadova), in the short but bloody war of 1866, the position of Austria was excluded from Germany, and exclusion made final by the reconstruction of the German empire with the kings of Prussia as hereditary German emperors.

Since 1866 Austria has been occupied chiefly with the internal affairs of the empire. Hungarian demands for self-government were finally agreed to, and the empire of Austria divided into the two parts already mentioned—the Cisleithan and the Transleithan. This settlement was consummated by the coronation of the Emperor Francis Joseph I. at Budapest, as King of Hungary, on the 8th of June, 1867. In the same year the Concordat of 1855 came up for discussion, and measures were passed for the reestablishment of civil marriage, the emancipation of schools from the domination of the church, and the placing of different creeds on a footing of equality. The fact of the Austro-Hungarian dominions comprising so many

different nationalities has always given the central government much trouble, both in regard to internal and to external affairs. In regard to the "Eastern question," for instance, the action of Austria has been hampered by the sympathies shown by the Magyars for their blood relations, the Turks, while the Slavs have naturally been more favorable to Russia.

During the war between Russia and Turkey in 1877-8 Austria remained neutral; but at its close, in the middle of 1878, it was decided, at the Congress of Berlin, that the provinces of Bosnia and Herzegovina should in future be administered by Austria-Hungary instead of Turkey. Since that time the external history of the Austro-Hungarian monarchy

has been uneventful, but in internal affairs there has been considerable friction between the different nationalities and the numerous political parties. An anti-Semitic agitation assumed vast proportions in 1895, and resulted in the Czechs carrying the Bohemian diet. More internal unrest has recently been displayed in Austria-Hungary than in any other nation of Europe, Turkey excepted. In 1907-8 socialist demonstrations in favor of universal suffrage were frequent and impressive. In 1909 Bosnia and Herzegovina became absolute possessions.

## NOTABLE BATTLES OF UNIVERSAL HISTORY

Dates of events in this table are according to the Julian calendar (Old Style) until the promulgation of Gregorian calendar (New Style) in 1582. For events occurring within the limits of Great Britain the events are Old Style until the acceptance by Parliament of the Reformed calendar in 1752. In the seventeenth century the difference between the New Style and the Old was ten days, and in the eighteenth century eleven days. The victorious contestant is printed in bold-face type.

NAME OF BATTLE	DATE	APPROXIMATE LOCATION	CONTESTANTS	REMARKS
Abernberg ( <i>a'-ber-n-berg</i> )	1800, Apr. 20.....	Bavaria.....	French and Bavarians; Austrians	About 80,000 engaged on each side.
Aboukir ( <i>a-bou-keer</i> ), Battle of the Nile.....	1798, Aug. 1.....	Egypt.....	English; French.....	Nelson cut off Napoleon's return to Europe.
Aboukir.....	1799, July 25.....	Egypt.....	French; Turks.....	Two-thirds of Turkish troops killed.
Abydos ( <i>a-bi-dos</i> ).....	B. C. 411.....	Hellepont.....	Athenians; Peloponnesians.....	
Acragas ( <i>ak'-ra-gas</i> ), Siege of Acra ( <i>a'-ker</i> or <i>a'-ker</i> ), Siege of.....	B. C. 406..... 1169-1191.....	Sicily..... Syria.....	Carthaginians; Greeks..... Christians; Saracens.....	The citizens evacuated the fortress. Richard the Lion Hearted won renown by this siege.
Acra, Siege of.....	1799, Mar. 17.....	Syria.....	Turks; French.....	
Actium ( <i>ak'-shum</i> ).....	B. C. 31, Sept. 2.....	Greece.....	Augustus; Antony.....	At the critical moment Antony and Cleopatra sail away. Italians routed with enormous loss.
Adowa ( <i>ad'-o-va</i> ).....	1896, Mar. 1.....	N. E. Africa.....	Ethiopians; Italians.....	Italians routed with enormous loss.
Adrianople ( <i>ad'-ri-an-d'po</i> ).....	323, July 3.....	Thrace.....	Constantine; Licinius.....	Constantine gained empire.
Adrianople.....	378.....	Thrace.....	Visigoths; Romans.....	Emperor Valens defeated and slain.
Adwalton ( <i>ad'-wal-ton</i> ).....	1643, Jan. 30.....	England.....	Royalists; Parliamentarians.....	
Ægion ( <i>eg'-ion</i> ).....	B. C. 241.....	Sicily.....	Romans; Carthaginians.....	This victory put an end to the first Punic war.
Ægospotami ( <i>eg'-o-spot'-a-mi</i> ).....	B. C. 405.....	Thrace.....	Spartans; Athenians.....	Virtually ended Peloponnesian war.
Aghrim ( <i>ag'-rim</i> ).....	1691, July 12.....	Ireland.....	William III; James II.....	Irish savagely slaughtered.
Acinouret ( <i>ak'-shum-er</i> ).....	1415, Oct. 25.....	France.....	English; French.....	Great victory for Henry V.
Agratello ( <i>ag'-ra-tel-lo</i> ).....	1509, May 14.....	Italy.....	French; Venetians.....	One of the most disastrous battles in the history of Venice.
Argentum ( <i>ag'-ri-jen-tum</i> ), Siege of.....	B. C. 262.....	Sicily.....	Romans; Carthaginians.....	
Alamo ( <i>a'-la-mo</i> ), Storming of the.....	1836, Feb. 22.....	Texas, U. S. ....	Mexicans; Texans.....	Survivors put to the sword.
Albuera ( <i>al-bu-er'-ra</i> ).....	1811, May 16.....	Spain.....	British; French.....	Heavy losses on both sides.
Aleppo ( <i>al-lep'-o</i> ).....	638.....	Syria.....	Moslems; Syrians.....	Last serious resistance in Syria to the invading Moslems.
Alexandria ( <i>al-ek'-s-an-d'-ri-a</i> ), Siege of.....	638.....	Egypt.....	Moslems; Egyptians.....	Left Moslems masters of Egypt.
Alexandria, Bombardment of.....	1882, July 11-12.....	Egypt.....	English; Arabi Pasha.....	Fort totally destroyed. English occupy Egypt.
Algiers ( <i>al-jer'</i> ), Bombardment of.....	1816.....	Algiers.....	English and Dutch; Day of Algeria.....	Dutch agreed to total abolition of Christian slavery in his dominion.
Alia ( <i>al'-i-a</i> ).....	B. C. 390.....	Italy.....	Brennus and his Gauls; Romans.....	Rome left defenseless.
Alma ( <i>al'-ma</i> ).....	1843, Sept. 20.....	Crimea.....	English and French; Russians.....	British carried heights at the point of the bayonet.
Almanza ( <i>al-man'-sa</i> ).....	1707, Apr. 25.....	Spain.....	French; British and Portuguese.....	Spain lost to the allies.
Amphipolis ( <i>am-fip'-o-lis</i> ), Siege of.....	B. C. 422.....	Thrace.....	Spartans; Athenians.....	Both Brasidas and Cleon fell.
Anaquito ( <i>an-a-ki-to</i> ).....	1546.....	Peru.....	Pizarro; Viceroy Menes.....	Government of Peru fell into Pizarro's hands.
Angora ( <i>an-g'-ra</i> ).....	1402.....	Asia Minor.....	Tartars; Turks.....	Tartars said to have had 800,000 men.
Antietam ( <i>an-ti'-tam</i> ).....	1862, Sept. 17.....	Maryland, U. S. ....	*Confederates; Federals.....	Heavy losses on both sides. Lee's army greatly outnumbered.
Antioch, Siege of.....	1097-1098.....	Syria.....	Crusaders; Saracens.....	Defenders massacred.
Antwerp ( <i>ant'-werp</i> ).....	1578.....	Belgium.....	Spaniards; Walloons.....	Massacre of inhabitants known as the "Spanish Fury."
Aquæ Sextie ( <i>a'-ue-sek'-ti</i> ).....	B. C. 102.....	Gaul.....	Romans; Teutons.....	Cæsar Marius annihilates the barbarian army.
Arbola ( <i>ar-bol'-a</i> ).....	B. C. 331.....	Peria.....	Macedonians; Persians.....	This victory made Alexander master of Asia.
Arvola ( <i>ar-bol'-a</i> ).....	1790, Nov. 15-17.....	Italy.....	French under Napoleon; Austrians.....	Napoleon prevented the junction of two Austrian armies.
Arrot ( <i>ar-rot</i> ), Siege of.....	1751, Aug. 31-Nov. 15.....	India.....	English and Sepoys; French.....	Robert Clive held out ten weeks against a far superior force before being relieved.
Arguin ( <i>ar-guin</i> ).....	B. C. 406.....	Asia Minor.....	Athenians; Peloponnesians.....	Command of the sea temporarily restored to the Romans.
Arma ( <i>ar-ma</i> ).....	1588, July.....	English Channel.....	English; Spanish.....	Beginning of English sea-power.
Arzur ( <i>ar-zur</i> ).....	1191, Sept. 7.....	Syria.....	English Crusaders; Saracens.....	Great victory of Richard the Lion Hearted over Saladin.

†Beauchamp (bo'-cham).....	1690, June 30.....	England.....	French; English, Dutch.....	The French had been sent to create a diversion in favor of James II. in Ireland.
Belgrade (bel'-grid'), Siege of.....	1456, April.....	Serbia.....	Hungarians; Turks.....	John Hunyadi's last exploit.
Beneventum (ben-e'-ven-um).....	B. C. 275.....	Italy.....	Romans; Pyrrhus.....	Pyrrhus' last serious attack against the Romans.
Berezina (ber-eg'-a-sin).....	1812, Nov. 28.....	Russia.....	Russians; French.....	A most terrible disaster on the retreat from Moscow.
Bergen-op-Zoom (ber-eg'-on-op-zoom'), Siege of.....	1747.....	Netherlands.....	French; English, Dutch.....	French lost heavily in the siege.
Bibracte (bi-brak'-te).....	B. C. 58.....	Gaul.....	Romans; Helvetians.....	A defeat would have meant destruction to Cæsar.
Blenheim (blen'-im).....	1704, Aug. 13.....	Bavaria.....	British, Imperialists; French, Bavarians.....	Brilliant victory of Marlborough and Prince Eugene.
Borodino (bor-o-dy'-no), com-monly Anglicized, bor-bé'-no).....	1812, Sept.....	Russia.....	*French; Russians.....	One of the most bloody battles on record.
Bosworth Field.....	1485, Aug.....	England.....	Lancastrians; Yorkists.....	Richard III. slain; Henry Tudor becomes Henry VII. of England.
Bouvines (bo'-vin).....	1214.....	Flanders.....	French; Flemish, English, Germans.....	Secured the position of Philip Augustus on the throne of France.
Bovianum (bo-vi'-num), Siege of.....	B. C. 305.....	Italy.....	Romans; Samnites.....	End of second Samnite war.
Boyle (boi), river.....	1690, July 1.....	Ireland.....	William III.; James II.....	Irish under James II. totally defeated.
Brettenfeld (bri'-en-feld).....	1631, Sept. 7.....	Germany.....	Swedes, Saxons; Imperialists.....	Brilliant victory of Gustavus Adolphus over Tilly.
Brettenfeld.....	1642.....	Germany.....	Swedes; Imperialists.....	Victory of Turenne over Piccolomini.
Brill, Capture of.....	1572.....	Holland.....	Netherlanders; Spanish.....	The first success of the Netherlanders.
Buena Vista (bo'-na-vis-ta), Battle of.....	1847, Feb. 22-23.....	Mexico.....	Americans; Mexicans.....	General Zachary Taylor victorious over much larger force.
Bull Run.....	1861, July 21.....	Virginia, U. S. A.....	Confederates; Federals.....	The first important battle of the Civil war.
Bunker's Hill.....	1773, June 17.....	Mass., U. S. A.....	British; Americans.....	Though dislodged from their position, the British won a practical victory.
Byzantium (bi-zan'-ti-um), Siege of.....	1453, July 17.....	Thrace.....	Constantines; Lelinius.....	Byzantium re-founded as Constantinople, the capital of the empire.
†Cadix (ka'-dis, Sp. ka'-dik).....	1587.....	Spain.....	English; Spanish.....	Here Drake "singd the King of Spain's beard."
Calais (Fr. ka'-la) Siege of.....	1346-1347.....	France.....	English; French.....	Calais remained in English possession until 1558.
†Camperdown (kam-per-down).....	1797, Oct. 11.....	Holland.....	British; Dutch.....	The Dutch fleet, allied with France, was practically destroyed.
Cannæ (kan'-e).....	B. C. 216.....	Italy.....	Carthaginians; Romans.....	Hannibal inflicts one of the most disastrous defeats the Romans ever suffered.
†Cape St. Vincent.....	1797, Feb. 14.....	Portugal.....	British; Spanish.....	Spanish fleet, allied with France, beaten by Admiral Jervis.
Capua (kap'-u-a, It. ka'-pu-a), Siege of.....	B. C. 211.....	Italy.....	Romans; Capuans and Carthaginians.....	Hannibal was unable to break through Roman lines and relieve the city.
Carrhae (kar'-e).....	B. C. 53.....	Mesopotamia.....	Parthians; Romans.....	Cressa, one of the triumvirs, defeated and shortly after slain.
Carthage (kar'-thaj), Siege of.....	B. C. 146.....	N. Africa.....	Romans; Carthaginians.....	Carthage ruined to the ground.
Castillon (ka'-sti-yon).....	1453, July 17.....	France.....	French; English.....	This victory ended the Hundred Years' war.
†Catana (ka'-da-na).....	B. C. 287.....	Sicily.....	Carthaginians; Syracusans.....	Syracusans utterly routed. Carthaginians besieged Syracuse.
Caudine (ka'-din) Forks.....	B. C. 321.....	Italy.....	Samnites; Romans.....	The whole Roman army was "sent under the yoke."
Cawnpore (kan'-por).....	1857, Dec. 6.....	India.....	British; Mutineers.....	Sir Colin Campbell routed mutineers.
Cheronæa (ker-ba'-na).....	B. C. 338.....	Greece.....	Macedonians; Athenians and Thebans.....	Philip of Macedon wins hegemony of Greece.
Chalons (sha'-lon).....	451.....	France.....	Romans and Visigoths; Huns.....	Attila retreated and western Europe was saved from the Huns.
Chattanooga (cha-ta'-na-ga).....	1863, Nov. 24-27.....	Georgia, U. S. A.....	Federals; Confederates.....	The "Battle above the Clouds" fought on Lookout Mountain.
Chickamauga (chik-a-ma-ga).....	1863, Sept. 19-20.....	Tenn., U. S. A.....	Confederates; Federals.....	Federal losses 16,000; Confederate about 12,000.
Chiosgia (chi-og'-ia), Blockade of.....	1380, Jan.-June.....	Venetia.....	Venetians; Genoese.....	Loss of this city broke the power of the Genoese republic for many years.
Chotusitz (cho'-tus-it).....	1742, May 17.....	Bohemia.....	Prussians; Austrians.....	This victory led Austria to sign the peace of Breslau, June 11, 1742.
Clusium (hi'-shi-um).....	B. C. 275.....	Italy.....	Gauls; Romans.....	Romans said to have lost 25,000.
†Cnidus (ni'-du).....	B. C. 394.....	Asia Minor.....	Athenians and Persians; Spartans.....	Sparta lost her recently gained maritime ascendancy.
Colenso (ka'-len-so).....	1899, Dec. 15.....	S. Africa.....	Boers; British.....	First action in Buller's campaign for the relief of Ladysmith.
†Constantinople (kon-stanti-nop'-le), Siege of.....	B. C. 52.....	Rome.....	Optimates; Democrats and Samnites.....	Sulla's victory ended the Roman civil war.
†Constantinople (kon-stanti-nop'-le), Siege of.....	1204.....	Thrace.....	Crusaders and Venetians; Greek empire.....	Baldwin of Flanders becomes Latin emperor of the East.

Mytilene (mü'ti-le).....14	B. C. 260.....	Sicily.....	Romans; Carthaginians.....	First naval victory of Romans; due to boarding bridges.
Näfels (nä-fels).....	1388, April 9.....	Switzerland.....	Swiss; Austrians.....	Habsburgs renounced all feudal claims over the Swiss cantons (1389).
Nancy (nan'-ä).....	1477, Jan. 5.....	Lorraine.....	Swiss; Charles the Bold.....	Charles was slain, leaving his motley territories over to William III.
Narva (nä-rä).....51	1700, Nov. 30.....	Russia.....	Swedes; Russians.....	Charles XII won a brilliant victory over the much larger army of Peter the Great.
Naseby (nä-sä).....48	1645, June 14.....	England.....	Parliamentarians; Royalists.....	Complete defeat of Charles I., followed by the general ruin of his cause.
Naupactus (nä-pak'tus).....7	B. C. 429.....	Gulf of Corinth.....	Athenians; Peloponnesians.....	Victory wrested from defeat by the genius of Themistocles, the Athenian commander.
Navarino (nä-vä-rä).....58	1827, Oct. 20.....	Greece.....	English; French and Russians; Turks.....	Destruction of Turkish naval power; Ibrahim retreats from Morea.
Navas de Tolosa (nä-fä).....34	1212, July 16.....	Spain.....	Spaniards; Moors.....	Islamic supremacy and preponderance of Christianity in Spain.
Neerwinden (nä-vin-den).....49	1693, July 24.....	Belgium.....	French; English.....	The French won a brilliant but barren victory over William III.
Neville's (nä-vil's) Cross.....39	1246, Oct. 17.....	England.....	English; Scots.....	Scots crushed at home, while Edward III. was winning Crécy.
New Orleans (drü-nans).....57	1815, Jan. 8.....	Louisiana (U. S. A.).....	Americans; British.....	On account of a miscommunication, Jackson fought this battle after peace had been made.
Niema (ni-nä).....36	1067.....	Asia Minor.....	Crusaders; Turks.....	First conquest of crusaders in the East.
Nicopolis (ni-kop'-olis).....	B. C. 66.....	Asia Minor.....	Pompey; Mithradates.....	Mithradates' last fight against the legions of Rome.
Nördlingen (nörd'-ling-en).....47	1634, Sept. 6.....	Bavaria.....	Catholics and Imperialists; Swedes and German Protestants.....	One of the most bloody and decisive battles of the war; followed by the peace of Prague.
Northampton (nörth-amp'ton).....42	1460, July 10.....	England.....	Yorkists; Lancastrians.....	Capture of Henry VI.; fight of Queen Margaret and her son to Scotland.
Numantia (nä-man'-shi-ä).....	B. C. 142-133.....	Spain.....	Romans; Celtiberian tribes.....	Inhabitants sold as slaves.
Obbligato (obli'-gä-to).....	1845, Nov. 28.....	Argentina.....	British and French; Argentines.....	Over the opening the waters of the Paraná to the shipping of all nations.
Orontas (ör'-ontas).....53	1758, May 27-July 1.....	Moravia.....	Austrians; Prussians.....	General Daun forced Frederick the Great to raise the siege and retire.
Orleans (ör'-ä-lä).....39	1428-9, Oct. 12-May 8.....	France.....	French; English.....	Joan of Arc saves France by driving back English and crowns Charles VII. at Rheims.
Ostend (ot-end).....46	1601-4, July-Sept.....	Belgium.....	Spaniards; Dutch garrison and inhabitants.....	Scarcely a house in the town left standing; Spaniards lost 70,000.
Ostroleka (ot-roleng'-kä).....	1831, May 26.....	Poland.....	Russians; Poles.....	Poland becomes a province of the Russian empire (1832).
Otterburn (ot'er-bürn).....	1388, Aug. 10.....	England.....	Scots; English.....	The ballad of Chevy Chase deals with this battle.
Otumba (öt-üm-bä).....	1320, July 8.....	Mexico.....	Cortes; Aztecs.....	Two hundred Spanish horsemen rout an immense army and make good their retreat.
Oudenarde (ou-de-nä-rä).....50	1708, July 11.....	Belgium.....	English and Imperialists; French.....	One of the great victories of Marlborough.
Palmira (pal-mi-rä).....	272-273.....	Syria.....	Romans; Queen Zenobia.....	City saved by Scipio Aemilianus and its inhabitants sold as slaves.
Palo Alto (pä-lä-dil'-to).....59	1846, May 8.....	Mexico.....	Americans; Mexicans.....	Palmira destroyed and Zenobia taken captive to Rome.
Panormus (pa-nör'-mus).....41	B. C. 251.....	Sicily.....	Romans; Carthaginians.....	Mexicans completely routed at small cost to the victors.
Paris (pä-rä).....66	1870-1, Sept. 10-Jan. 28.....	France.....	Prussians; French.....	Brilliant victory restored confidence to Republicans; demonstrated value of elephants in warfare.
Pavia (pä-vä).....43	1525.....	Italy.....	France.....	City reduced to desperate conditions through Emperor Charles V. and Francis I. of France.
Pharsalus (fär-nä-lus).....24	B. C. 48.....	Greece.....	Cæsar; Pompey.....	The capture of Francis was followed by the peace of Madrid, which, however, was soon repudiated.
Philippi (ä-dip'-i).....24	B. C. 42.....	Thrace.....	Antony and Octavius; Brutus and Cassius.....	The West and the new monarchy completely triumphed over the East and the old republic.
Pinkie (ping'-ä).....	1547, Sept. 10.....	Scotland.....	English; Scots.....	Cassius and Brutus committed suicide following their defeat.
Plassy (pläs'-ä).....53	1757, June 23.....	India.....	English; Bengalees.....	Scots thrown into the arms of France and the little queen, Mary, married to the dauphin.
Plataea (plä-tä-ä).....5	B. C. 479.....	Greece.....	Greeks; Persians.....	Established English control in Bengal and ultimately in all India.
				Won by the discipline and prowess of the Spartan hoplites.

## NOTABLE BATTLES OF UNIVERSAL HISTORY—Continued

NAME OF BATTLE	DATE	APPROXIMATE LOCATION	COMBATANTS	REMARKS

Rome, Storm of.....	1527, May 6.....	Italy.....	Mutinous Army of Charles V.; Papal troops.....	For fourteen days Genesio's Vandals plundered Rome.
Rome, Siege of.....	1849, June 4-July 3.....	Italy.....	French and Papalists; Roman Republicans.....	Made the end of the artistic, pleasure-loving Rome of the Renaissance.
Roncesvalles (ró-n-cho-vál'-es).....	778.....	Spain.....	Basques; Franks.....	The republic, founded by Maximal, overthrown and Pope Pius IX. restored.
Roosebeck (róo-bek).....	1382, Nov. 27.....	Flanders.....	French; Flemings.....	Death of Charlemagne's paladin, Roland (Chanson de Roland).
Rossbach (róo-bak).....	1757, Nov. 5.....	Saxony.....	Prussians; French and Austrians.....	A great triumph for the nobles against the cities.
Rouen (róo-an), Siege of.....	1418-9, June-Jan.	France.....	English; French.....	Makes Frederick the Great a national hero of Germany.
Rapriortis (rá-pí-rí-ó-rí-tis).....	B. C. 82.....	Italy.....	Optimates; Democrats.....	Because of its desperate resistance, Henry V. granted the city honorable capitulation.
Ragunum (rá-gu-núm), Siege of.....	B. C. 219.....	Spain.....	Carthaginians; Inhabitants.....	Followed by Sulla's reign of terror.
St. Albans (sán-tí-á-lbans).....	1455, May 22.....	England.....	Yorkists; Lancastrians.....	Capture of this city by Hannibal the chief cause of the second Punic war.
Salamanca (sál-dá-mang-ká).....	1812, July 22.....	Spain.....	British; French.....	The first battle of the war of the Roses; Yorkists defeated here in a second battle (1460).
†Salamis (sál'-á-mis).....	B. C. 480, Sept. 20.....	Greece.....	British; French.....	This rout of the French lost them all their eastern empire.
San Jacinto (sán-já-sín-tí).....	1836, April 2.....	TEXAS, U. S. A.....	Greeks; Persians.....	This rout of the French lost them all their eastern empire.
†Santiago (sán-tí-á-gí).....	1898, July 3.....	Cuba.....	Texan rebels; Mexicans.....	Thermopylae great victory followed by "Xerxes" withdrawal to Asia.
Sargassos (sá-rá-sos), Siege of.....	1808-9, Dec.-Feb. 21	Spain.....	Americans; Spaniards.....	Santa Anna captured by General Houston.
Saratoga (sá-rá-tó-gá).....	1777, Oct. 7.....	New York U. S. A.....	British; French.....	Fleet of Admiral Cervera totally destroyed.
Sea of Japan.....	1905, May 27-29.....	Sea of Japan.....	British; French.....	An important success which broke the spell of French invincibility.
Sebastopol (sé-bás-tó-pól), Siege of.....	1854-5, Sept. 26-Sept. 9.....	Crimes.....	Americans; British.....	Followed (Oct. 17) by the surrender of Berezova, which was the turning point of the war.
Sedan (sá-dán).....	1870, Sept. 1.....	France.....	French, British and Sardinians; Russians.....	Russia's naval power destroyed.
Shipka (ship-ká) pass.....	1877, Aug. 20-23.....	Bulgaria.....	Prussians; French.....	Brought to a close the active operations of "Crimean war."
Sempach (sem-pák).....	1386, July 9.....	Switzerland.....	Russians; Turks.....	Followed by the surrender of Napoleon III. with an army of 84,000 men.
Sentinio (sem-tí-nío).....	B. C. 295.....	Italy.....	Russians; Turks.....	Russians held this strategic position against kindred violence of the Turks.
Seringapatam (ser-ing-pá-tám), Siege of.....	1799, Apr. 24-May 4	India.....	Swiss; Austrians.....	Celebrated for the heroic devotion of Arnold von Winkelried.
Shiloh (shí-ló).....	1862, April 6 and 7.....	Tenn., U. S. A.....	Romans; Samnites and Gauls.....	Failure of the coalition to crush Rome from the north.
Shrewsbury (shréw-ber-í).....	1403, July 21.....	England.....	British; Tippoo Sahib.....	With Bonaparte's failure in Egypt, this battle foils French designs on India.
			Federals; Confederates.....	Defeated in the first day's fighting. Grant turned the tables the second day.
			Henry IV.; Percies.....	Hotspur defeated and slain.

## NOTABLE BATTLES OF UNIVERSAL HISTORY—Continued

NAME OF BATTLE	DATE	APPROXIMATE LOCATION	CONTESTANTS	REMARKS
Trebia ( <i>tré-bi-d</i> )	218, Dec.	Italy	Carthaginians; Romans	By this splendid victory Hannibal justified his march into Italy; the way into Etruria was now open to him.
Tunis ( <i>tú-nis</i> ). Siege of	1270.	N. Africa	Moslems; French Crusaders	This crusade, in which Louis IX. lost his life, was the last.
Turin ( <i>tú-rin</i> )	1706, Sept. 7.	Italy	Prince Eugene; French	The French were permanently excluded from Italy.
Tyrrhene ( <i>tir</i> ). Siege of	B. C. 332, Jan.-Aug.	Phoenicia	Macedonians; Tyrians	The greatest of Alexander's triumphs; Alexandria in Egypt took the place of Tyre as a commercial metropolis.
Ushant ( <i>ush-ant</i> )	1794, June 1.	N. Atlantic	British; French	A brilliant victory won by Lord Howe.
Valmy ( <i>val-mí</i> )	1793, Sept. 2.	France	French; Prussians	Goethe said that from Valmy dates a new era. It showed that revolutionary France would and could resist Europe.
Varna ( <i>vár-na</i> )	1444, Nov. 10.	Bulgaria	Turks; Hungarians	King Ladislaus lost his life and his army was scattered to the winds.
Verceil ( <i>ver-cel</i> )	B. C. 101, July 30.	Italy	Romans; Cimbri	Marius and Catulus utterly destroyed the vast barbarian horde, which had been threatening Italy with invasion.
Vicksburg, Siege of	1863, May 19-July 4.	Miss., U. S. A.	Federals; Confederates	Grant's success at Vicksburg, together with the battle of Gettysburg, were the turning points of the war.
Vienna ( <i>vé-en</i> ). Siege of	1683, July 14-Sept. 12	Austria	Austrians; Turks	The besiegers were reduced to the last extremity when Sobieski intervened and put the invading Turks to flight.
Vigo ( <i>ví-gó</i> ) bay	1702, Oct. 12.	Spain	English and Dutch; French and Spaniards	The destruction of the Spanish galleons and the protecting French fleet gave a blow to the finances and prestige of the two crowns.
Vimiero ( <i>ví-mí-er</i> )	1813, Aug. 21.	Spain	British; French	Wellington inflicted a signal defeat on the French, but his senior officer made no use of the victory.
Vitoria ( <i>ví-tó-rí</i> )	1813, June 21.	Spain	British; French	This, the crowning victory of Wellington's peninsular campaign, won Spain from Napoleon.
Wagram ( <i>wá-grám</i> )	1809, July 6.	Austria	French; Austrians	One of the most terrible and least decisive battles of all time.
Wakefield	1460, Dec. 30.	England	Lancastrians; Yorkists	Queen Margaret's army completely defeated that of the duke of York, who was slain on the battlefield.
Wandewash ( <i>wán-de-wash</i> )	1760, Jan. 22.	India	British; French	Cook's victory was the death-blow to French power in India.
Warsaw ( <i>wár-sá</i> ). Siege of	1831, Aug. 19-Sept. 7	Poland	Russians; Poles	The fall of Warsaw ended the Polish insurrection and Poland becomes a province of the Russian empire.
Waterloo ( <i>wá-ter-ló</i> )	1815, June 18.	Belgium	British and Prussians; French	The final overthrow of Napoleon by Wellington and Blücher. Napoleon was transported to St. Helena, where he died in 1821.
Watre ( <i>wá-tr</i> )	1815, June 18.	Belgium	French; Prussians	Grouchy's victory was useless, while he was to have saved the day for Napoleon had he arrived at Waterloo who expected.
Wei-hai-Wei ( <i>wéi-hái-wéi</i> )	1894, Jan. 30-Feb. 12.	China	Japanese; Chinese	The Chinese admiral gave up the remnant of his fleet and killed himself, followed by negotiations for peace.
Westerlo ( <i>wéi-ter</i> )	1651, Sept. 3.	England	Cromwellians; Scottish Royalists	Followed by the submission of Scotland and Charles II.'s adventurous escape to France.
Würzburg ( <i>wúr</i> )	1870, Aug. 6.	Bavaria	Prussians; French	A bloody contest and a decisive victory, followed by the retreat of the French from southern Germany.
Xerxes ( <i>hí-rís</i> )	711, July 19.	Spain	Moor; Visigoths	Without having to fight any second battle, the Moors under Tariq defeated Spain.
Yalu ( <i>yá-lá</i> ) river	1894, Sept. 17.	Manchuria	Japanese; Chinese	This action conferred upon the Japanese the full command of the sea and greatly aided the land-power.
Yorktown, Siege of	1781, Sept. 30-Oct. 19	Va., U. S. A.	Americans; British	The surrender of Cornwallis at Yorktown practically brought to an end the war of the American Revolution.
Zama ( <i>zá-má</i> )	B. C. 202.	N. Africa	Romans; Carthaginians	Scipio defeated Hannibal and annihilated his army, thus ending the second Punic war.
Zorndorf ( <i>zór-dorf</i> )	1758, Aug. 25.	Prussia	Prussians; Russians	A desperate and bloody struggle, after which the Russians retired into Poland.
Zurawno ( <i>zú-raw-no</i> ). Siege of	1676.	Austria	Poles; Turks	John Sobieski made a heroic defense against numbers and won an honorable peace.

**Belgium.**—In the time of the Romans the name *Gallia Belgica* was given to the Southern Netherlands lying on the confines of Gaul and Germany, peopled by Celtic and German tribes. Until the close of the eleventh century the feudal system, which arose at the fall of the Carolingian dynasty, prevailed in the Netherlands, where the several southern provinces were made duchies and counties. After the abdication of Charles V. these provinces passed into the hands of Philip II., and by the law of primogeniture should have

remained united with Spain. But scarcely had the peace of Chateau-Cambresis put an end to the encroachments of France, when the religious disputes of the Reformation, and the despotic measures of Philip, excited in the provinces a long and bloody war for civil and religious freedom, which ended in the independence of the Northern or Protestant Netherlands, while the Southern endured a long conflict with the Spanish, and, afterward, French authorities.

The kingdom of Belgium originated in 1830,

by the secession from the kingdom of the Netherlands of its southern provinces, the former Austrian Netherlands and the bishopric of Liège. A provisional government was formed, and was acknowledged by the whole of Belgium. The resolution of the Dutch Parliament that Belgium and the Netherlands should be separately administered, but under the same king, came too late to check the revolution. The crown of the new kingdom was offered to Leopold of Saxe-Coburg, husband of the Princess Charlotte of Eng-

and uncle of Queen Victoria, and accepted by him in 1831. In the ensuing struggle the Dutch forces defeated the Belgians; but the latter were speedily supported by a French army, and the Dutch and French fleets, by British and French fleets. King William had, therefore, to recognise the inevitable, and Belgium became definitely (1832) a separate kingdom. In 1849 a new commercial treaty for ten years was concluded with France, and the duration of the treaty with the German Zollverein was lengthened.

Leopold II. succeeded to the throne in 1865. In recent years the chief feature of Belgian politics has been a keen struggle between the clerical and the liberal party. Till 1878 the clerical party maintained the upper hand, but to a large extent the clerical party at the elections. In 1877 a bill was passed to put down corruption, and to increase the number of towns deputies to the chamber of representatives; and at the next elections in June, 1878, the liberals gained a majority, which they lost in 1884. The clerical party continued in power till 1894, when it again obtained a large majority, and a bill giving an extension of the franchise was passed. Recent years have been marked by socialist movements and labor troubles. Leopold II. died in 1909, and was succeeded by Albert.

**References.**—*Bouquier's History of Belgium; Sanderson's Belgium and the Belgians; Smythe's History of Belgium; Vincent's Constitution of Belgium.*

**Bolivia.**—Bolivar, the liberator of Bolivia, drew up a constitution, which was adopted in the year 1827. This constitution, which was exceedingly complicated, vested the executive power in a president for life, with the privilege of naming his successors; and the legislative function in three bodies, a senate, tribunes, and censors. The code and constitution of Bolivar were soon after abandoned and the latest constitution bears the date 1860. But the constitution has rarely been observed, and to assert itself peacefully, the history of Bolivia, from the presidency of Gen. Santa Cruz (1828-39), being a record of military insurrections, the victor for the time being making himself supreme.

In 1836 a federal republic was formed, consisting of three states, North Peru, South Peru, and Bolivia, with Santa Cruz as common protector, but the protector was overthrown in 1839, and the confederation dissolved. In 1841 Peru made war upon Bolivia, but the Peruvian president was defeated and killed at the battle of Yaguai, and peace was soon after restored. During the succeeding period, up to the war with Chili, only two presidents were regularly elected, Dr. Linarez, in 1858, and Col. Ballivian, in 1875.

In 1879 began the disastrous war with Chili, its cause being the disputed possession of the rich nitrate region of Atacama, on the Pacific coast, Bolivian territory, but which had been seized, and its deposits worked, by Chili. In the war that followed Bolivia and its ally, Peru, were decisively beaten, and as a result of the war the nitrate region was annexed to Chili, and Bolivia deprived of the province of Pedro Alvarado.

A boundary dispute with Brazil as to the territory of Acre was settled in 1903, when, in return for Upper Acre, Upper Jurua, and Upper Jurua, Bolivia accepted territory on the frontier of Matto Grosso and the river Madeira (1,221 square miles), together with a money payment of \$10,000,000, and commercial facilities. An important railway connecting Brazil and Bolivia was opened in 1909.

**References.**—*Suarez's Notes on Bolivia; Conway's Bolivian Andes; Mathews' Through Bolivia.*

**Brazil** was discovered in 1499 by Vicente Yanez Pinzon, one of the companions of Columbus in the service of Spain, and next year was taken possession of by Pedro Alvarez Cabral on behalf of Portugal. The first governor-general was Thome de Sousa, who in 1549 arrived in the Bay of Bahia and established the new city of Brazil, making it the seat of his government.

The usurpation of the crown of Portugal by Philip II. left Brazil in a defenseless and neglected condition, and the English, French, and Dutch made successive attempts to obtain a footing. The Dutch were the most

persevering, and for a time almost divided the Brazilian territory with the Portuguese. The tyranny of the Dutch governors, however, incited their native and Portuguese subjects to revolt, and after a short war, in 1654 the Dutch were driven out and the Portuguese remained masters of an undivided Brazil. The value of Brazil to Portugal continued steadily to increase after the discovery of the gold mines in 1698 and the discovery of the diamond mines in 1728.

The vigorous policy of the Portuguese monarchs, and the influence of the Marquis de Pombal (1760-77) did much to open up the interior of Brazil, though his high-handed modes of procedure left among the Brazilians a discontent with the home government which took shape in the abortive revolt of 1789.

On the invasion of Portugal in 1808 by the French the sovereign of that kingdom, John VI. fled to Brazil, accompanied by his court and a large body of emigrants. He raised Brazil to the rank of a kingdom, and assumed the title of king of Portugal and Brazil, and on his return to Portugal he found the Portuguese cortes unwilling to grant civil and political equality to the Brazilians—a fact which raised such violent conclusions in Rio de Janeiro and other parts of Brazil, that Dom Pedro, the king's son, was forced to head the party resolved to make Brazil independent, and in 1822 a national assembly declared the separation of Brazil from Portugal, and appointed Dom Pedro the constitutional emperor.

In 1864 began a severe struggle between Brazil and Paraguay, caused principally by the arbitrary conduct of Lopez, the dictator of Paraguay. Brazil, though joined by Uruguay and the Argentine Confederation, had to bear the brunt of the war, which terminated only with the death of Lopez in 1870. This struggle was attended with an immense expenditure of men and money to Brazil, but it established her reputation as a great power, and secured the freedom of the navigation of the Rio de la Plata river system.

In 1871 an act was passed for the gradual emancipation of slaves, and in 1888 slavery was finally abolished. In 1889 took place the revolution and establishment of the republic. The provisions of the president Fonseca led to a revolutionary movement in 1891, which was not quelled without difficulty, and Rio de Janeiro was several times bombarded. In 1906-7 Brazil took the lead in an effort to reach a better understanding among the countries of North and South America. A great demonstration was given by the city of Rio de Janeiro, in 1908, to the United States Pacific squadron. Hermes da Fonseca became president in 1910.

**Bulgaria.**—The Bulgarians belonged originally to the Uraltic stock, but have adopted a Slavic dialect. First crossed the Danube in the sixth century A. D., by 1186 they had split into three principalities, and from 1393 fell under the domination of the Turks. In 1906-7 Bulgaria took the lead in an effort to reach a better understanding among the countries of North and South America. A great demonstration was given by the city of Rio de Janeiro, in 1908, to the United States Pacific squadron. Hermes da Fonseca became president in 1910.

In 1885 a national rising took place in eastern Roumelia, the Turkish governor was expelled, and union with Bulgaria proclaimed. In consequence, Servia demanded an addition to her own territory, and in 1885, began a war against Bulgaria, in which she was severely defeated. By the treaty which followed, the Prince of Bulgaria was appointed governor-general of eastern Roumelia for a term of five years, to be re-nominated at the end of the term.

These events greatly irritated Russia, whose agents managed to seduce certain regiments of Bulgarians; and in August, 1886, the prince was seized and carried off, whereupon a proclamation was issued to the effect that he had been executed. When he was set free on Austrian

territory he discovered that the people were still with him, and determined to return. Seeing, however, that his presence would cause an immediate interference on the part of Russia, he formally abdicated and left the country (1886). In 1887 Prince Ferdinand of Saxe-Coburg accepted an invitation to occupy the throne; but his position was insecure till the six great powers sanctioned the step taken by him.

**References.**—*Dixon's The Present State; Samuelsen's Bulgaria; and Fraser and Miller's The Balkans; Herbert's Bulgaria and the Balkans.* **Canada** is said to have been discovered by Sebastian Cabot in 1497. In 1535 it was taken possession of by Jacques Cartier, in the name of Francis I., and called New France. In 1542, La Roque of Roberval, at no great distance from Quebec, founded the fort of Charlesbourg; and in 1608, Samuel Champlain said the foundation of Quebec. In 1617 a French expedition was formed to explore the colony; after which the English made several attempts between 1689 and 1711, without much success.

In 1754 the war between France and England broke out, and continued till between 1760-60, when Canada was conquered by the British, and definitely ceded to them by the treaty of Paris. The chief events of this war was the taking of Quebec, in 1759, where the French general, Montcalm, and the British leader, Wolfe, both fell, mortally. In 1776, during the American war of independence, Canada, in 1775, was invaded, but without success. In 1791 an act of Parliament divided Canada into two provinces—an upper and a lower Canada.

In 1812, during the second American war, Upper and Lower Canada were the scenes of frequent combats between the British and Americans. In 1837 and 1838 both provinces were shaken by a violent insurrectionary movement, which was finally quelled. The two provinces were again united in 1841. In 1858 Ottawa was finally selected as the capital of Canada, the observance being referred to the queen of England.

During these years the population of Upper Canada, or Ontario, had been rapidly increasing, and now exceeds that of Lower Canada or Quebec by nearly 300,000. Under the old constitution, however, the two provinces had equal representation in the legislature. Hence a demand arose on the part of the Upper Canadianists for a more equitable representation. This demand was practically conceded in a scheme of federation of the British North American colonies approved of by the Canadian Parliament at Quebec in 1865 and forwarded to the imperial government for approval. In 1866 the reciprocity treaty with the United States having expired, the government of that country practically refused to renew it except on the most disadvantageous terms for Canada. About the same time a Fenian movement against Canada, originating in the United States, began to be heard of. Gangs of desperadoes, mostly from Canada, crossed the frontier, collected near the frontier, and ultimately crossed, occupying some villages and plundering the neighborhood. But the promptustering of Canadian volunteers made the filibusters recross the frontier in some haste, to be ultimately disarmed and dispersed by United States troops.

In 1867 the British North America act for confederation of the colonies was passed by the British Parliament. It united Upper Canada, or Ontario, Lower Canada, or Quebec, New Brunswick, and Nova Scotia, into one territory, to be named the Dominion of Canada. Newfoundland was declared an associate province in confederation, but with that exception all the British territory north of the United States was gradually included within the Dominion. Hudson's Bay company's territory by purchase in 1868, British Columbia in 1871, Prince Edward Island in 1873.

In 1870 an insurrection of the Red river settlers led to a declaration of war as to how the titles to their lands might be affected by thecession of the Hudson's Bay company's rights, took place under the leadership of Louis Riel, and had to be suppressed by a military expedition under Colonel (now Viscount) Wolseley. To reassure the settlers

a part of the newly-purchased territory was erected into an independent province under the name of Manitoba, the organized territory beyond receiving the name of the Northwest Territory.

In 1871 the Washington treaty arranged that the fisheries of both Canada and the United States should be shared equally for the next twelve years, Canada receiving a compensation, afterward fixed at five and a half million dollars, for its fisheries.

In 1884 considerable disturbance was caused among the half-breeds and Indians in the Saskatchewan and Assiniboine districts on account of the difficulty of obtaining valid titles to their lands. The discontent at length took shape in an insurrection which Louis Riel was invited to head. The rebels seized the government stores at Duck Lake and induced some of the Indian tribes to cooperate with them; with the result that a massacre of settlers took place at Frog's lake. Within a few months an expedition under Gen. Middleton, who had under his command several thousand volunteers, suppressed the rebellion. One hundred were arrested. Riel was tried and executed at Regina on July 28, 1885.

On November 7th of the same year the Canadian Pacific railway (which see) was completed, being opened for through traffic the following year. Since 1883, when the Washington treaty expired, disputes between the American and Canadian fishermen have again been frequent, and several American fishing vessels have been seized on the Canadian coast, and others prevented from buying bait. A joint British and American commission was instituted in 1887, for the adjustment of differences, but no final settlement has yet been arrived at. The seal fishing in Behring's Sea also caused friction with the United States, but this matter, as well as the boundary between Canada and Alaska, was adjusted in 1903. The year 1905 marked the formation of several new provinces. In September, 1905, a serious riot, directed against the Japanese and Chinese, broke out in Vancouver, largely organized by American labor agitators, but supported by local malcontents. The Dominion authorities suppressed the outbreak.

**Chili.**—Prior to the Spanish conquest, Chili belonged to the Peruvian Incas. In 1535 Pizarro sent Almagro to invade the country, and in 1540, Valdivia, the latter of whom subjugated most of the country excepting Araucania. The revolution which separated the colony from Spain broke out in 1810, and in 1817 the victory of Maipu, gained by General San Martin, permanently secured the independence of Chili. In 1865 Chili joined Peru in a war against Spain, in which Valparaiso was bombarded and suffered great loss. Peace was obtained through the mediation of the United States in 1869.

In 1879 a war broke out with Bolivia and Peru, in reference to the rights of Chili in the mineral districts of Atacama. This war was virtually finished in 1881, and the victorious Chileans gained a large accession of territory from both Bolivia and Peru. From the year of 1879-80 it was in Peru that the peace and prosperity till 1891, when owing to President Balmaceda's aiming at dictatorial powers, a rebellion broke out which ended in Balmaceda's defeat. Boundary disputes with Argentina were referred to British arbitration and arranged in 1898. In 1907 a number of labor disturbances in the mining regions called for armed intervention.

**China.**—Chinese historical documents begin with the reigns of Yao and Shun (2336-2206 B. C.). In 403 B. C. we find only seven great states, all sooner or later claiming to be 'the kingdom,' and contending for the supremacy; till Tsin (China) put down all the others, and

in 221 B. C. its king assumed the title of Hwang Ti, or emperor. From that year dates the imperial form of the government.

The changes of dynasty have been many, two or more sometimes ruling together, each having but a nominal supremacy over the whole nation. The greater dynasties have been those of Han (206 B.C.-220 A.D.), Tang (618-906), Sung (960-1279), Yuan (the Mongol, 1280-1367), the Ming (1368-1643), and the Ching (Manchou-Tartar), from the Manchou conquest of China in 1643 to the present date.

It was not till after the Cape of Good Hope was doubled, and the passage to India discovered by Vasco da Gama in 1497, that intercourse between any of the European nations and China was possible by sea. It was in 1516 that the Portuguese first made their appearance at Canton; and they were followed at intervals first by the Spaniards, the Dutch, and the English in 1655. The Chinese received none of them cordially; and Chinese dislike of them was increased by mutual jealousies and collisions.

As maritime trade with the west increased, and there grew up the importation of opium from India. Before 1767 the import rarely exceeded 200 chests, but in that year it amounted to 1,000. In 1792 the British government sent an embassy under Lord Macartney to Peking. A second embassy from Great Britain in 1816 was dismissed from Peking suddenly and contemptuously because the ambassadors would not perform the prostrations required. From the measures of the Chinese to prevent the import of opium resulted the war between China and Great Britain, in 1840; the result of which was the opening of Canton, Amoy, Foo-Chow, Ningpo, and Shanghai to commerce, and the cession of Hong Kong to Great Britain. A second war in 1857, France being allied with Great Britain, ended in the opening of five more treaty ports. A third war (1860) and the march on Peking did even more to open China to the world. After a war in 1884-5 between the United States and Japan, the treaty secured permanent control of Tonkin and Annam.

In 1894 Japan, reviving old claims, drove the Chinese out of Korea, and after victories on land and at sea, captured Port Arthur and Wiaiwai. By the treaty of 1894 Japan secured an indemnity, Formosa and the Liaotung peninsula; but the protests of Russia, Germany, and France made Japan withdraw. Russia then secured a lease of Port Arthur and Talienwan, with railway and other privileges in Manchuria; Germany obtained Kiauchau and concessions in Shantung; and Britain, as an offset, obtained a lease of Weihaiwei and sought to secure trading freedom in the Yangtszeakiang valley. Russia's refusal to evacuate Manchuria and her movements in Korea led to war with Japan in 1903, the defeat of the Russian armies in Manchuria, the destruction of the Russian fleet, and the fall of Port Arthur (1905), China being nominally neutral. By the peace of 1905 Japan secured dominance in Korea, the Russian lease of Port Arthur, and great influence in southern Manchuria and in China generally.

A series of far-reaching reforms, promoted by a national reform party in 1905, were summarily canceled by the dowager empress, who assumed supreme authority; and the reactionary and anti-foreign 'Boxer' association was suppressed in 1901. The 'Twenty-four Harmonies,' encouraged by the court, made extermination of the foreigners its war-cry and besieged the foreign legations in Peking, relieved after a two months' siege by an international force of Japanese, Russian, British, Americans, French and Germans. They remained in occupation for over a twelvemonth. Finally, the peace protocol was signed Sept. 7, 1901, and the dowager returned to her capital. The foreign troops were withdrawn; and Russia in terms of a convention, drafted 1901, unconditionally evacuated, which her troops had occupied, should be gradually evacuated; but the undertaking was not fulfilled.

This breach of faith was a considerable factor in the outbreak of the Russo-Japanese war (1904). Prior to the outbreak of war

China undertook to remain strictly neutral. An Anglo-Chinese labor convention, containing the regulations for the importation of Chinese laborers into the Transvaal, and their control, was signed in 1904, and a treaty similar to those already concluded with Great Britain, the United States, and Japan was made with Portugal in 1904. In 1905, Mr. Hart published his scheme for the reorganization of the financial and military resources of the country. In 1907-8 a number of edicts were issued regarding the extension of self-government in the cities, and a larger degree of civil liberty, and, in August, 1908, a limited constitution was proclaimed.

**Colombia**, formerly New Granada, was discovered by Alonso de Ojeda in 1499; it was visited by Columbus on his fourth voyage, in 1502. The first Spanish settlement was made in 1510 at Santa Maria in the Gulf of Darien, and the whole country was formed into a province under a captain-general in 1547. New Granada was declared the independence of Spain in 1811, and, after eleven years of warfare, succeeded, with the help of Venezuela, in effecting its liberation. Both states were united with Ecuador to form the Spanish domination, to form the first republic of Colombia; but internal dissensions arising, the three states again separated in 1830, and three independent republics, which have had a very troubled existence.

In 1861 the states forming New Granada by agreement adopted a new constitution, the republic being then called the United States of Colombia. This title was retained till, by the new constitution adopted in 1886, the state ceased to be a federal republic and became a unitary republic, the name of Republic of Colombia. The secession of Panama in 1903 was partly brought about by the dilatoriness of the central government in carrying out a treaty arrangement with the United States in regard to the construction of the Panama canal.

**References.**—Scruggs' *The Colombian Republic*; The *United States of Colombia*; Moore's *Constitution of Colombia*.

**Costa Rica** was discovered by Columbus in 1502. Diego de Nicuesa failed in an attempt to colonize it in 1509. The first settlement was made by Francisco Hernandez in 1523, and the country was conquered 1526-65. Independence was declared in 1821, and the territory formed part of the federal republic of Central America from 1823 to 1839. A constitution was promulgated in 1870, and frequently modified since. Between 1870 and 1882 it was under a series of dictators. The president in 1910 was Ricardo Jimenez.

**References.**—Villafraza's *Costa Rica*; Church's *Costa Rica*; Castro's *The Republic of Costa Rica*. **Cuba** was discovered by Christopher Columbus, was discovered in 1492 by Columbus, and first settled by Spaniards at Baracoa in 1511. Havana, founded in 1519, was reduced to a city in 1562, and San Juan de los Rios in 1554. In 1762 the English took and held Havana for a year. In 1818 the trade of Cuba was opened to the world, and for some years the island enjoyed unexampled prosperity. In 1895, when the Spanish empire in Cuba developed its sugar industry. An insurrection against the Spanish authorities went on from 1895 to 1898, a new one broke out in 1898, and the Spanish empire in suppressing it led to the intervention of the United States and the war, disastrous to Spain, of 1898-9. After the war Cuba was occupied by the United States till 1902, when a separate constitution was given to it as an independent republic, closely connected with the United States by a reciprocal commercial convention.

**Denmark.**—The early history of Denmark is lost in the twilight of the saga period, with

its vikings and their valiant deeds. The Danes coming from the islands occupied the lands deserted by the Jutes and Angles who had in the century migrated to England. The Danish monarchy was founded in 936 by Gorm the Old, whose son became a Christian. Waldemar I. (1157-82) ruled Norway also, and conquered Schleswig and Pomerania; under his son Waldemar II, further conquests were made in German and Wendish lands, so that the Baltic became a Danish sea.

By the treaty of Calmar in 1397, Norway, Sweden and Denmark, already under one monarch, Margaret, were formally united into one state. In 1448 the Danes elected as king Christian of Oldenburg, a descendant of their royal family, who was also duke of Schleswig-Holstein; and his line continued on the throne till 1653. Sweden became independent in 1523. Lutheranism was introduced into Denmark in 1537.

In 1515 Denmark had to cede Norway to Sweden; and in 1648 the Germanic peoples of the duchies of Schleswig and Holstein, rebelled against Denmark. For the time the Danes succeeded in retaining the duchies, but the controversy, renewed in 1803, led to the defeat of the Danes by Austria and Prussia (1864), followed by the incorporation of the duchies in the German Confederation, and, after the Austro-Prussian war of 1866, in Prussia.

The most remarkable feature of recent Danish history is the unique parliamentary deadlock originating out of the refusal of the Folkething for nearly twenty years to grant the necessary supplies for fortifying Copenhagen and increasing the national armaments. The Estrup administration, formed for the purpose in 1875, resorted repeatedly to such anomalous expedients as "provisional financial edicts," the majority in the Folkething, who advocated the neutrality of Denmark, retaliated by systematically rejecting every bill laid before them.

Ultimately, however, a large section of the Levee led to abandon to the policy of protest; and in 1893 a new and vigorous political party, which desired parliamentary concord in the agrarian interest, made its influence felt. In April, 1894, the Folkething, for the first time since 1885, not only framed the current budget, but at the same time confirmed nearly all the provisional financial edicts previously issued by the Estrup government.

Since then the principal events of national importance have been a general strike (1900) of 40,000 artisans engaged in the building trades, which paralyzed industry and resulted in the loss to Denmark of \$13,750,000, and the rejection of the proposal (1902) to sell the Danish West Indian islands to the United States.

**Dominican Republic**, or San Domingo, occupies the eastern portion of the island of Hayti. It formerly belonged to Spain and is the oldest colonial settlement in America.

After the discovery of the island in 1492 by Columbus, who named it Hispaniola, it was colonized by the Spaniards, and the larger eastern section remained under Spanish rule until 1844, when independence was gained and the Dominican Republic was formed. Its history during the succeeding twenty-five years is a record of the bitter and often deadly rivalry for the presidency, and of wars with the neighboring republic of Hayti and with Spain.

In 1869 President Baes signed with President Grant a treaty for the annexation of Santo Domingo to the United States. The people of Santo Domingo ratified the treaty, but the United States Senate refused. A revolution in the island republic followed, and in 1886 Gen. Herrez was elected president. In 1899 he was succeeded by President Jimenes, who was defeated by Gen. Vasquez in 1902. There was civil war in 1904 and 1906, and in 1907, a treaty between the Dominican Republic and the United States was ratified, under which the latter will collect the customs revenue, assist the Dominican government to

maintain peace, and act as intermediary between the republic and its foreign creditors.

**References.**—Hazard's *Santo Domingo*; Past and Present; Gladst's *Exposition of Santo Domingo*; Garrison's *The Island of Santo Domingo*.

**Ecuador.**—At the time of the conquest of Peru by the Spaniards Ecuador formed part of the great empire of the Incas. As the presidency of Quito it was long included in the viceroyalty of Peru. From 1710 it became part of the viceroyalty of New Granada (or Santa Fé de Bogotá). In the revolutionary war against Spain, Ecuador, along with the neighboring territories, secured its independence (1822), and was ultimately erected into a separate republic in 1831.

A series of civil wars ensued, lasting almost without intermission for more than twenty years. From 1852 to 1856, desultory hostilities existed with Peru. A war was declared against New Granada, on Nov. 20, 1863, and the Ecuadorian army was routed. In August, 1868, a very destructive earthquake occurred. In 1869, Garcia Moreno, the head of the clerical party, overthrew the government. He was assassinated in 1875 and Dr. Antonio Borrero, the candidate of the non-official party, was elected president. A constitution was adopted and a republic was proclaimed, and until 1884 the republic enjoyed a reasonably peaceful government. In 1884 another constitution was formed, which, with modifications in 1887 and 1897, has since been in force.

**Egypt.**—The early history of Egypt is involved in obscurity. The beginning of the continuous civilization of Egypt dates from about 5000 or 7000 B. C. There is no break of continuity of human works from that age, through every generation to the present time, though the continuous written record does not begin till about 5000 B. C.

Pharaohs of Menes, who formed the old empire of Egypt and founded its capital at Memphis, is variously calculated at from 5004 B. C. to 3992. Egypt was in the height of its glory under the nineteenth dynasty, to which Ramesses I. and II. and Memphis (see of the latter, and probably the Pharaoh of Exodus) belonged. In their time all those wonderful structures were raised, and works perfected, which have been beheld without a parallel. These are the pyramids, the labyrinth, the immense grottoes of the Thebais, the obelisks, temples, and pompous palaces; the lake Mooria, and the vast canals, which served both for trade and to render the land fruitful.

The country continued under the Persian yoke till the time of Alexander the Great, who, having conquered Persia, built the city of Alexandria. He was succeeded by Ptolemy, the son of Lagos, 323 B. C. Ten kings of that name succeeded each other, till Cleopatra, the sister of the last Ptolemy, ascended the throne; then Egypt became a Roman province, and continued so till the reign of Omar, the second caliph of the successors of Mohammed, who drove out the Romans, after which he began to build up the empire, and the power of the caliphs declined. Saladin, in 1171, set up the order of the Mamelukes, who usurped the sovereign power in 1260, and extended their dominions over a great part of Africa, Syria, and Arabia.

At the commencement of the sixteenth century Selim, Turkish emperor, conquered it, and for many years it was distracted by the civil wars between the different sects, and by which its provinces were governed. The famous Hassan Ali, the Turkish admiral, gained several victories over them in 1786; but he was afterwards overthrown and subdued them. The French invaded Egypt in 1798, under Gen. Bonaparte, and evacuated the country in 1802.

In 1817, Mehmet Ali became master of Egypt, and the massacre of the Mamelukes, and under his sway it progressed rapidly in civilization. He considerably extended his boundaries, and by the treaty of London (1841) was recognized as the viceroy of Egypt, and Ottoman empire. The independent position of the rulers of Egypt was much enlarged in 1867, by an imperial firman which established the succession of the descendants of Mehmet

Ali, under the title of khedive, or king. Still greater powers were granted in 1872, and in 1874-5 Ismail Pasha, the then ruler, greatly extended the Egyptian territory, annexing the Sudan to Darfur and finally to the shores of Victoria Nyana.

The finances of the country became so involved that the khedive was placed under European management and the country under British and French control. Ismail in 1879 was forced to abdicate and was succeeded by his son Tewfik. A revolt, under Arabi Pasha, of those opposed to the European influence, succeeded.

It was suppressed by the British army and navy, the French taking no part. In consequence, the dual control ended; and since then Great Britain has been the practical ruler of Egypt, despite the occasional protest of France and other European powers.

About 1880 a serious revolt began in the Sudan, under the leadership of the mahdi, a pretended prophet. Efforts to suppress it proved unavailing; in 1883 an army under Hicks Pasha was totally routed, other officers were defeated, and Khartoum, which was held by Sir Gordon, was taken and the gallant officer killed. By these operations Egypt lost the whole of the Sudan, except the equatorial province, held by Emin Pasha till 1888. In 1898 the British gained a strategic position by the explorer Stanley. In 1892 Tewfik died and was succeeded as khedive by his eldest son, Abbas, the British control continuing. In 1898 an expedition for the conquest of the Sudan, set out under British leadership; Dongola was taken in September and the dervish forces were defeated in several engagements.

The predominant position of Great Britain in Egypt was formally recognized by France under the Anglo-French agreement of 1904.

**References.**—Maspero's *Down of Civilization*; Strabo; Lieut. Gordon, *Persa taken and the Petrie's History of Egypt*; Maspero's *The Phoenician Dynasty*; Milne's *Roman Egypt*; Kock's *Egypt in the Middle Ages*; Maspero's *History of Egyptian Archaeology*.

**England.**—Nothing authentic is known of the history of England before 55 B. C., when the island was invaded by Julius Cæsar, who twice invaded the island, and called it Britain. In 55 and 54 B. C. Claudius resumed the idea of subjugating Britain A. D. 43, and from that time until 83, the Roman armies, making further progress, subdued the interior, as far as the Grampian hills, but the northern portion of the island was never subdued by the invaders.

**The Anglo-Saxon Period.**—In 411 Honorius abandoned Britain, whose inhabitants, finding it impossible to defend themselves against the Picts, called to their aid the Saxons, who (449) assisted them so effectually that they took possession of the country and founded the four kingdoms of Essex, Wessex, Sussex, and Kent. The Angles, who followed them, established three other kingdoms, viz., East Angles, Deira, and Mercia (540-564). All these kingdoms ended by being reduced to one, under Egbert, the Saxon king of Wessex (827).

After 835 the Danes ravaged England from time to time, but in 878 Alfred the Great forced them to depart, and from thence till near the end of his reign (900) the Danes left the island in peace. Returning in 981, the Danes succeeded, in 1013, in putting their king, Sweyn, on the throne, who was not recovered by the Saxon dynasty till 1041.

**Norman Conquest.**—When William of Normandy landed in England to claim the crown which his father, the duke of Normandy, had left to him, he found that the people had raised to the throne Harold, the son of a popular nobleman. The resources of the Saxons, however, had been exhausted, and they were forced to be the attack of William; and the battle of Hastings (1066 A. D.) gave England with comparative ease to the Normans. The next twenty years saw the conquest completed, and nearly all the large landed estates of the Saxons pass, on every pretext except the true one, into the hands of the Normans. In the course of time the Normans were absorbed among the Saxons, their very dialect and laws, and thus through leaving many traces. From this union arose the English people and the English language as they now exist. The union of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

of the Normans with the Saxons was not fully

affected so long as the Normans retained their foreign possessions. At King John's reign the whole of these were lost excepting Guienne and Poitou.

In the reign of Stephen occurred the civil war between the Empress Matilda, daughter of Henry I., and Stephen; she finally retired to France, and concluded a peace with her adversary. The great struggles of the successors of William the Conqueror were with and with the barons. Sometimes in these the popular sympathies were with, and sometimes against, the crown. The Conqueror himself and his immediate successors had no difficulty in maintaining the superiority of the courts of justice over the ecclesiastics; but even a sovereign so bold and skillful as Henry II. was forced, after the murder of Thomas Becket (1170 A. D.) to yield the point. The right to nominate the higher ecclesiastics was also secured by the pope.

**The Plantagenets.**—Under the Plantagenets an era of progress, generally, opened for England. The reign of Henry II. gave to the country the constitution of Clarendon; Ireland was conquered 1171; Edward I. made the most judicious circuits for the better administration of justice, and a digest of the laws was made by Glanville about 1181. Richard I. did little for the internal good of the land, his chief exploits occurring on the field of battle in foreign lands.

**Magna Charta.**—Under John two important events occurred: Magna Charta was obtained, and the French possessions were nearly all lost—both unmitigated blessings; but otherwise John's influence was cast against progress and reform. The degradation of the English monarchy was at its lowest when he consented (1213 A. D.) to hold the crown as a gift from Rome. From Henry II. something similar to the Great Charter had already been granted; but it was the Magna Charta of John which firmly established the great English principles—that no man should suffer arbitrary imprisonment, and that no tax should be imposed without the consent of the council of the nation.

During the reign of Henry III. England obtained her first regular parliament, and gold money was first coined in 1257. Edward I. was crowned 1272. The first year of his reign was the conquest of Wales; Scotland also was subdued, but revolted again in 1297.

The reign of Edward II. was disastrous to himself and to England. The barons rose against his favorites, and Edward was murdered by the connivance of his wife. A new and vigorous era began with the reign of Edward III. The Scots were defeated at Halidon Hill; important victories were gained in France; the Order of the Garter was instituted, and most important of all, law pleadings were ordered to be in English, instead of in the Norman-French tongue, which had hitherto prevailed. Richard II. was crowned 1377, and with his death in 1399 ended the line of the Plantagenets.

The House of Lancaster succeeded in the person of Henry IV. His reign was disturbed by an insurrection of the Welsh under the Percies, but was otherwise peaceful. Henry V. invaded France, won the famous battle of Agincourt, and gained the French crown 1420; but during the reign of his successor, Henry VI., all the French possessions were lost save Calais, which was captured by Warwick the kingmaker, and the first representative of the house of York, Edward IV., was placed on the throne. The wars of the Roses ensued, which continued through the two succeeding reigns of Edward V. and Richard III., ending with the death of Richard on Bosworth field, the coronation of Henry VII., 1485, and his marriage with Elizabeth, daughter of Edward IV.

**The Tudors.**—The union of the houses of York and Lancaster under Henry VII. begins a new period in English history. Henry VIII. succeeded under the motto *Dieu et mon droit*. He found the alliance of his now important country courted by both of his contemporaries, Francis I. and Charles V. But the interest of the foreign complications of the

reign merges in the courts of England and of Rome.

Henry was succeeded by Edward VI. His reign was marked by the general progress which the Reformation made from questions of government to questions of doctrine. The next reign saw the inevitable reaction. The superstitions of the people had been too rudely handled, and, as often happens before a great change comes, a reaction set in, fierce. The conversion of cornfields into sheep-walks, induced by the high value of wool as an article of export, had thrown many out of employment; pestilence, and, moreover, infected with the crowd of vagrants whom the monasteries had been wont to maintain. The popular dissatisfaction coupled these things with the Reformation, and the opportunity was prepared for the atrocities of the reign of Mary.

The accession of the Protestant princess Elizabeth came as a relief to the whole nation. The Romanists themselves were weary of the policy which made England the tool of Spain, and were sickened with the erudites which had been sent. Fortunately for the country, the government of Elizabeth was guided by the able hand of Cecil, was one of peace. The greatest event in her reign was the defeat of the Spanish Armada. On the death of Elizabeth the crowns of England and Scotland were united.

**The Stuarts.**—The reign of James I. does not present much that is remarkable. The plot for which Sir Walter Raleigh suffered long afterward, and the Gunpowder Plot, created a short-lived excitement. Charles I. succeeded to the throne in 1625. The misfortune of Charles I. were the legitimate result of the principles of his father. Charles committed the mistake of repeating in the seventeenth century acts which the Plantagenets and Tudors had done with impunity in the fourteenth and fifteenth. In 1637, when the king found himself involved in a war with Scotland in consequence of his endeavor to alter the liturgy there, he was compelled to call a Parliament. The Commons refused supplies and were again dissolved. In 1640 the king once more summoned a Parliament. His temper of the houses more indomitable than ever.

The Grand Remonstrance (November, 1641) destroyed all chance of a reaction in favor of Charles, and in 1642 war broke out. At first Parliament was worsted, and made an alliance with the Scots. Aided by this alliance, and by the ability of Cromwell and his Ironsides, Charles gave himself up to the Scots, and negotiated with the Parliament. Having been sold to Parliament, Charles was seized by the army, which now stood by itself. Hoping to take advantage of the breach between the Parliament and the army, Charles began intrigues which led to the invasion of England by the Scots on his behalf (the second civil war), and his death in January, 1649, at the hands of Cromwell and his soldiers.

**The Commonwealth.**—The army, now supreme, established a commonwealth, which, under Cromwell, became the Protectorate. Till his death, and after he died 1658, the Commonwealth, though in vain, to govern by means of parliaments. But he was compelled to fall back upon the military force to preserve order, and after he died 1658, the Protectorate of Charles II. became inevitable. In Charles' reign the colonization of New England progressed rapidly.

**The Restoration.**—In 1660, the Stuarts were reestablished, but the errors of James II. brought about a new revolution in 1688, which finally overthrew the Stuart dynasty and gave to the English, as sovereign, William III. of Orange, and as queen, his daughter Mary, daughter of James II. Under Queen Anne, who succeeded him, the union of England and Scotland was consummated, and this union was further illustrated by the victories of Marlborough.

**House of Hanover.**—After the death of Queen Anne (1714), the house of Hanover came to the throne as the nearest heirs of the royal

line, and this family still holds the throne of England. Under this dynasty took place the Seven Years' war (1756 to 1763); the conquest of Canada (1763); the loss of the Anglo-American colonies, now the United States (1776-1783); the French revolution (1789 to 1815); the Irish union (1800); the Russian Revolution (1801); the French and Nonconformist (1820 to 1829); the repeal of the corn laws (1846); the Crimean war against Russia, in concert with France (1854-1856); the Sepoy mutiny, and its prompt repression, in Hindustan (1857-58); and the several expeditions against China (1842 to 1860); the reform bill (1868), and the Fenian and Fenianist (1868-1869) and Abyssinian (1868) wars; the Irish land act (1870); the settlement with the United States of the Alabama claims (1873); the disestablishment of the Irish church; the annexation of the Fiji Islands (1874); the assumption by the queen of the title of empress of India (1876); the Berlin treaty, the acquisition of Cyprus; the fisheries settlements with the United States; the Afghan and Kaffir wars (1878-9); the extension of the franchise (1885), and the Nile expedition (1879).

From 1873 to the present time Irish agitation has been for Great Britain a source of serious disquiet. In 1882 Mr. Gladstone adopted a policy of conciliation, but the murder of Lord Frederick Cavendish and of Mr. Burke caused its abandonment and the immediate passing of a coercion law which virtually placed Ireland under martial law. In 1883 the Egyptian army, under the leadership of Arabi Bey, having revolted from the khedive's authority, Great Britain sent a large naval expedition to Egypt, bombarded Alexandria, and defeated the rebellious forces. Since that date the Egyptian government has been under British suzerainty, and in 1896 a British expedition was sent up the Nile to crush the Mahdists in the provinces of Egypt held by the madist forces.

Within the past quarter of a century Great Britain has largely extended its territory in Africa, bringing great areas in the south and east of the continent under its protection. During the same interval several subjects of dispute have arisen, but the United States, which have all been peacefully settled. An imposing festival took place in London in June, 1897, on the occasion of the sixtieth anniversary of Queen Victoria's accession, the fact that she had reigned longer than any preceding monarch giving the greatest interest and importance to the ceremonies, in which representatives from all sections of the empire took part.

**Boer War.**—October 11, 1899, war was declared by the Boers of the Transvaal and Orange Free State, the aim being the destruction of the British paramountcy in South Africa. This led to the annexation of those states by the British, after a fierce contest, in 1900 and 1902, when the United States elected, which again supported the Conservative ministry, with a slightly increased majority.

**House of Saxe-Coburg.**—Victoria died January 22, 1901, and was succeeded by her eldest son, Edward VII., who proved himself to be an active promotor of peaceful relations with other countries.

The war was concluded in the middle of 1902 by the treaty of Vereeniging, and almost immediately afterward Lord Salisbury retired from office, being succeeded in the premiership by Sir Alfred J. Balfour. The education act of 1902 did away with school boards where they existed, bringing the voluntary and former board schools alike under education committees in England and Wales, and the same change was made in London in 1903. The Irish land act of 1903 was a measure of the first importance, its object being to transfer practically all the agricultural land from the farmers or peasant proprietors. In the autumn of 1903 Mr. Chamberlain resigned office in order to be free to advocate a change in the country's fiscal policy, intended to

unite the colonies more closely with the mother country—a change which many have regarded as meaning a return to protection. Mr. Balfour ended his speech by promising a course in regard to tariff reform, being in favor of preferential tariffs and so-called "retaliation."

In 1904, the introduction of indentured Chinese labor into the Transvaal gold mines aroused much controversy in parliament and the country. The Licensing act of the same year for England and the subsequent fundamental alterations in the tenure of licenses. The question of unemployment having compelled attention, the Balfour ministry passed in 1905 the new unemployment machinery for dealing with distress from this cause. The Aliens act of 1905 should also be mentioned. In foreign affairs the most notable recent events were the Anglo-French agreement of 1904 settling all the outstanding differences between Great Britain and France; and the Anglo-Japanese treaty the following year, extending a similar arrangement of a few years before. The visit of King Edward to Germany in 1906, and of Emperor William to England in the latter part of 1907, did much to secure an amicable understanding between the two powers. The independence of Australia was recognized in 1907.

In April, 1908, Mr. Asquith became premier on the death of Sir H. Campbell-Bannerman. On May 25, 1909, King George V. and Queen Mary were crowned. King Edward was announced, followed by that of his death the next day. His son, George V., succeeded to the throne May 6, 1910.

Europe was probably first peopled from Asia, but at what date we know not. The first authentic history begins in Greece at about 776 B. C. Greek civilization was at its most flourishing period about 430 B. C. After Greece came Rome, which, by the help of the Christian era, had conquered Spain, Greece, Gaul, Helvetia, Germany between the Rhine and the Alps, Illyria, Italy, etc. Improved laws and superior arts of life spread with the Roman empire throughout Europe, and the unity of government was also extremely favorable to the extension of Christianity.

With the decline of the Roman empire a great change in the political constitution of Europe was produced by the universal migration of the northern nations. The Ostrogoths and Lombards settled in Italy; the Franks in France, the Visigoths in Spain, and the Anglo-Saxons in South Britain, reducing the inhabitants to subjection, or becoming incorporated with them. Under Charlemagne (771-814) a great Germanic empire was established, so extensive that the kingdoms of France, Germany, Italy, Burgundy, Lorraine, and Navarre were afterward formed out of it.

About this time the northern and eastern nations of Europe began to exert an influence in the affairs of Europe. The Slaves, or Slavonians, founded kingdoms in Bohemia, Poland, Russia, and the north of Germany; the Magyars appeared in Hungary, and the Bulgarians appeared in Bulgaria. The petty kingdoms and principalities in England, France, Sicily, and the East.

The Crusades and the growth of the Ottoman power are among the principal events which influenced Europe from the twelfth to the fifteenth century. The conquest of Constantinople by the Turks (1453), by driving the learned Greeks from the East, gave a new impulse to letters in western Europe, which was carried onward by the invention of printing, and the Reformation.

The discovery of America was followed by the temporary preponderance of Spain in Europe, and next of France. Subsequently Prussia and Russia gradually increased in territory and strength. The French revolution (1789) and the Napoleonic war had a profound effect on Europe, the dissolution of the old German empire being one of the results.

Since then the most important events in European history have been the establishment of the independence of Greece; the annexation of Poland as a separate state; the unification of Italy under Victor Emmanuel; the Franco-German war, resulting in the consolidation of Germany into an empire (1871).

under the leadership of Prussia; and the partial dismemberment of the Turkish empire.

**France.**—Before the time of Caesar, the whole of France was known to the Romans by the name of Transalpine Gaul; but after its conquest it was divided into the four provinces of *Bretagne* (the Bretons), *Gallia*, *Germania*, *Belgica*. In the fifth century it was subdivided into seventeen provinces, inclusive of all the territory on the east of the Rhine.

At the latter epoch, the Germanic nations began to pour in an irresistible torrent over Gaul; the Visigoths established themselves in the north and south, from the Pyrenees, where they established a kingdom that lasted till about 540. The Burgundians, in a similar manner, settled in the east, from the Lake of Geneva to the Rhine, and afterward stretched along the Rhone to the Mediterranean. The independent sovereignty they erected lasted until about 532.

**Merovingians.**—The Franks, whose dominion swallowed up those of both the foregoing tribes, had been long settled in the north; and Pharamond, their chief in 420, is considered the founder of the French monarchy, as the first of a numerous and powerful race of Frankish kings. In 485 Clovis defeated Syagrius, the Roman general, at Soissons, and finally extinguished the Roman power in the west. In 486, by his victory over the Visigoths, he rendered himself master of all the country between the Loire and the Garonne.

**Division of the Kingdom.**—On the death of Clovis, in 511, his dominions were divided into four kingdoms—those of Paris, Metz, Soissons, and Orleans, each governed by one of his four sons; these, however, were reunited in 558. In 732 Charlemagne defeated the Saracens, who had effected the conquest of a great part of the south of France, and ultimately expelled them from the kingdom.

**Carolingians.**—Under Pepin and Charlemagne the country was relatively peaceful and prosperous; but after the latter's death and the return to their original state of anarchy. Under his immediate successor France was again divided into four parts, and the Normans began to ravage its northern provinces; the power of the nobility also gradually increased; and the last sovereign of the Carolingian dynasty, Louis V., in 986-7, possessed only the town of Laon.

**Capetians.**—His successor, Hugh Capet, count of Paris and Orleans, the founder of the third race of kings, the Capetians, governed only the Ile-de-France, Picardy, and the Orleansais; the dukes of Normandy, Brittany, Aquitaine, Gascony, Lorraine, and Burgundy, the counts of Flanders, Champagne, Vermandois, Toulouse, and several minor seignories, shared among them the rest of the modern kingdom. By degrees, however, all the great fiefs fell in various ways to the crown. Vermandois was united to it by Philip Augustus; Toulouse and Provence, by Louis IX.; Champagne, in 1274; the Lyonnais, Dauphiny, and Languedoc, in the fourteenth century; Berry, Normandy, Gascony, Burgundy, Aquitaine, Maine, and Provence, in the fifteenth; Bourbonnais, Auvergne, Brittany, Lorraine, and considerable territories in the southwest in the sixteenth and seventeenth centuries; the French Comté, and Alsace in the seventeenth century.

**Under the Bourbons.**—While the monarchy gained in consistency and extent, the royal power was making constant advances, the political rights and privileges which the nobles exercised under the feudal system were the objects of continual attacks on the parts of the crown, which, though sometimes defeated, were in most instances successful. At length, under the administration of Richelieu, the nobles were stripped of all power; and there being no other body in the state, with the exception of the clergy, which had degenerated into little else than courts of law—that enjoyed any constitutional privilege, the power of the crown was raised to the highest point of control.

Under the vigorous, and for a lengthened period prosperous, government of Louis XIV.,

the royal prerogative arrived at a maximum. But the close of this reign was eminently unprosperous; and the wars in which Louis had been long engaged, the darkest of which he had imposed on his subjects, and the vast debts he had contracted, produced not only great suffering and misery, but also great discontent.

During the regency and the subsequent part of the reign of Louis XV., abuses of all sorts multiplied on all hands, and were no longer controlled by the darkest of which he had imposed on his subjects, and the vast debts he had contracted, produced not only great suffering and misery, but also great discontent. The abuses that infected the whole frame of society, though destructive of the public interests, were either really advantageous, or believed to be so, to a numerous and powerful class, including the nobility and clergy; and it would have required a mind of a very different order from that of Louis to have frustrated the solicitations, intrigues, and cabals of such powerful parties, and to have safely carried through the reforms that had become indispensable.

**French Revolution.**—At length after a variety of futile expedients had been in vain resorted to, it was resolved, in 1789, to hold a meeting of the States-General, which had not been convened since 1614, for the purpose of necessary changes, and averting a public bankruptcy.

This was the commencement of that tremendous revolution, which cost Louis XV. the crown and his life, and destroyed every vestige of the government and institutions that existed when it broke out. The atrocities committed with respect to the human wild, but not unnatural excesses of an uneducated populace, that had suddenly been emancipated from a state of extreme degradation. The prevailing proscription and anarchy by which the revolution was accompanied continued till Napoleon attained to the supreme direction of affairs. The talents of this extraordinary man were surpassed only by his ambition, which, by overstepping all bounds, precipitated him into enterprises that ultimately led to his overthrow.

**Bourbons Restored.**—In 1814, the Bourbons were restored to the throne, but the elder branch had profited as little as the Stuarts in England under similar circumstances, by the lessons of adversity, and in 1830 they were expelled from the kingdom. The crown was then offered, under certain conditions, to Louis Philippe, Duke of Orleans, by whom it was accepted. He has the credit of having preserved the country, in difficult circumstances, to maintain, for a lengthened period, the peace of France and Europe. But he alienated the public by his plan of having the king to be a private citizen, and by the corruption which pervaded every department of his government.

**Second Republic.**—This led to the revolution of Feb. 24, 1848, and the establishment of the republic, which prevailed over a provisional government. A new constitution having been voted by a "Constituent Assembly" of nine hundred members, Prince Louis Napoleon was elected president of the republic for four years, by 5,562,543 votes, on the 10th of December, 1848. The prince-president dissolved the National Assembly by a coup d'état, and proceeded to remodel the constitution, appealed to universal suffrage, which declared him president for ten years, by 7,439,216 votes, on the 21st of December, 1852.

**Empire Restored.**—By a third vote, Louis Napoleon was chosen Emperor of France, by 7,664,216 against 231,145 votes, on the 2nd of November, 1852. He was crowned Napoleon III., Emperor of the French, on the 1st of December, 1852. The Crimean war

(1854-55) and the war against Austria on behalf of Italy (1859) distinguished the early part of his reign. The latter greatly aided in the foundation of a united Italy, and gave France the territories of Savoy and Nice (1860).

**Franco-Prussian War.**—In 1870 the uneasiness of Napoleon and the French at the steady aggrandizement of Prussia broke out into flame at the offer of the Spanish crown to a prince of the house of Hohenzollern. France, not satisfied with the renunciation of the German prince, demanded a guaranty from the king of Prussia that the candidature should never be resumed. This being refused, France declared war. One French army was driven back by the Prussians, who moved up in Metz, another was pushed northward to Sedan, and so hemmed in that it had to surrender with the emperor at its head.

**Third Republic.**—On the news of this disaster reaching Paris the republic was proclaimed. After an almost uninterrupted series of victories the Germans became masters of the French capital (January 28, 1871), and the war ended in France. The German army occupied Alsace and a part of Lorraine, and paying a war indemnity of five milliards of francs (\$1,000,000,000). Meanwhile civil war had broken out in Paris, which was suppressed with great difficulty. The assembly elected in 1871 for the ratification of peace with Germany found it expedient to continue their functions. Thiers remained at the administration. In 1873 the Thiers administration was overthrown and replaced by one under Marshal MacMahon. In 1875 a republican constitution was adopted. In 1879 MacMahon resigned his presidency before its legal expiry, being succeeded by Jules Grévy, who has been followed by Carnot (successor of Thiers), Sadi Carnot, and Loubet. In 1881 France occupied Tunis as a protectorate; in 1883-4 she extended her influence over Tonkin and Annam; in 1895 she reduced Madagascar to a colony. The alliance with Russia (1895) was followed in 1905 by the *entente cordiale* with Britain; and 1905 saw the disestablishment of the Roman Catholicism in Belgium.

**Germany.**—When first, in the fourth century B.C., the Romans heard of new peoples of common kin, whom they called Germans, the German tribes were living between the Elbe and Rhine and to the north of the Main. In 88 B. C. Caesar drove back the Germans who had crossed the Rhine. Successful Roman incursions were made into Germany under Augustus; but in 6 A. D. the German tribes rose under Arminius (Hermann) and utterly destroyed Varus and his legions.

Henceforth the Romans were in the main content to hold a strip of territory from the lower Rhine to the upper Danube, and to guard the frontiers of the empire against German raids. From the third century on this became impossible, and in the fourth, the Germans continued to force their way into Roman territory. By the end of the fifth century they had overrun Gaul, Italy, Spain, and part of Africa. After this Germany itself continued to be a divided state, till it came under the single rule of Charlemagne.

**Empire of Charlemagne.**—The history of the German empire properly commences with the treaty of Verdun (843), which separated the land of the eastern Franks under Ludwig the German from that of the western and central Franks. Out of Ludwig's kingdom was to spring a divided state, nationality. Charles the Fat became emperor in 881, and three years later was also elected king of the west Franks, thus again uniting under one scepter the monarchy of Charlemagne.

After his deposition in 887 the two territories of the eastern and western Franks were again separated, the former electing Arnulf as king. He died in 899, and

was succeeded by his infant son Louis, who was proclaimed king of Lorraine in 900, assumed the title of emperor in 908, and in 911, he designated Louis IV. He died in 911, and the German emperor Conrad, count or duke of Franconia, as his successor. He died in December, 918, of a wound received in battle with the Huns. In 919 Henry the Fowler, duke of Saxony, was elected.

**Holy Roman Empire.**—Henry was succeeded by his son Otto the Great in 936, who revived the title of Charlemagne, received the crown of Holy Roman empire from the pope in 962. He died in 973, and was succeeded by his son Otto II, who had been crowned emperor by the pope in his father's lifetime. Henry II, duke of Bavaria, assumed the Saint, the hereditary heir of the Saxon line, was elected at Mainz, on the death of Otto in 1024, crowned emperor in Rome 1014, and died in 1024. With him ended the Saxon line of emperors.

Conrad II, surnamed the Salic, a Franco-German nobleman, was chosen to succeed him. He spent several years in Italian wars, defeated the Poles, and restored Lusatia to the empire. He died in 1039. He was succeeded by his son Henry III, who had been chosen in his lifetime, and who, the imperial power being now at its highest point, exercised more despotic authority in Germany than any predecessor.

The fruits of his policy were lost by his son Henry IV. (1056-1106), who was passionate and weak. In his reign occurred the famous quarrel of the pope regarding the investiture, which ended in Henry having to humble himself before the pope at Canossa. His life was embittered by contests against rival emperors, and ended by the deposition of his own son Henry to the papal party, by whom he was eventually deposed. Henry V. (1106-25) inherited, however, the quarrel of the investitures, took Pope Paschal II. prisoner, and was excommunicated by several councils. At length the question of investiture was settled by the Concordat of Worms (1122). On his death there was a contested election, and a civil war between Lothair, duke of Saxony, and Conrad of Hohenstaufen, in which the former was successful.

A contest was now begun between the Saxon (Hohenstaufen) and Guelph (Guelph) families, in which the celebrated party names Guelph and Ghibelline originated. On the death of Lothair in 1138 Conrad III. (of Hohenstaufen) was chosen to succeed him. Conrad died in 1152, and was succeeded by his nephew Frederick Barbarossa. His son, Henry VI., began his reign with a war in southern Italy. He conquered Sicily, and was crowned king of it in 1194. He died at Messina in 1197. Philip, brother of Henry, and Otto IV., were elected by rival factions in 1198. On Conrad IV.'s death commenced the long interregnum from 1254 to 1273, which ended in delivering Germany from anarchy.

**House of Hapsburg.**—In 1273 Rudolf I., the first of the Hapsburg line, which still reigns in Austria, began his reign and ended it by destroying the strongholds of the nobles. For the next 200 years, counting from 1292, the period of the accession of Adolfus, the history of the German empire presents few features of interest. In 1493 Maximilian I. succeeded his father, Frederick III., married Mary, daughter of Charles the Bold of Burgundy. He began his reign as the prince of the general politics of Europe, while his opposition to the reformed faith preached by Luther embittered the religious differences between the close of the fifteenth century.

**Charles V.**—Maximilian I. was succeeded by Charles V., the fourteenth sovereign of the house of Austria in 1515, and gloriously resuscitated the grandeur of the empire. Although opposed to Luther, he began his reign as the prince of Germany to settle their religious differences among themselves, and to quell the insurrection of the peasants in 1525, which threatened to overthrow his throne. He abandoned in favor of his brother Ferdinand in 1556, who granted entire toleration to the Protestants.

**Thirty Years' War.**—Ferdinand's reign was marked by domestic and foreign wars, and anarchy, both civil and religious, now ob-

stained in his dominions to such an extent as to culminate in the Thirty Years' war, which closed under Ferdinand III. by the treaty of Westphalia, 1648. This terrible war depopulated the rural districts of Germany, destroyed its commerce, crippled the powers of the emperors, burdened the people with taxes, and cut up the empire into a multitude of petty states; whose rulers exercised almost absolute power.

The reigns of Leopold I., Joseph I., and Charles VI. were occupied with long wars with Russia, Prussia, and Saxony. The death of Charles, in 1740, gave rise to the war of the Austrian succession, which secured the throne to the husband of Maria Theresa, Charles's daughter, and thus placed on the throne a member of the House of Lorraine, in the person of Francis I. Thus the house of Hapsburg-Lorraine, which had succeeded to the hereditary possessions of Austria, was recognized as the head of the empire. After a brief interval took place the Seven Years' war (1756-63), in which Austria, Russia, France, and Saxony combined against Prussia, then ruled by Frederick the Great. The peace of Hubertburg (1763) concluded the war, Prussia retaining her acquisitions.

In 1765 Joseph II. succeeded to the imperial throne. He took the command of his army, co-regent with his mother of the Austrian hereditary dominions. He joined with Russia and Prussia in the first partition of Poland in 1772. His brother, Leopold, who, having died in 1792, was succeeded by his son, Francis II., who joined in 1793 in the second partition of Poland, and took the command of his army against the French in 1794, concluded the peace of Campo Formio with Bonaparte (1797); joined the second coalition against France in 1799. His son, Francis II., who died in 1806, joined the third coalition in 1805, and concluded the treaty of Presburg (1805). In 1804 Francis took the title of emperor of Austria, and thus, after twenty-two years later that of head of the German Empire, which, indeed, had ceased to exist, owing to the conquests of Napoleon.

**Confederation of the Rhine.**—The states of Germany were united by the Treaty of Vienna (1815), in a confederation called the German Confederation (*der Deutsche Bund*). In 1818 a general commercial league, called the Zollverein, was formed by Prussia, and was gradually joined by most of the German states, exclusive of Austria. Revolutionary outbreaks caused great disturbances in various German states in 1830 and 1848, particularly the latter. The German diet was restored in 1851 by the efforts of Prussia and Austria, who were latterly rivals for the supremacy in the confederation.

In 1866 the majority of the diet supported Austria in her dispute with Prussia respecting the disposal of the duchies of Schleswig and Holstein, whereupon Prussia withdrew from the confederation, and declared war. The Seven Weeks' war between Austria and Prussia ended in the defeat of the former, the loss of her Italian possessions, and her exclusion from the German Confederation, which was reformed by Prussia and Austria, the title of the North German Confederation.

**The Present Empire.**—After the Franco-German war in which the South German states, as well as the North German Confederation, supported Prussia, the king of Prussia proclaimed German emperor (William I.) at Versailles on January 18, 1871. The parliament of the empire soon met at Berlin, and adopted the new constitution. William I. was succeeded by his son Frederick, and grandson, William II., in 1888. The war gave Alsace-Lorraine to Germany, which since then has acquired large areas in southwestern and eastern Africa, with a portion of New Guinea, the chief Samoan islands, etc. In recent years the empire soon met at Berlin greatly developed, and the Emperor William II. is bent on making Germany a great naval power.

**Greece.**—Before the dawn of history, we have traces of the encroachments on one another by various Hellenic or Greek races, tribes, or alliances—Pelægiæns, Ætolians, Ionians, Boeotians, and Achæians being among them.

**Ancient Greece.** The first thing striking you when you visit Greece is the fact that the historical fact is the invasion from the northward by the Dorians, who made themselves masters of the Peloponnese about the beginning of the twelfth century B. C. A consequence of this Dorian invasion was the colonisation of the islands and of the coasts of Asia Minor by Eolians, Ionians, and later by Dorians also. The seeds of that literature, art, and philosophy which afterward made Greece, and especially Athens, glorious were sown and first nurtured in the colonies.

By degrees Greek colonies established themselves on the shores of the Black Sea, and along both north and south coasts of the Mediterranean, Sicily was largely Hellenized, and South Italy became Magna Græcia.

Neither at home nor abroad had the Greeks the faculty of union as a nation or race; even in the fatherland there were multitudes of small states, a city with three or four miles of territory being often an independent state of itself, and frequently at war with its neighbors. Almost the only central bond of union, besides the Hellenic tongue in its various dialects, was the oracle of Apollo at Delphi.

**Sparta and Athens.**—For long, two Greek states were preëminent. The powerful Dorian state of Sparta was recognized about 800 B. C. by Lycurgus, the kingly institution being re-

Lycurgus, the stingy measurer being retained. Athens was democratic before that date, and its constitution, fixed by Solon in 594 B. C., ultimately triumphed over the tyranny of Pisistratus and his sons. The crachments of the Persians on the Greek colonies of Asia Minor led to the invasion of Greece by the Persians in 490 B. C., an invasion gloriously repelled by the Athenians at Marathon. Xerxes was defeated at Thermopylae, Salamis (480), Plataea, and Mycale. Athenians and Spartans for a time combining their forces.

Now it was that Greek literature and Greek art attained a perfection that has made the rest of the world ever since scholars and imitators of the Greeks of the Periclean period.

The next period is marked by the fratricidal struggle between Athens and Sparta in the Peloponnesian war, which ended in the humiliation of Athens in 404 B. C., and the

**Macedonian Rule.**—In 379-1 the Thebans asserted themselves vigorously against the Spartans; and forty years later Philip of Macedonia subjected Greece to a semibarbarous nation. Under his son, Alexander the Great, the Greek name and the Greek fame were extended into Asia and Africa by the Macedonian king's campaigns.

**Conquest by Rome.**—In 197 the Romans broke the Macedonian power, and by 146 were masters of Greece, which subsequently shared the fortunes of the Roman empire. When the Roman empire was divided (395 A. D.) into the eastern and western empires, Greek was of course the language of the Eastern, Greek, or Byzantine half of the Roman dominion. The Hysazantine emperors fell in 1453 before the Turks, under whom the Greek race reached the lowest stage of political, intellectual, and spiritual and spiritual decadence, though the Greek church survived, and the old Greek tongue, in corrupted guise, continued to be spoken.

**Modern Greece.**—From 1715 till 1821 the Greeks were without intermission subject to the domination of the Turks. A national re-awakening began in 1821; and by 1828, with the support of Britain, France, and Russia, Greece was again a free, but small and weak kingdom. The Russo-Turkish war of 1877-8 added Thessaly and part of Epirus to its area; but the ambition of the Greeks to secure a large share of the "sick man's" inheritance—especially Macedonia and Constantinople—is one of the causes that has led to growing embarrassment in the national finances, and to the national bankruptcy in 1893.

In 1897 an insurrection in Crete led to the interference of the Greeks and to war with Turkey, the result being the speedy defeat of Greece, entailing the payment of a heavy war indemnity, with some loss of territory on the Thessalian frontier.

**Guatemala.**—A republic of Central America, discovered by Columbus in 1502. A large part of it was conquered by the Spaniards about 1524, and erected into a captain-generalship by the Emperor Charles V. in 1527.

Guatemala, together with the other states of Central America, became independent in 1821. A confederation, which existed from 1824 to 1839, was overthrown by an uneducated but able Indian named Carrera, who founded the present republic and governed it until his death in 1865. General Barrios was president from 1871 to 1885, and under his iron rule the country made much progress. In 1897 Guatemala became a member of a new confederation called the Greater Republic of

**References.**—Brigham's *Guatemala, the Land of the Quetzal*; Niederlein's *The Republic of Guatemala*; Madley's *A Glimpse of Guatemala*.

**Hayti** was discovered by Columbus in 1492. It was then inhabited by perhaps 2,000,000 natives, but so ruthlessly did the Spaniards deal with the aborigines that within a century they practically exterminated them, having introduced negro slaves in their place. In 1630 the French settled in the western part of the island, and in 1697 the western portion was ceded to them, while the eastern remained Spanish.

1791 the negroes revolted against France, and latterly the whole island came under the negro leader Toussaint L'Ouverture, who established an independent republic. He was captured, but in 1803 Desmalines headed a new insurrection, drove out the French, and the emperor Napoleon bought the island. He was reinstated in 1806, but Spain regained the eastern portion of the island. In 1821 the Spanish portion declared itself independent of the mother country, and assumed the name of Spanish Hayti; but it was subjugated by Boyer, the president of the

In 1844 the inhabitants of the Spanish portion rose, and formed themselves into a republic under the name of San Domingo (*República Dominicana*). In 1861 Santana negotiated a reunion of the state with Spain, but Spain evacuated the island in 1865. From that period its history has presented an almost uninterrupted scene of revolution and bloodshed. It now comprises the republic of Hayti on the west side of the island, and the Dominican republic on the east.

**Honduras**, a republican state of Central America, on the Gulf of Honduras, was discovered by Columbus in 1502, and conquered by one of Cortes' associates in 1523. It joined the republic of Central American states in 1821, and became an independent state in 1838. The present constitution was adopted in 1860. The president, Gen. Santos-Guardiola, was assassinated at Comayagua by Pablo Aguirre, commander of his bodyguard, 1862. Honduras united with El Salvador and Guatemala to elect President Carrera, 1893. Owing to military reverses, President Montes was compelled to take flight, July 26, when José María Medina was provisionally elected in his stead. The President Medina was re-elected in 1899 for a term of four years. He was subsequently shot by his successor, M. A. Soto, was elected in 1870. Policarpo Bonilla was elected president in 1876. Honduras is a member of the League of the Greater Republic of Central America.

**India.**—The early history of India is obscurely written in the myths of Sanskrit literature.

but the first fact of any certainty is that about the year 2000 B. C., or even earlier, an Aryan people of comparatively high civilization descended from the mountain regions of the northwest into the plains of India and subdued the original inhabitants there.

The expedition of Alexander the Great to the Indus in B. C. 326 gives us a momentary glimpse of that part of India; but between his invasion and the Mohammedan conquest there is little authentic political history of India. In the third century B. C., Buddhism was established throughout India, but it afterward entirely gave way to Islamism. The first six centuries of the Christian era were occupied by struggles between the native dynasties and invaders from the northwest.

**Mohammedan Conquest.**—In the eighth century the tide of Mohammedan influence began with Kasim's advance into Sind (711 A. D.). But the Mohammedans were again driven out in 828, and for more than one hundred and fifty years afterward the strong feudal and tribal organisations of the northern Hindu kingdoms were a barrier to the Mussulma advance. At length, in the year 1001, Mahmud of Ghazni reduced the Punjab to a province of Central Asia, and the Mohammedan power was firmly established in the Punjab and India. In 1398 Timur, or Tamerlane, defeated the sultan (or Mongol) invasion of India, and after sacking Delhi retired into Central Asia.

**the Moguls.**—In 1526 Sultan Baber, a descendant of Tamerlane, founded the Mogul empire in India. His grandson Akbar reigned from 1556 to 1607, and extended his power over most of the peninsula, being distinguished by his justice and his tolerance in matters of religion. He sent a magnificent embassy to the ambassador from James I. in 1615. During the reign of his successor, Shah Jehan, famous for his architectural magnificence, the Marathas began to be formidable in Southern India. In 1674, the Marathas, led by their youngest son Aurengzeb, who made war successfully with the Afghans, the Rajputana tribes, and the rising power of the Marathas. The Sikhs, a Hindu sect, formed a religious and military empire in the Punjab in 1675. On the death of Aurengzeb in 1707 the Mogul empire began to decline, Mohammedan viceroys like the Nizam and the ruler of Oudh asserting their independence, while the great Hindu empires of the Sikhs, the Marathas, and the Marathas began to harass the decaying empire.

**European Colonization.**—The Dutch, Portuguese, and French, as well as the British, established themselves in the empire; in the eighteenth century the French more than rivaled the British in the number of colonies. The British East India company, originally traders, became dominant after the battle of Plassey in 1757. Gradually English power as represented by the company, its diplomats, and its army, came to predominate in all parts of India, and the governors—Clive, Warren, Hastings, Wellesley, Amherst, Bentinck, Dalhousie, Canning—consolidated what was really the empire of Britain in the east. Then in 1857 came the great Sepoy mutiny, which was crushed in blood, and not brought to an end until May, 1858.

**British Colony.**—In 1858 the direct sovereignty of India, and the powers of government hitherto vested in the East India Company, were vested in the British crown. Lord Dalhousie, who had been in India since 1848, was appointed to England early in 1869, and was succeeded by Sir John Lawrence, who died in 1863. Sir John (afterward Lord) Lawrence was governor-general from 1863 to 1868, when he was succeeded by the earl of Mayo, who did much to develop the resources of India, and to remove the restrictions upon trade between the different provinces, and constructing roads, canals, and railways. He was assassinated by a Mohammedan fanatical the Andaman Islands, and was succeeded by the earl of Mayo in 1872. During his administration a famine in lower Bengal (1874), the dethronement of the Gaekwar of Baroda for disloyalty (1875), and the tour of the Prince of Wales through India (1876), were the chief events.

tion of peace signed in 1904 by the most powerful chiefs may lead to their cessation. At the beginning of 1911 negotiations were in progress with the United States for the adjustment of the Liberte public debt, similar to that in force in Santo Domingo.

**References.**—Durham's *The Low Sea of Luzon*; Johnston's *History of the United States*; Liberte's *Liberte* (Washington, 1910).  
**Luxemburg, Grand Duchy of**, a small independent state of western Europe, was ceded to Belgium by the monarch of France, and created a county in 965. In the twelfth century it came into the possession of the counts of Limburg, who took the title of counts of Luxemburg. The Emperor Charles IV. erected it into a duchy in 1354. It came to Philip of Burgundy by his marriage with Isabella, daughter of the king of Portugal, in 1443, and through him passed to the house of Spain, with whom it remained until the peace of the Pyrenees, when part of it was ceded to France November 7, 1659. It was ceded to France by the treaty of Campo Formio, October 17, 1797, and it passed to Holland in exchange for certain German principalities in 1814, and became a grand duchy.

In consequence of the Belgian revolution, Luxemburg was dismembered, and a portion was assigned to Belgium by the conference of London, 1831, and the fresh claims were made in 1839, the king of Holland retaining the title of grand duke of Luxemburg. The grand dukes belong to the Dutch royal family, and the state is governed according to its own constitution. In the treaty of London (1867) it was declared to be neutral territory.

**References.**—Baudouin's *Grand Duchy of Luxemburg*; Coster's *History of Luxemburg*; Farnmore's *In Further Ardennes*.

**Mexico.**—The oldest inhabitants, the Toltecs, by the eighth or ninth century A. D. attained a comparatively high civilization. About the eleventh or twelfth century the kindred but fiercer Aztecs became dominant, and erected on the ruins of the Toltecs a gloomy religious beliefs and bloody rites. Cortes and his Spaniards landed at Vera Cruz in 1519; and the conquest of the empire was creditable to the superiority of the Europeans as it was dishonorable to their humanity. Mexico was long the richest province of Spanish America, and was systematically and mercilessly exploited for the benefit of Spain.

Discontent on the part of the inhabitants, Spanish as well as of mixed blood, broke into open rebellion in 1810, and the capital was surrendered by the last of the viceroys in 1821. Turbide proclaimed himself emperor next year; and after various convulsions and rebellions the federal republic was established in 1823. For the next fifty years the history of Mexico is a mere record of chronic disorder and civil war.

In 1845 Texas was incorporated with the United States; and after the war of 1848, Mexico ceded half a million square miles to the United States. The emperor Napoleon III. declared war against the president, Juarez, in 1862; the Austrian emperor, Maximilian, imposed by the French, was executed in 1867, and the republic reestablished. Under President Diaz, who has been continuously at the head of the government since 1876, the whole energy of the government has been given to the development of railways, mines, and other industries.

**Monaco**, a city and principality on the Mediterranean, surrounded on all three sides by the French dependency of Alpes-Maritimes, nine miles from Nice, under the protection of France. The city is built on a rocky promontory stretching into the sea. The principality of Monaco passed into the hands of the Genoese house of Grimaldi, about 908. The male branch of the Grimaldi becoming extinct in 1731, the state passed by marriage to the house of Matisson, which assumed the name

of the original family. Mentone and Rocca-bruna having been sold to France in 1661, the principality is now confined to the city of Monaco and the town of Monte Carlo. In 1699, the reigning prince, Charles II., abolished all taxes, his revenue being confined to the rent of the casino, which became notorious as a gambling establishment. He was succeeded by the present prince, Albert, in 1818, who granted a representative government in 1911.

**References.**—Métivier's *Monaco and Its Princes*; Pickering's *Monaco*; Tassie's *Monaco*.

**Montenegro** first appeared as a principality under the name of Zeta in the fourteenth century, and was subject to the great Serbian kingdom till about 1389. In 1510 the present prince abdicated in favor of the Archbishop Vasil, who then formed Montenegro into a theocratic state, under an autocratic vladika or ecclesiastical prince-bishop. The dignity was inherited through brothers and nephews, and after 1697 became hereditary in the family of Petrovitch Njegos. The history of Montenegro for many years is a record of deadly struggles with the Turks, and of a slowly growing civilization among its inhabitants. In 1852 Danilo I. became vladika, but in 1855 he carried, under his ecclesiastical character, the name of the title of border or prince, and transformed his land into a secular principality, the independence of which was soon recognized by Russia. Danilo was assassinated in 1860, and in the present prince, Nicholas I. Petrovitch, became hereditary. In 1861-2 he engaged in a not altogether successful war against Turkey; but in 1876 he joined Serbia and in 1878-9 Russia against his hereditary foe, with the result that 1900 square miles were added to his territory by the treaty of Berlin. In 1909 Montenegro gained complete sovereignty in national affairs.

**Morocco** in ancient times formed part of the Phoenician and about 45 B. C. was incorporated in the Roman empire. In the latter part of the seventh century the Arabs spread over North Africa, and took possession of Morocco. Among ruling dynasties since then have been the Almoravids, Almohads, and others. The present dynasty, the ninth, was founded in 1648. In 1814 the slavery of Morocco was abolished and piracy was prohibited in 1817. In 1859-60 there was war with Spain, resulting in a small cession of land and an indemnity to Spain. The conquest of Algeria brought France into troublesome connection with Morocco, and Germany latterly intervened and brought about a European conference in 1906, which instructed France with certain powers. In 1909 the rights of both Germany and France were defined in an additional treaty.

**Nepal** is a name kingdom of India, on the southern slope of the Himalayas, between Tibet and Bengal, was formerly divided between numerous independent chiefs, until it was united by the Ghoriks in 1768. The aggressions of the latter into the Chinese territory was put a stop to in 1792, and the rajah obliged to make an ignominious peace. The next twenty years were against the British, who, after a two years' war, obliged them, in 1816, to cede all the country between the Sutley and the Kali rivers, and to evacuate the territory of Sikkim. They rendered material assistance to the British in the mutiny of 1857. The present sovereign, Shamsher Jung, acceded in 1881.

**Netherlands, Kingdom of**, the known generally as Holland, has been an independent state since 1815.

**Early History.**—The ancient inhabitants of the country, the Frisians and the Batavians, became subjects or allies of the Romans in the

first century A. D., and so remained till in the fourth century their territories were overrun by the Saxons and Salian Franks. At the end of the eighth century the Low Countries submitted to Charles the Great, and the feudal dukedoms, counties, and lordships were gradually established (the countship of Holland in the eleventh century). In 1384 the earldom of Friesland passed to the Netherlands, Burgundy, and Philip the Good (d. 1450) made the Low Countries as prosperous as any part of his Burgundian state.

**Dutch Republic.**—Charles V. inherited the Burgundian dominions; and under his son, Philip II. of Spain, broke out the bitter quarrel between Holland and Spain, between Dutch Protestantism and persecutions and Spanish tyranny and persecution, which ended in 1581 in the establishment of the Dutch republic as an independent state under William the Silent (of Orange), though the war continued with intervals till 1648, and the Belgian provinces abode by their allegiance to the kings of Spain. In the seventeenth century Dutch commerce, especially at sea, Dutch science, Dutch classical scholarship, Dutch literature and Dutch art attained an eminence hardly afterward equalled.

Under William III. of Orange the rivalry of Holland and England at sea led to the unfortunate wars of 1652-4 and 1664-7. The accession of William III. of Orange to the stadtholdership of the united provinces (1672) proved the salvation of the republic from France; in 1678 Louis XIV. signed the peace of Nimegue. Ten years later William was again the savior of English liberties, and became king of Great Britain and Ireland. On William's death, the united provinces became a pure republic once more; the hereditary stadtholdership was reestablished in 1747; and when French revolutionaries and French armies overran Holland, the Stadholder William V. fled to England, and the united provinces became the Batavian republic.

**Napoleon.**—In 1806 Louis Bonaparte was made king of Holland by Napoleon; and on the fall of Napoleon, the northern, or Dutch (and mainly French) provinces were united with the southern, or Belgian (and purely Catholic), provinces into the ill-assorted kingdom of the Netherlands, under the prince of Orange, in 1815.

**Modern Kingdom.**—In consequence of the Congress of Vienna, William V. was proclaimed king of the Netherlands, as William I. in March, 1815, and recognized as an independent sovereign by all the powers of Europe. Belgium seceded in 1830, and Holland fully recognized the independence of the Belgian kingdom in 1839. King William I. abdicated in 1840. William II., his son, granted a new and more parliamentary constitution in 1848, the upper house being elected by the provincial councils, the lower directly, but by a comparatively limited electorate.

During the reigns of William III. (1840-90) and his daughter Wilhelmina, the present queen, the chief political problems have been (1) colonial, (2) financial, and (3) social reforms. (1) A system of forced native labor, revived and extended by the governor of Java in 1830, and professed but oppressive, was suppressed after a prolonged struggle in 1870. Slavery in the American colonies was abolished in 1843. In 1872 the colonies in Guinea were ceded to Great Britain, the Dutch in returning being awarded free land in Sumatra. (2) The strain of these wars and the example of other countries, led to a protectionist movement, which was checked at the general election of 1905. A income tax was established in 1902. (3) A bitter conflict over denominational versus secular education lasted from 1857 to 1900.

**Nicaragua**, a republic of Central America, between the Gulf of Fonseca and the Gulf of Amula, and conquered by Pedro Arias D. Avila, the governor of Panama, in 1522. During the great year of revolution in Central America, 1821, it threw off its allegiance to Spain, and, after a severe and desperate

struggle, gained its independence, and became the second state in the Federal republic of Central America.

On the dissolution of that union, in 1839, Nicaragua became an independent republic, but, like most of the Central and South American republics, it has been the scene of much discord and confusion. The dispute with England concerning the Mosquito territory (1847-58), was settled in favor of Nicaragua; but subsequently, in 1855, the leaders of the opposing parties of Liberals and Conservatives plunged the country into civil war, which ended in the total defeat of the former. In 1897 it joined with its neighboring republics to form the Greater Republic of Central America.

**References.**—Niederslein's *State of Nicaragua*.

**Norway.**—In the earliest times, Norway was divided among petty kings or chiefs (jarls), and its people were notorious for their practical habits. Harold Fair-hair (who ruled from 863 to 933) succeeded in bringing the whole country under his sway, and was succeeded by his son Erick, the saint, who was driven from the throne, which was seized in 938 by his brother, Hak I., who had embraced Christianity in England.

Magnus the Good, the son of St. Olaf and Alfhild, an English lady of noble birth, was called to the throne in 1036; and having in 1042 succeeded also to the throne of Denmark, united both under one monarchy. After his death, the crowns of Norway and Denmark again passed to different individuals. In 1319 the crowns of Norway and Sweden became for a short time united in the person of Magnus V. Eric of Pomerania succeeded, by separate titles, to Norway, Sweden and Denmark, and in 1397 was crowned king of the three kingdoms. Sweden then for a time became a separate kingdom; but the union between Denmark and Norway was drawn closer and closer, and the latter ultimately became a mere dependency of the former.

After the defeat of Napoleon by the allies in 1813 it was arranged in the treaty of Vienna in 1814 that Denmark must give up Norway, and the result was the union of the two countries under the Swedish crown, each remaining practically independent. The union was not unaccompanied by friction, partly owing to the democratic character of the constitution of Norway.

In 1905 Norway demanded a separate consular service, and was being refused. The Storting declared the union with Sweden at an end. Sweden acquiesced on certain conditions, and Norway having (by plebiscite) decided to remain a monarchy, Prince Charles of Denmark was invited to be king, and now (1911) rules as Haakon (or Hak) VII.

**OMAN** or Muscat (Muskat), an Arab state on the Gulf of Oman, was conquered by the Portuguese under Albuquerque in 1507, but recovered by the Arabs in 1648. In 1708, they acquired possession of the coasts of Laristan and Moghistan, the islands of Kishin and Ormus, and the town of Bender Abbas in Persia, paying to the shah a rent or tribute of 6,000 tomans. The state was very prosperous under the wise and mild sway of Said Bek, who succeeded to the throne in 1803 and reigned till his death in 1856. In 1854, the Imams were driven from their Persian dependencies, which in their opinion belonged to them as perpetually as long as they paid the rental. They recaptured Bender Abbas, but in consequence of English interference, they were compelled to conclude a treaty with Persia in 1856. Said appointed his son Majid to succeed him in Zanzibar, and his son Thuwayb to succeed him in Muscat. The latter was murdered by his son Salim in 1869, who reigned for a short time, but was driven out by the ruler of Zanzibar, Tukay. In consequence of the unsettled state of affairs in Muscat, Persia assumed the government of Bender Abbas and the Persian coast to remain practically on the footing of an independent Indian native state, and essentially under British protection.

**Reference.**—Gobian's *Three Years in Asia*.

**PANAMA**, a republic occupying what was formerly called the Isthmus of Darien, was formerly a department of Colombia. It asserted its independence in 1903, and for a few years, when it was recognized by the United States, and has since been by the chief European powers.

Under Spanish rule the Panama territory formed part of the province of New Granada, which in 1718 became a viceroyalty. The isthmian territory was organized as a province under the viceroy. Before the close of the war of independence, New Granada, Ecuador, and Venezuela constituted themselves the Republic of Colombia (1819). In 1822 the province of Quito was liberated from the Spanish yoke. Soon there were three republics, Venezuela, Ecuador, and Quito, separating from New Granada (1829-31). Each of the states of the republic of New Granada, as the name indicates (United States of New Granada), was theoretically sovereign, with a limited range of activity assigned to the central government, with its seat at Bogotá.

Through successive usurpations, the powers of the central government were increased at the expense of the separate states. This tendency was partially checked by the adoption of a new constitution in 1858, and under the constitution of 1863, which was adopted after a protracted period of civil war, the autonomy of the states of Colombia (by which name the republic was now known) appeared to be assured. In the late seventies continuing tenacity against federal control, and after an ineffectual resistance on the part of the supporters of local autonomy, a new constitution was promulgated in 1886 which reduced the states to the rank of administrative departments, with governors appointed from Bogotá.

Panama suffered severely under the new régime. The development of trade, owing to the opening of the Panama railway in 1881, led to the importation of a French company, made this part of Colombia an exceptionally lucrative field for the corrupt operations of the government. Heavy taxes were levied upon Panama, and large bodies of Colombian soldiers were garrisoned in its territory to suppress the conspiracies which were constantly being formed against the government. From 1887 to 1890 several insurrections occurred, but were put down by the Colombian forces.

November 18, 1903, a treaty between the United States and Panama was signed, providing facilities for the construction and maintenance of the interoceanic canal. In this treaty, Panama grants in perpetuity the use of a zone five miles wide on each side of the canal route, and within this zone the exclusive control for police, judicial, sanitary and other purposes. For subsidiary canal or other territory is ceded, and for the defense of the canal, the coasted, and the islands in Panama bay are also ceded. The cities of Panama and Colon remain under the authority of the new state, but complete jurisdiction is granted to the United States in both the cities and in their harbors in all that relates to sanitation and quarantine. In return for these grants the United States paid \$10,000,000. The ratification of the treaty, and will pay \$250,000 yearly, beginning after nine years.

The treaty was ratified February 23, 1904, and in July, 1904, the provisional delimitation of the boundaries of the United States territory on the isthmus was signed. According to this agreement the city of Panama is, for all practical purposes, left without a single foreign consular agent, and the commerce of the city is concentrated at the wharf at Balboa, now called "Port Ancón," so far as ocean-going vessels are concerned, but the jurisdiction is granted to the same. Moreover, a similar port has been opened on the Atlantic entrance to the canal, called "Cristobal."

A treaty for the denaturation of the boundary between Panama and Costa Rica was signed on behalf of the respective governments on March 25, 1905, and ratified by Panama on January 10, 1907.

**PARAGUAY**, a South American republic, was discovered by Juan Dias de Solis in 1515, and settled as a province of the viceroyalty of Peru in 1535. The warlike Guaranis long successfully resisted the Spanish arms. In the seventeenth century the Jesuits, who had been placed in the Jesuits' hands the entire administration, evil as well as religious. From this time forward the progress of civilization as well as of Christianity was rapid.

On the expulsion of the Jesuits from Paraguay in 1768, the province was again made subject to the Spanish viceroys. In 1810 Paraguay joined with other states in declaring its independence. In 1814 Dr. Francia was proclaimed dictator, and exercised absolute power till his death in 1840. In 1865-70 the Paraguayans made a heroic but unavailing fight against the combined forces of Brazil, the Argentine confederation and Uruguay, closed by the defeat and death of the president, López, at the battle of Cerro Cora. In 1870 the Paraguayan report indicated marked national prosperity.

**PERSIA.**—The earliest account we possess of Persia is from the bible, from which we learn that in the thirteenth century Abraham, about 1921, that portion of modern Persia known as Elam, or Susiana, southern Persia, was a powerful monarchy. But as Persia, as a nation, first rose into notice on the ruins of the great empire founded on the Euphrates. Babylon was taken by Cyrus, and his empire extended wider than any of his predecessors in the world. It comprised on one side, the west of India; on the other, Asia Minor, Syria, and Egypt; and was only bounded by the prodigies of valor with which the Greeks defended their sacred territory. After a long struggle, it succumbed to the brave and disciplined armies of Alexander. It was then split into fragments by the decease of its founder; but the struggle for empire continued during several centuries, to reign over Asia.

About two centuries before Christ, Araces founded the monarchy of the Sassanians; and in the third century, after the dynasty of the Sassanids, who restored the name, with the religion and laws, of ancient Persia. They were overthrown by the Mohammedan invaders, who suffered in their turn from the successive invasions by the descendants of Genghis, Timur, and by the Turks, who entirely changed the aspect of western Asia. At length, in 1501, a native dynasty again arose under Ismail, who placed himself on the throne. His posterity having sunk into voluptuousness, Persia was overrun by the Afghans, who carried fire and sword through its remotest extremities, and reduced its proudest capitals to ashes. The atrocities of the Afghans were avenged, and the independence of Persia vindicated by Nadir Shah, who, after a short reign, was succeeded by his son, who threw a luster on his country, after his death it was almost torn to pieces by civil war, till the fortune of arms gave a decisive result to the contest, and Karim Khan. His death gave rise to another disputed succession, with civil wars as furious as before. At length, in 1794, Aga Muhammed, a eunuch, raised himself, by crimes and daring, to the sovereignty, and he completely swayed it during his lifetime, but founded the present dynasty.

Under his reign, Persia had wars with Russia in 1804 and 1828, and with England in 1856-7. Under the Berlin treaty in 1878, Persia acquired from Turkey the territory and city of Khotur. In 1881 the northeastern frontier was settled by a treaty between Russia and Persia, by which the former gained a fertile district of considerable strategic importance. In 1896 the shah, Naser-ed-Din, was assassinated at Teheran. Mirza Abbas Mirza, a eunuch, came to the throne in his country, 1907. Subsequently the shah broke his pledges, limiting the powers of the sovereign, and revolution ensued. He was

thereupon compelled to abdicate in 1909, and was succeeded by Ahmad Shah, his son. A new cabinet was formed in 1910.

**Peru.**—Of the early history of Peru we are almost entirely ignorant, but existing ruins, spoils secured by the Spaniards, and the descriptions left us by the historians of the Spanish conquest, sufficiently prove that the ancient Peruvians had no mean knowledge of architecture, sculpture, metal work, etc. They also had made considerable progress in astronomical science. The early religion of the Peruvians is bounded up in the god Viracocha, the creator of the sun and the stars, and from him the Incas or emperors claimed descent as the sons of the sun.

Under the Incas the empire was divided into four parts, corresponding to the four cardinal points; each division had a separate government, presided over by a viceroy of royal blood. All the land belonged to the Incas; and trade was carried on by barter, money being unknown. The thirteenth monarch of the Incas was reigning when the Spanish adventurer Pizarro disembarked in Peru in 1531. The Incas was taken prisoner (1532), numbers of his subjects were massacred, and the whole country fell in a short time into the hands of the invaders. It was then formed into a Spanish viceroyalty; subsequently part of it was incorporated in New Granada, and the viceroyalty of Buenos Ayres was constructed out of some of the provinces.

In 1821 the country proclaimed its independence, but did not obtain actual freedom

from Spanish rule until 1824, after a prolonged war. Peru, like the rest of the South American republics, has suffered much from dissensions and revolutions. In the spring of 1879 it joined Bolivia in a war against Chile, resulting in the complete defeat of both the former. Peru had to cede by the peace of 1883 the province of Tarapaca absolutely to Chile, which also got possession provisionally of the department of Tacna. Since then Peru, though little troubled with external complications, has been disturbed by the ambitions of rival politicians and even civil war. In 1909, a large national loan was obtained from France.

**Russia.**—The monarchy is usually regarded as having been founded by Rurik, about A. D. 862, his dominions, and those of his immediate successors, including Novgorod, Kiev, and the surrounding country. In 980-1015 Vladimir introduced Christianity, and founded several cities and schools. From this period down to 1240, when the country was overrun by the Tartars, Russia, with few exceptions, was the theater of civil war. In 1328 the seat of government was transferred to Moscow, and in 1481 the Tartars were finally expelled.

**The Romanoffs.**—In 1613 the house of Romanoff, whence his present majesty is descended, began to reign, and in 1649, when this period the empire acquired strength and consistency. Under Alexis Mikhailovitch (1645-76), White Russia and Little Russia were conquered, the Aukra, and the Cossacks of the Ukraine acknowledged the supremacy of the czar, various internal improvements were effected, and the power of Russia began to be felt and feared by all her neighbors.

**Under Peter the Great.**—At length, in 1696, Peter the Great ascended the throne, and the destinies of Russia and of the northern world were immediately placed in his hands. He became sole ruler in 1699, and occupied the throne till his death in 1725. He completed the conquest of Siberia, waged successful wars with Charles XII. of Sweden, and by the treaty of Nystat in 1721 obtained Esthonia, Livonia, Ingermannland, and part of Finland, thus gaining a large maritime territory on the Baltic. He founded St. Petersburg in 1703, and made it the capital in place of Moscow.

**The Eighteenth century** in Russian history is a century of oppression. Peter the Great was succeeded by his wife, Catherine II. (1762-7). A grandson of Peter the Great, Peter II., followed Catherine, reigning from 1772 to 1796. The next sovereign was Anna (1796-97), whose reign was a period of German influence. Ivan VI. (1740-1) was soon displaced by the anti-German party, and Elizabeth (1741-62), daughter of Peter the Great, ascended the throne. Elizabeth's reign was obtained by the treaty of Abo, and Russia took part against Prussia in the Seven Years' war. The first Russian university, that of Moscow, was founded in 1755.

The death of Elizabeth and the accession of Peter III. in January, 1762, greatly relieved the hard-pressed Frederick the Great, because Peter at once reversed the Russian policy. In July, 1762, he was deposed and murdered by his wife, Catherine II. (1762-96), whose reign is of great importance in the progress of Russian power. She added to the empire by the three partitions of Poland (1772, 1793, 1795), in which she had the principal share. The treaty of Küchuk-Kainarji, which concluded a war with Turkey in 1774, freed the Crimea from the suzerainty of the porte, and prepared the way for its annexation by Russia in 1783. The Crimean came under Russian protection in 1783, and Courland was incorporated in 1795.

**Napoleonic Period.**—In the Napoleonic period Russia took an important part. In the general history of Europe, Catherine II. and her successor, Paul I. (1796-1801), joined the second coalition against Napoleon, and a Russian army operated with some success in Italy and Switzerland, and the emperor formed an alliance with Napoleon. He was murdered in 1801, and his son, Alexander I. (1801-25), succeeded to the throne.

Alexander joined the alliance with Napoleon, but the battle of Austerlitz (1805) ended that alliance. He was then associated with Prussia, but the victories of Jena and Friedland, in 1806, broke the alliance. The bloody battle of Eylau (1807) was drawn, but at Friedland, in the same year, Russia was heavily defeated. Alexander then concluded the treaty of Tilsit with Napoleon, and supported the measures directed against British commerce. But the French alliance gradually became irksome to Russia. Ultimately Alexander repudiated Napoleon, and to punish him Napoleon made his disastrous march to Moscow in 1812.

The Russians cooperated in the later operations against France, and by the treaty of Vienna (1815) Poland was given to Russia.

By the treaty of Frederikshavn (1809) Finland was ceded by Sweden to Russia, but it kept its own constitution. Georgia was a subordinate kingdom. On the other hand, a war with Turkey, ended by the treaty of Bucharest (1812), gained Bessarabia for Russia; and the treaty of Tilsit (1813) deeded Persia of some territory in the Caucasus.

**The Alexanders.**—Alexander began his reign with liberal measures, but latterly he became more and more reactionary and despotic. He was the prime mover in the Holy Alliance of 1815, which aimed at the complete suppression of liberalism in every form. By his earlier liberal policy, however, he sowed the seeds of the revolutionary and constitutionalist movement.

The reign of his brother, Nicholas I. (1825-55), was, throughout, one of thorough reaction. Poland revolted in 1830, and was deprived of its constitution. The popular uprisings in Europe during 1848 alarmed Nicholas, who sent an army to the assistance of Austria against the revolution in 1849. On the other hand, he cooperated with Britain and France at Navarino (1827), and by making war on Turkey (1829-30) assisted in freeing Greece from the grasp of the empire. In 1829 gave Russia an accession of territory at the expense of Turkey, and in 1828 Erivan was conquered from Persia. Further designs on Persia and on the Crimea were abandoned (which see), but it was not concluded till after the accession of Alexander II. The treaty of Paris (1856) neutralized the Black Sea, and Bessarabia was returned to Rumania.

**Important Reforms.**—The reign of Alexander II. (1855-81) is one of the most important in Russian history. Russia's failure in the Crimean war caused her rulers to turn their eyes to home affairs, and to inaugurate a period of reform. The millions of serfs in the empire were liberated by the famous emancipation decree of 1861. The judicial system was reorganized, and the jury trial was introduced. A law of 1864 created provincial and district councils, known as *zemstvos*, in thirty-four governorates. Russia, Russian Rumania, and the representative bodies, called *dumas*, were established in many towns in 1870.

An insurrection in Poland in 1863 led to the withdrawal of its separate government, and in 1868 Poland was completely incorporated with Russia. Compulsory military service became the law in 1874. The government of the Baltic provinces was incorporated with that of Russia in 1876. The reforming energy of the government was exhausted by about 1860, and fear of its own work caused it to adopt a reactionary policy.

**Rise of Nihilism.**—From this time nihilism becomes a notable force in Russian politics, and its increasing strength led Alexander to make Leve-Melkoff practically dictator in 1881. Melkoff recommended a policy of moderate reform, and Alexander was about to issue a decree calling an assembly of notables when he was assassinated in St. Petersburg in March, 1881.

Alexander's reign witnessed a great advance of the empire in Central Asia and the Far East. Khiva and Bokhara were made states; Khokand, Tashkent, and Samarkand were conquered; and China ceded to Russia her present Amur and coast provinces on the Pacific and the northern half of the United States. In 1867, in the three great Prussian wars of his reign Alexander maintained strict neutrality, but without concealing his friendliness to Prussia. He refused to give aid to the French and to free himself from the Black Sea clauses of the treaty of Paris (1856).

**War with Turkey.**—The Russo-Turkish war of 1877-78 was partly the outcome of Pan-Slavism. It led to the treaty of Berlin (1878), under which Russia recovered Bessarabia.

Alexander II. was succeeded by his son, Alexander III. (1881-94), who soon reversed his father's liberal policy. Press freedom disappeared, and the kindred of the Romanoffs were again suppressed. The powers of the *zemstvos* were severely restricted in 1890, and the direct representation of the peasants on towns was abolished. The *dumas* were deprived of all real independence in 1892. Alexander II.'s judicial reforms were partly undone, and the village communities, known as *obshchinas*, were brought under the ministerial control of the land-owners. Russification was vigorously pursued in Poland and the Baltic provinces, and in 1890 the first steps toward the Russification of Finland were taken.

Alexander III. was not friendly to Germany, but avoided hostilities more serious than those of a tariff war, although the Bulgarian crisis of 1885 subjected their relations to a severe strain. Russia and France now began to draw close together, but a Franco-Russian alliance was not officially admitted till 1896-7, and its terms are still secret. Mary was annexed in 1884, and the occupation of Penjdeh in 1885 nearly led to war with Britain. Alexander III. escaped the German railway strike of 1896, and died of disease in November, 1894.

**The Far East.**—After the reign of Alexander III. comes the fateful reign of his son, Nicholas II. In 1896 China granted permission to occupy the Siberian railway (1899) through Manchuria to the far eastern Russian seaport Vladivostok. In December, 1897, in consequence of the Germans having extorted Kiauchow from China, the Russian fleet, under Port Arthur, and in the following year the obtained from China a lease of it and some neighboring territory, although in 1895 she had taken the chief part in preventing Japan from taking it. The price of victory was shared in the international expedition to China in 1900, and herself suppressed risings in Manchuria with the utmost energy. Professed to be ready to make even an evacuation of Manchuria as soon as possible, she was preparing for virtual annexation; but her aggressive action in Korea aroused Japanese opposition, and led to the war of 1904-5.

By the treaty of Portsmouth (1905), which ended this war, Russia lost—for the time being at least—all influence in Manchuria, Korea, and China, and had to cede to Japan Port Arthur and its territory, and also southern Sakhalin.

**The Czar's Peace Proposal.**—In 1898 the czar sent a proposal to all the powers suggesting a conference on armaments, and the result was the notable peace conference at the Hague in 1899. The machinery created by this conference proved sufficient to settle peacefully the serious dispute with Spain which arose out of firing of Russian warships on British fishing vessels at the Dogger Bank in October, 1904.

Nicholas II.'s internal policy has been, on the whole, reactionary, especially in regard to Finland, whose free institutions were one by one destroyed, until in December, 1903, she was deprived of the last remains of her government. Bobrikov, the governor who carried out this work, was assassinated in June, 1904; and in the following month De Helve, minister of the interior, the principal agent of the reaction, also fell a victim to assassination. He was succeeded by the liberal-minded Prince Sviatopolk-Mirsky, and for a time the czar seemed inclined to reform.

**Recent Reforms.**—Representatives of the *zemstvos* met in November at the invitation of the czar, and formulated a program of reforms. Similar meetings were held by gatherings of professional men, and by working-class organizations. A great strike occurred in St. Petersburg in January, 1905, and the strikers, led by priest named Gapon, were shot by the army on Sunday, January 22, 1905, to present an address to the czar at the winter palace. The czar had fled to Tsarskoe Selo, and the strikers were warned to discontinue their mercy. This was followed by a period of disorder approaching chaos throughout European Russia.

**The Imperial Duma.**—In August, 1905, the czar issued a manifesto ordering the election of an imperial representative *duma*; in Sep-

tember, Caucasasia, and especially Baku, was the scene of terrible disorders, during which the oil industry suffered severely. Near the end of October a general strike was declared the autonomy almost powerless, and on October 30 the czar was compelled to promise complete liberty and self-government. Count Witte was made president of a reorganised council of ministers, with instructions to form a reformist cabinet. The general strike in Finland compelled the czar to restore Finland a constitution and liberties. The bureaucrats have attempted to discredit the movement by instigating attacks on Jews, and other outrages, especially in Odessa, where the authorities have permitted appalling atrocities.

The imperial duma, promised in 1905, was duly elected early in 1906, and held its first meeting on May 10 at St. Petersburg. It was dissolved later in the year because too liberal, and a second one, elected in 1907, met the same fate. By various devices the government managed to get a less advanced duma elected late in 1907, which did some useful work in 1908. An important Anglo-Russian convention was signed in 1907.

**Salvador** is the smallest but most densely-peopled republic of Central America. It was originally called Cuscatlan, and was conquered by Alvarado in 1525-6. In the first half of the sixteenth century it was a province of the Spanish colony of Guatemala, but shared in the liberation from Spanish rule, which followed the Mexican uprising of 1821. It was for a short time included in the empire of Iturbide, after which it was a state in the Central American federation until the latter's dissolution in 1839.

Its present constitution was proclaimed in 1824, under the federation, and subsequently modified in 1836. The country is rich in gold and silver, and has a large foreign debt amounting, in 1911, to more than \$5,000,000.

**References.**—Squier's *The States of Central America*, and *Salvador*, Bureau of American Republics Bulletin 58.

**Scotland.**—When the Romans extended their conquests (54 A. D.) to the Forth and Clyde, the country beyond, known to them as Caledonia, was occupied by the Picts, a Celtic people (perhaps partly by Celticised Iberians) speaking Gaelic, who called their country Alban or Albion; while the south of what is now Scotland was possessed, like south Britain, by Cymric Celts, speaking a kind of Welsh. In the fifth century the Scots came from their home in Ireland into Argyllshire, and after centuries of war with the Picts, put the crown of Scots and Picts on the head of their king, Kenneth, in 843. The Scots, partially Christianised when they came to Scotland, as their great missionary, and by means of him and his followers converted the Picts, the Cymri, and the northern tribes of the English, who since the fifth century had established themselves in the eastern parts of Britain as far north as the Forth.

In the tenth century the country of the Picts and Scots came to be known by the name of Scotia (still then the name of Ireland), Nova Scotia, or Scotland; and it soon came to include all of what is now called Scotland, and for a time even Cumberland and Westmorland; Cymric Northeyde became permanently Scottish in the tenth century; and in the same century and the beginning of the next, Lothian, the Merse, and Teviotdale, all heretofore parts of the country of the English as any part of England, and more Anglian, perhaps, than any part of the south, were bestowed on the Scottish kings.

The reign of Malcolm Canmore (1057-93) was a period of social, political, and religious revolution. Malcolm, long an exile in England, married Margaret, the sister of Edgar Atheling. Malcolm and his saintly queen

(afterward canonised) encouraged the introduction of English customs and civilisation, the English language and English soldiers; and began the process which led to the conversion of the Scottish Church to Roman usages. English (Anglo-Saxon) settlers established themselves in large numbers outside of the already purely English region in the south-east, which more and more became the headquarters of the kingdom; and the Anglo-Saxons were soon followed by many Normans, bringing with them the influence of French culture.

David (1124-53) greatly promoted the well-being of church and state; and Scotland was a prosperous country till the death of Alexander III. (1286). Then the attempts of Edward I. of England to get Scotland incorporated by hook or crook with the rest of south Britain, led to the long, bloody, and destructive wars of independence, was disastrous to all save national spirit and energy; and for 400 years Scotland, though free, was poor, barbarous, and torn by dissension.

The Celtic element ventured, under the later kings, to the conclusion that, with the Saxon overlords at Bute in 1411, but were signally worsted. Bannockburn (1314) encouraged the nation to resist to the uttermost the superior might of England; and the adoption of the Reformation (Scotland adopted heartily the Presbyterian polity) were the crowns of England and Scotland united in the person of James VI. (1603). The Scots, enraged by the attempts of Charles I. to impose the Anglican ritual, fought stoutly with the English parliament against the king, but enthusiastically supported the Restoration.

Under Charles II. and James II. the national church was depressed, and the covenanteders persecuted; and the revolution was welcomed (1688) by the great bulk of the nation. The crown has been confirmed by the personal tie of the sovereign in 1603; the kingdoms were united by legislative union in 1707 (the Scottish church and the covenanteders maintaining, in spite of a good deal of Scottish discontent, and it was mainly the highlanders who, in 1715 and 1745, rose in defense of the claims of the ancient line of the exiled James II., under the old name of the young pretender). From Scotch history of Scotland may be regarded as merging in that of Great Britain.

**Serbia.**—Serbia was anciently inhabited by Thracian tribes; subsequently it formed part of the Roman province of Moesia. It was afterward occupied in succession by Huns, Ostrogoths, Lombards, Avars, and other tribes. The Servians entered it in the seventh century, and were converted to Christianity in the next century. They acknowledged the supremacy of the Byzantine emperors, but later made themselves independent, and under Stephen Dushan (1350-60) the kingdom of Serbia included all Macedonia, Albania, Thessaly, northern Greece and Bulgaria.

About 1374 a new dynasty ascended the throne in the person of Lazar, who was captured by the Turks at the battle of Kosovo (in Serbia) in 1389, and put to death. Serbia now became tributary to Turkey. At the end of the fifteenth century it became a Turkish province, and so remained for nearly 200 years. By the peace of Passarowitz, in 1718, Austria received the greater part of Serbia, with the capital, Belgrade. But by the peace of Belgrade, in 1739, this territory was transferred to Turkey. The barbarity of the Turks led to several insurrections.

At the nineteenth century Cerni-George placed himself at the head of the malcontents, and, aided by Russia, succeeded after eight years of fighting in securing the independence of his country by the treaty of Bucharest, 1812. The war was renewed in 1813, and the Turks prevailed. In 1815 all Serbia rose in arms under Milosh, and, after a successful war, obtained complete self-government. Milosh became the hereditary prince of the land. Milosh was compelled to abdicate in 1839, and was nominally succeeded by his son Miskin, who died imme-

diately, leaving the throne to his brother Michael. In 1842 this prince was compelled to follow the example of his father and quit the country.

Alexander Kara-Georgevitch, son of Csaery George, was elected in his stead; but in December, 1858, he also was forced to abdicate. Milosh was then recalled, but survived his restoration a little more than a year, and his son Michael succeeded him (1860), but was assassinated by the partisans of Prince Alexander July 10, 1868. The princely dynasty was then conferred on Milan (Obrenovitch), grand-prince of Serbia.

After the fall of Pieva, in the Russo-Turkish war of 1877-8, Serbia took up arms against Turkey, and by the treaty of Berlin (July 13, 1878) it obtained an accession of territory and the full recognition of its independence. It was erected into a kingdom in 1882. In 1885 a short war took place between Serbia and Bulgaria, resulting in favor of the latter. In 1889 Milan abdicated in favor of his son Alexander I. He and his queen were assassinated in 1903 and Prince Georgevitch succeeded.

**Siam** appears to have no place in history prior to A. D. 638, and the credible records go back only to 1350, the date of the foundation of Ayutthia, the old capital. The Portuguese established intercourse with Siam in 1511, but in the seventeenth century were gradually supplanted by the Dutch. English traders were in Siam very early in the seventeenth century, and the consequent massacre their factory at Ayutthia was abandoned in 1688. The French were expelled about the same time, and the trade was neglected until 1856, when Sir John Bowring's treaty again opened up Siam to European trade. Since that date western ideas of civilisation have been introduced to some extent, and a few of the younger youth are now sent to Europe for their education.

The present king is Chulalongkorn I., who was born in 1853, and succeeded his father in 1868. Like his father, he has had an English education, and speaks English. Recently considerable portions of Siamese territory next Cambodia and partly on the west of the Mekong have been acquired by France, and the French influence in Siam is a great area in eastern Siam is also recognised as under French influence, and, in 1909, Great Britain obtained important rights in a number of Malay states.

**Spain** was first known to the Phenicians, subsequently to the Carthaginians, and, in the third century before the birth of Christ, to the Romans. It was completely subdued under Augustus, after which it enjoyed tranquillity for nearly 400 years. This state of peace was disturbed by the irruption of the northern barbarians—the Suevi, the Vandals, and the Alans. Christianity was introduced about the end of the sixth century, the invasion of the Moors took place in the beginning of the eighth, and they overran the whole country in 711. The Moors were finally expelled in the year 1492.

Under Charles V., Spain made a great figure in the general affairs of Europe. He reigned forty years, and, in 1556, abdicated in favor of his son, Philip II. In 1598, he was bequeathed to his successor, Philip III., Belgium, Naples, Sicily, and Portugal. Charles II., the last prince of the Austrian branch, reigned from 1686 to 1700; after which began the well-known war for the succession of the Spanish dominions, in which the claim of Austria was supported by the great powers of Europe, and, notwithstanding the opposition of the allies, however, the grandson of Louis XIV. reigned in Spain, relinquishing the Belgic provinces to the house of Austria.

The first king of the French line, had a long and turbulent reign. After him Ferdinand VI., a prudent prince, introduced various reforms, and maintained peace; but,

he dying in 1759, his son, Charles III., went to war with Great Britain. Peace ensued in 1763, and continued till 1778, when Spain, after a neutral in the American war, declared independence, was prevailed on to take up arms against England, and obtained, at the peace of 1783, the Florida and Minorca.

Charles IV. succeeded to the crown in 1788, and became soon after a party to the coalition against republican France, which then declared war, and invaded Spain, but, after France, the first of the great powers, to conclude a treaty of peace in 1795. In little more than a year after this, the cabinet of Spain joined its late opponent, and declared war against Britain. The abdication of the royal family of Spain took place at Bayona in May, 1808. It was followed by the general resistance of the inhabitants to the invasion of their country by Napoleon I., and by the subsequent expulsion of the French by the troops of Great Britain combined with those of Portugal and Spain.

The dissatisfaction and indignation excited by the tyrannical proceedings of Ferdinand VII. in the beginning of 1808, of great importance, by which the constitution of the cortes, as established in 1812, was restored, and such salutary reforms established, as the crown, and the crown as seemed best calculated for securing the rights of the people.

In 1823 Spain was again invaded by French troops, under the Duc d'Angoulême, whose object was to put down the new government, and to restore Ferdinand to absolute power. They penetrated the country without resistance; and, having laid siege to Cadix, the king was given up to them, and afterward the town. In 1833, on the death of Ferdinand VII., the queen-mother, Christina, was appointed queen-regent during the minority of her son, Isabella II., to whom, by his will, he bequeathed his throne. On this, Don Carlos, the late king's brother, laid claim to the crown, when a civil war, which lasted till 1840, ensued. In 1840, the partisans of Don Carlos were finally defeated.

The next event of importance was the contest between Ferdinand VII. and his queen-dowager Christina, for the supreme power during the minority of the queen. Espartero was successful from 1840 to 1843, but was compelled to flee before Don Carlos and Narvaez, and was not restored till 1847. Espartero's success had obliged Christina to retire to France, whence she returned after his fall, Narvaez and the moderados having control of the government. Isabella was now declared of age, married her cousin, Francis of Assisi, and succeeded to the throne as Isabella II.

During her reign Spanish history presented a dismal picture of faction and intrigue, the queen leading a dissolute life, and the liberals and conservatives successively gaining control of the government. The disputes finally ended in a successful revolt of the liberals, the queen being obliged to fly to France, and the throne being offered in 1870 to Amadeus, a son of Victor Emmanuel. Finding his task too difficult, he resigned in 1873.

A republic was now formed, with Castelar as leading spirit, but it was soon brought to an end, and the throne was offered, in 1874, to Alfonso, the young son of the exiled Queen Isabella. The death of Alfonso XII., at the age of twenty-eight, in 1885, threw upon his widow, Maria Christina of Austria, the burden of the regency (till 1902) for her then unborn son, Alfonso XIII., the present king (1902-1909). During his reign the material progress of the nation was considerable, and the financial condition became more hopeful.

Owing to the bad faith of the conservative party (1879), the promise made by Martines Campos of reforms in Cuba was broken, and the secession of the colony became inevitable. All that was left of the old Spanish empire of the west was lost in the consequent war with the United States in 1898, and Spain was free of what for years had been a burden to her.

In May, 1906, King Alfonso married Prin-

cess Victoria Eugenie, daughter of Prince Henry of Battenberg, the youngest sister of the late King Edward VII. The life of the king has been attended several times, and at the beginning of 1911 the spirit of popular government threatened to overturn the monarchy.

**Sweden.**—The history of Sweden before the union of Calmar in 1397 is rather obscure in its earlier part and rather confused throughout. Christianity was introduced by German missionaries in the ninth century, and the first Christian king, Olof Skötkonung, succeeded the throne about 1001, but for some time after there was a keen conflict between the Christian and the pagan parties.

One of the most notable men of this early time was Birger Jarl, a sort of mayor of the palace under Eric the Stammerer (1222-50), who gained so strong a position that he was able to have his son Valdemar seated on the throne in 1250. Valdemar was dethroned by his brother, Magnus Ladulås (1275-90), a vigorous ruler and wise lawgiver. Sweden and Norway came under the same monarch in the person of Magnus Småck, a nephew of Birger, in 1319, and with him began the series of events which led to the union of the Scandinavian kingdoms under the crown of Denmark and her nephew Eric of Pomerania (Eric XIII.) in 1397.

Margaret died in 1412, and thereafter Eric XIII. ruled alone; but his incompetence and oppression drove the Swedes to revolt under Engelbrecht Engelbrechtsson, and in 1436 he was compelled to appoint Charles Canutus, as regent in Sweden. In 1448 Charles of Oldenburg became king of Denmark and Norway, but the Swedes proclaimed Charles Canutus king; and after banishments and recalls he died king of Sweden in 1470. Sture, a nephew of Canutus, was appointed administrator in 1471, and King Christian was defeated in an attempt to enforce his claims. Charles VIII. succeeded in 1494, assisted by his son Hans, who invaded Sweden and established his authority in 1497. Sture was, however, recalled by the Swedes in 1500, and after his death, in 1523, Christian II. succeeded his father Hans in 1513, and thence invaded Sweden. Sten Sture the Younger was defeated and mortally wounded, and Christian was crowned at Stockholm in 1520. He signalled his coronation by wholesale executions, notably the Blood Bath of Stockholm, and in consequence a rebellion took place in 1521 under Gustavus Vasa, who in 1523 was proclaimed independent king of Sweden.

Gustavus Vasa, whose reign extended from 1523 to 1560, introduced the Lutheran religion as that of the state, and in 1544 he made the monarchy hereditary. He was succeeded by his eldest son, Eric XIV., a cruel and fanatical man, who was dethroned in 1569 by his brother John. John ascended the throne as John III., and caused Eric to be poisoned in 1577. He concluded the peace of Stettin, by which the separation of Sweden from Denmark and Norway was definitely ratified. John's son, Sigismund, who came to the throne in 1592, was brought up in the Catholic faith in Poland, but he refused to maintain the Catholic faith in Sweden. He did not keep his promise, and was deposed in 1599, Duke Charles of Södermanland, youngest son of Gustavus Vasa, being proclaimed regent.

In 1604 the regent was proclaimed king as Charles IX. On his death, in 1611, his son Gustavus II. (Gustavus Adolphus) ascended the throne. His famous military and political policy, his famous wars, and his negotiations the conclusion of wars begun by his father against Denmark and Russia, and played a great part in Germany in the Thirty Years' war. He met his death at the battle

of Lützen, in 1632, and was succeeded by his daughter Christina.

The peace of Westphalia, which ended the Thirty Years' war, in 1648, added to Sweden Bremen, Verden, and Alsace, parts of Pomerania, while Sweden already possessed, on the Russian side of the Baltic, Livonia, Esthonia, and other territories. Christina, who had left the real work of government to Axel Oxenstierna, abdicated in 1654, leaving as her successor Charles X., son of the sister of Gustavus Adolphus. Charles' short reign (1654-60) was a shadowy one, marked by wars with Poland and Denmark. Charles XI., son of his predecessor, came to the throne at the age of four.

The country was then long under a council of regency, but Charles assumed the government in 1672. He reorganized the army, adopting a regular system of conscription, and restored the finances. He died in 1697, and was succeeded by his son, the celebrated Charles XII. His career of conquest ended in the disastrous battle of Poltava, July 8, 1709, and he was killed at the siege of Frederickshald, Nov. 30, 1717, where he pushed the conquest of Norway. He was succeeded by his sister, Ulrica Eleonora, who in 1720 resigned the government to her husband, Frederick I., crowned prince of Holstein-Gottorp. The absolute authority which the crown had enjoyed under Charles XI. and Charles XII. was checked by the power of the nobles, and Sweden now lost most of her great eastern provinces, Ingria, Esthonia, Ingermanland, part of Finland, etc.

The struggles of the Hats and Caps, the former a war party, and the latter in favor of peace, began at the death of Frederick I. In 1751, Adolphus Frederick of Holstein-Gottorp was elected king. During his reign the country was distracted by the rivalries of the Hats and Caps, and the royal power sank into abeyance. Charles XIII. died in 1771, and was succeeded by his son Gustavus III., whose reign was distinguished by a monarchical revolution. He was assassinated at Stockholm by Count Arfvelson in 1792. His son Gustavus IV. was deposed, and his family declared forever incapable of succeeding to the crown, in 1809. His uncle, the duke of Södermanland, ascended the throne with the title of Charles XIII. Finland was finally ceded to Russia in 1809.

In 1810 the states elected Jean Baptiste Bernadotte crown prince. In the final struggle with Napoleon previous to 1814 Sweden joined the allies, while Denmark took the part of France. By the treaty of Kiel (1814) Sweden ceded to Denmark her last German possessions in Pomerania, while Denmark was compelled to cede Norway to Sweden. Norway resisted the cession, and accepted Charles as king only when he had agreed to their free constitution as a separate state. Bernadotte succeeded to the crown in 1818, under the title of Charles XIV. He died in 1844, and was succeeded by his son Oscar I., whose reign was singularly peaceful and uneventful. He died in 1859, and was succeeded by his son Charles Louis Eugene, under the title of Charles XV., whose reign was marked by constitutional reforms. Charles XV. died in 1872, and was succeeded by his brother Oscar II., a wise and prudent ruler. In 1905 the union between Norway and Sweden was dissolved by mutual agreement after negotiation and after the Norwegian legislature had decreed its dissolution. Oscar II. died in December, 1907, and was succeeded by his son Gustavus V., who reconstructed the imperial ministry in 1909.

**Switzerland.**—The origin of the inhabitants of Switzerland were the Celtic Helvetii, and the Rhetii, of doubtful affinity; both were conquered by Julius Cæsar and the generals of Augustus, and Romanized. Overrun by the Burgundians in the west, and their Germanic kinsmen, the Alemanni on the north, Helvetia became subject to the Frankish kings and was Christianized in the seventh century. Most of the territory was subject to the part of the Holy Roman empire; and in

1273 a Swiss noble, Rudolf of Hapsburg in Aargau, became German emperor.

Soon after Rudolf's death (in 1291) the inhabitants of Uri, Schwyz, and Unterwalden formed a league to defend their common interests, and in 1315 crushed an Austrian army at Morgarten. In 1332 Lucerne joined the alliance, and in 1353, Bern, Zurich, Glarus, and Zug. The Austrians were again routed at Sempach in 1386, and in 1388 at Näfels. The Swiss next had a fierce but triumphant struggle with Charles the Bold of Burgundy, whom they routed at Grandson and Morat in 1476, and finally at Nancy (where Charles was slain) in 1477.

When the reformation began there were

thirteen cantons, and the cantons took opposite sides from the beginning, not without serious turmoil and bloodshed. The treaty of Westphalia in 1648 recognised Switzerland as an independent state. Some of the cantons were strictly aristocratic and some highly democratic, and there was much discontent long before the French revolution, when, in 1798, between civil strife and French armies, the old republic (or rather alliance) came to an end.

The Helvetic republic of nineteen cantons, under French auspices, endured till 1805; then a new republican constitution was adopted, the Federal Pact of twenty-two cantons. On Napoleon's downfall Valais,

Neuchâtel, and Geneva, which had been incorporated with France, were restored, and Swiss neutrality and inviolability were recognised by the treaty of Vienna in 1815. Religious troubles led to a Catholic league in 1844, which was suppressed by the Federal forces in 1847. The present constitution was adopted in 1848, but revised in 1874. The most important recent event was the purchase of the railway lines by the state in 1898.

### HISTORIC TREATIES AND ALLIANCES

NAME OF TREATY	DATE	CHARACTER OF RESULT	NAME OF TREATY	DATE	CHARACTER OF RESULT
Adrianople	1829	Adrianople restored to Turkey by the Russians.	Munster	1648	Between France and the Emperor of Sweden. By this peace, the principle of a balance of power in Europe was first recognised.
Aix-la-Chapelle	1748	Between Great Britain, France, Holland, Hungary, Spain, and Genoa. A number of previous treaties renewed and confirmed.	Nankin	1842	Between the empire war between Great Britain and China.
	1818	Between the Allies and France. The latter pays 205,000,000 francs to the Allies.	Nantes, Edict of	1598	Henry IV. of France granted toleration to the Huguenots.
Amlens	1802	Treaty of peace between Great Britain and Holland, France, and Spain.	Nystadt	1721	Closed the war between Sweden and Russia.
Augsburg, League of	1686	Between Holland and other European powers to enforce respect for the treaties of Munster and Nimeguen.	Paris, Treaties of	1763	Terminated the Seven Years' war in America, and the French and Indian war.
Baden	1714	Terminating the war of the Spanish succession between France and the emperor.		1783	Terminated the American Revolutionary war.
Bast	1795	Between France and Prussia and between France and Spain.		1814	Settled the war between France and the Coalition.
Berlin decree	1806	Issued by Napoleon against the commerce of England.		1856	Terminated the Crimean war.
Breda	1667	Treaty between England, Holland, France, and Denmark.		1898	Terminated the Spanish-American war.
Breslau	1742	Between Maria Theresa of Austria and Frederick II. of Prussia.	Partition of Poland	1772	Secret treaty between Russia and Prussia at St. Petersburg.
Bretigny	1360	Treaty of peace that interrupted the Hundred Years' war between England and France.	Pasau	1755	Between Russia, Austria, and Prussia.
Calmar, Union of	1397	United Denmark, Sweden, and Norway under Queen Margaret of Denmark.	Perry's treaty	1854	Commercial treaty between United States and Japan.
Cambray	1608	League against Venice, comprising the pope, the emperor, and the kings of France and Spain.	Portsmouth	1805	Treaty between Japan and Russia.
Cambray, Peace of	1529	Between France and Charles V.	Prague	1866	Peace between Prussia and Austria.
Campo Formio, Peace of	1797	Between France and Austria.	Presburg	1805	Between France and Austria; ancient states of Venice ceded to Italy.
Carlowitz, Peace of	1699	Between Turkey and Austria, Poland and Venice. Humiliating concessions made by Austria.			Independence of Switzerland stipulated.
Carlsbad, Congress of	1819	Held by the German powers to protest against the progress of free institutions and popular rights.	Pratona	1902	Terminated the Boer war between Great Britain and Transvaal.
Coalitions against France	1792-1813	Led by England for the purpose of breaking down the French influence in Europe.	Pyrenees	1659	Between France and Spain; mutual concessions of territory made.
Concordat	1801	Between Napoleon I. and Pius VII., whereby the former was made in effect head of the Gallican church.	Quadruple Alliance	1718	Between Great Britain, France, the emperor, and Holland, for the purpose of guaranteeing the succession of the reigning families in Great Britain and France, and settling the partition of the Spanish monarchy.
Constance	1183	Between Frederick Barbarossa and the Lombard cities.	Rastadt	1714	Between France and Austria.
Copenhagen	1660	Between Denmark and Sweden.	Rastadt, Congress of	1797	Between France and the empire, established a general peace with the Germanic powers.
Fontainebleau	1807	Between Napoleon and the royal family of Spain.	Reichenbach	1806	Secession of the Germanic princes from the empire, to the cause of Napoleon, forming the Confederation of the Rhine.
Frankfurt	1871	Conclusion of the preliminary treaty of Versailles.	Ryswick	1697	Between France and the allied powers, closing the war of the "Patch Note."
Gastein, Convention of	1865	Between Prussia and Austria.	St. Clair-Sur-Epte	911	Terminated the war between the Norse and the Franks and Charles the Simple of France.
Ghent	1814	Between United States and England, closing war of 1812.	Saint Germain	1570	Between the Catholic and Huguenots.
Hague	1659	Between England, France, and Holland, with a view to preserve the equilibrium of northern Europe.	San Stefano	1878	This treaty, supplemented by the Congress of Berlin, closed the Russo-Turkish war.
Hamburg	1241	League with Subek, giving rise to the Hanseatic league.	Schoonbrunn	1809	Between France and Austria.
Holy Alliance	1815	A league between the emperors of Russia and Austria and the King of Prussia, by which they ostensibly bound themselves to Christian principles in political matters.	Shimonoseki	1895	Closed the war between Japan and China.
Hubertsburg	1763	Peace between Austria, Prussia, and Saxony.	Thorbe	1406	Settled the terms of the Polish conquest of western Prussia.
Jay's treaty	1794	Between the United States and Great Britain.	Tientsin	1858	Between China and each of the nations of Great Britain, France, Russia, and the United States.
Kiel	1814	Between Denmark, Sweden, and England. Norway and Sweden united.	Tilisi	1807	Between France and Russia, whereby Napoleon restored the Russian monarch one-half of his territories, and Russia recognised the Confederation of the Rhine, and the elevation of Napoleon's brothers, Joseph, Louis, and Jerome, to the thrones of Naples, Holland, and Westphalia.
Kutchuk-Kainardji	1774	Between Turkey and Russia.	Tolentino	1797	Between the Pope and the French.
League, Catholic	1576	Formed to prevent the secession of Henry IV. of France.	Triple Alliance	1668	Between the States-General and England against France for the protection of the Spanish Netherlands.
London	1810	Quadruple treaty between Great Britain, Austria, Prussia, and Russia on the one hand and Turkey, touching the states of Egypt.			Sweden afterward joined the league.
Lunenburg	1801	Between France and Austria and the German empire.			Between Austria, Germany, and Italy.
Madrid	1526	Treaty between Charles V. and Francis I.			

## HISTORIC TREATIES AND ALLIANCES—Continued

NAME OF TREATY	DATE	CHARACTER OR RESULT	NAME OF TREATY	DATE	CHARACTER OR RESULT
<b>Troyes</b>	1420	Between England, France, and Burgundy, whereby Henry V. of England succeeded to the throne of France.		1738	Treaty of peace between Germany and France; Loraine ceded to France, and France guaranteed the Pragmatic sanction.
<b>Ulm</b>	1620	Frederick V. lost Bohemia.		1809	Treaty of peace between Napoleon and Francis II. of Austria. Austria ceded to France the Italian provinces.
<b>Utrecht</b>	1713	Terminated the wars of Queen Anne of England, and secured the Protestant succession in England, and enlarged British colonies in America.		1815	Treaty between Great Britain, Austria, Russia, and Prussia, confirming the treaty of Chaumont.
<b>Utrecht, Union of</b>	1579	Foundations of the Dutch republic laid.		1815	Treaty between the Low countries, and Great Britain, Russia, Austria, and Prussia, agreeing to the enlargement of the Dutch territories, and vesting the sovereignty in the house of Orange.
<b>Valençay</b>	1613	Between Napoleon and Ferdinand VII. of Spain, whereby the latter regained full possession of his kingdom upon agreeing to maintain its integrity.		1815	Federative constitution of Germany signed.
<b>Verdun, Contract of</b>	843	Concluded the war between Lothair, Louis the German, and Charles the Bald, and settled their respective imperial dominions after the death of their father, Louis the Pious.	<b>Warsaw</b>	1683	Alliance between Austria and Poland against Turkey, in pursuance of which John Sobieski assisted in raising the siege of Vienna.
<b>Verona, Congress of</b>	1822	Held by the great powers to adjust Spanish and Grecian disturbances.		1768	Treaty between Russia and Poland.
<b>Versailles</b>	1783	Between Great Britain and the United States to settle American claims.	<b>Washington</b>	1842	Ashburton treaty defined the north-western boundary between the United States and Canada.
	1783	Between Great Britain, France, and Spain.		1871	Between Great Britain and the United States to adjust the Alabama claims.
	1871	Between France and Germany; William I. proclaimed emperor of Germany.	<b>Westphalia</b>	1648	Treaty of peace between France, Germany, and Sweden, terminating the Thirty Years' war.
<b>Vienna</b>	1725	Between the emperor of Germany and the king of Spain, settling the sovereignty over certain parts of the Spanish dominions.	<b>Worms, Concordat of</b>	1122	Between the emperor and the pope, elevating the papal office call the law of investitures.
	1731	Treaty of alliance between Germany, Great Britain, and Holland, by which the Pragmatic sanction was granted, and the Spanish succession settled.	<b>Worms, Diet of</b>	1521	Imperial convocation before whom Luther was summoned and presented.
			<b>Zürich</b>	1859	Closed the dispute between Austria and France and Sardinia.

**Turkey**, or the Ottoman empire, comprises the wide but heterogeneous territories really or nominally subject to the Osmanli sultan, in Europe, Asia, and Africa. These territories which once extended from the Danube to the cataracts of the Nile, and from the Euphrates to the borders of Morocco, were greatly reduced in the nineteenth century.

A small tribe of Turks forced their way into Armenia in the thirteenth century, and helped the Seljuks against the Mongols; in the fourteenth century the Turks under the name of Othman conquered the Seljuik kingdom, and became known as Osmans or Ottomans. By 1336 they pushed their way to the Hellespont; under Murad I. (Amurath) they occupied Adrianople and Philippopolis, received homage from the kings of Serbia and Bulgaria, and practically held all the Balkan peninsula except Constantinople, which, after much fighting, fell before Mohammed II. in 1453. In the same century they conquered Albania, Greece, the Crimea, etc.; and in the sixteenth, Syria, Egypt, Tunis, Hungary, and south Russia, and had wars with the Russians, Persians, and Venetians.

Their star began to decline in the seventeenth century; in 1682 they were driven back from Vienna, and lost Hungary, Transylvania, and Podolia. In the eighteenth century the Russians were their most successful enemies, wresting from them the territories from the Dniester to the Caspian. Greece attained independence in 1828, though Egypt failed to throw off its allegiance. The Crimean war (1854-7) was fought in aid of the Turks against the Russians. The next great crisis, after risings in Herzegovina, Bulgaria, and Servia, was the Russian war of 1877-8. The worst Armenian massacres were in 1895-6. Turkey held her own against Greece in 1897; Crete was put under an autonomous government in 1898. But the Macedonian question was acute in 1903-6.

A form of constitution modeled on that of western European countries was suggested by various reformers from 1860-78, but until 1908 the rule of the sultan was based on the precepts of the Koran. On July 24, 1908, an imperial irade promulgated a constitution which entailed an elective legislature. In consequence of a long period of misrule the sultan, Abdul Hamid II., was deposed in 1909, and he was succeeded by his brother, Mohammed V.

**United States.**—**Exploration.**—The territories now occupied by the United States of America, which were probably visited on their northeastern coast by Norse navigators about the year 1000, continued the sole possession of numerous tribes of Indians (who had earlier and extinct races), until the discovery of America by Columbus, 1492. In 1498 an English expedition, under the command of Sebastian Cabot, explored the eastern coast of America from Labrador to Virginia; the settlement in 1607, when Ponce de Leon landed near St. Augustine in Florida, and explored a portion of that region in a romantic search for the fountain of youth. In 1520, some Spanish vessels from St. Domingo were driven upon the coast of Carolina. In 1521, by the conquest of Cortes and his followers, Mexico, including Texas, New Mexico, and California, became a province of Spain. In 1539-42, Ferdinand de Soto led a Spanish expedition from the coast of Florida across Alabama, and discovered the Mississippi river. In 1584-5, Sir Walter Raleigh sent two expeditions to the coast of North Carolina, and attempted to form settlements on Roanoke island.

**Colonial Settlements.**—A Spanish settlement was made at St. Augustine, Fla., 1565, when the settlements in Massachusetts, New York, then called the New Netherlands, 1613; Plymouth, Mass., 1620. A large part of the country on the great lakes and on the Mississippi was explored by La Salle in 1682; and settlements were made by the French at Kaskaskia and Arkansas Post, 1685; Mobile and Vincennes, 1702. The first effort at a union of colonies was in 1642, when the settlements in Massachusetts, New Hampshire, Rhode Island and Connecticut formed a confederacy for mutual defense against the French, Dutch, and Indians, under the title of "The United Colonies of New England."

**French and Indian War.**—They experienced the benefits of united action in 1754, when an English grant of lands to the Ohio company brought on the French and Indian war—the French claiming, at that period, as the first explorers, northern New England, half of New York, and the entire Mississippi valley. George Washington was sent on his first expedition, to remonstrate with the French authorities; and the colonies being advised to

unite for general defense, a plan for a general government of all the English colonies was submitted and presented; but it was rejected by both the colonies and the crown—by the colonies, who wished to preserve their separate independence, and by the crown from a jealousy of their united strength.

The colonies, however, took an active part in the war. Under Major Washington, they joined General Braddock in his unfortunate expedition against Fort Duquesne, near Pittsburg. They were victorious at the battles of Louisbourg, Ticonderoga, Crown Point, Niagara, and Quebec. The English area was enormously increased after the great struggle with the French, and in 1763, the peace of Paris, France gave up all her claims to Canada and all lands east of the Mississippi and north of Florida. Spain also ceded most of her holdings.

**The Spirit of Democracy.**—The principles of a democratic or representative government were brought to America by the earliest colonists. The colonies themselves were founded by private adventure, with very little aid from government. The Plymouth colony was for eighteen years a strict democracy, and afterward a republic under a charter from the crown. A representative and popular government was established in Virginia in 1620. It was not until the Protectorate and the reign of Charles II. that the colonies were considered as portions of the empire, to be governed by parliament. Then when navigation acts were passed to give English ships a monopoly of commerce, when the produce of the colonies was required to be sent to England, and duties were levied on commodities sent from one colony to another, protests were made against these assumptions; Virginia asserted her right of self-government; and it was not until the English revolution of 1776 that uniform relations with the different colonies were established.

**Introduction of Slavery.**—In 1713, by the treaty of Utrecht, England, which, since the reign of Elizabeth had imported slaves from Africa into her American and West Indian colonies, obtained a monopoly of the slave-trade, engaging to furnish Spanish America, in thirty years, with 144,000 slaves. A great slave-trading company was formed in England, one-quarter of the stock being taken by Queen Anne, and one-quarter by the king of Spain, these two sovereigns becoming the greatest slave-dealers in Christendom. By this monopoly, slavery was extended in, and

to some extent forced upon, all the American colonies.

At this period there was a general feeling of loyalty toward the mother country. The sons of the more wealthy colonists, especially in the south, were educated in England; English literature pervaded the colonies; the British throne was the fountain of honor; the colonies, though distinct and different in origin and character—Puritan in the east, Dutch Reformed in New York, Quaker in Pennsylvania, Catholic in Maryland, and Church of England in Virginia—were united by language, common ties, fears, and interests.

**Union and Independence.**—In 1761 the enforcement of the navigation act against illegal traders, by general search warrants, caused a strong excitement against the English government, especially in Boston. In 1766 the passing of an act of parliament for collecting a colonial revenue by stamps caused general indignation, and led to riots. In 1766 the stamp act was repealed; but in 1767 duties were levied on glass, paper, printer's colors, and tea. This renewed attempt met with a general resistance, and a number of tea were thrown into the harbor of Boston. To punish this measure, parliament passed the Boston port Bill, 1774, by which the chief town of New England was no longer a port of entry, and its trade transferred to Salem.

To enforce the act of the government, a fleet conveying 10,000 troops was sent from England, while the colonists prepared to resist the unconstitutional assumptions of the mother country. The first encounter took place at Lexington, April 19, 1775. A congress of the colonies assembled at Faneuil-hall, which resolved to raise an army of 20,000 men, and appointed George Washington commander-in-chief. June 17, Bunker Hill, in Charlestown, near Boston, where 1,500 Americans had barely intimated resistance, was taken by assault by the British troops, but with so heavy a loss that the defeat had for the Americans the moral effect of a victory. After a few days' privation and suffering, the British were compelled to evacuate Boston, carrying away in their fleet to Halifax 1,500 loyal families.

The British government now put forth a strong effort to reduce the colonies to submission. An army of 55,000 men, including 17,000 German auxiliaries (Hessians) was sent, under the command of Sir William Howe, to put down this "wicked rebellion." On June 7, 1776, Richard Henry Lee, of Virginia, offered a resolution in congress, declaring that "the united colonies are, and ought to be, free and independent states; that they are absolved from all allegiance to the British crown; and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved."

**Declaration of Independence.**—This resolution, after an earnest debate, was adopted by the votes of nine out of thirteen colonies. A committee, consisting of Thomas Jefferson, John Adams, Benjamin Franklin, Thomas Paine, and Robert R. Livingston, was instructed to prepare a declaration in accordance with the above resolution; and on July 4, 1776, the Declaration of Independence received the assent of the delegates of the colonies, which thus dissolved their allegiance to the British crown, and declared themselves free and independent states, under the general title of the Thirteen United States of America.

**War of the Revolution.**—The first campaign of the war was disastrous for the Americans, and for the moment the prospects of the cause of freedom looked gloomy. But in the midst of the general depression, Washington, sustained by the firmness of Congress, maintained his fortitude and confidence in final success. Carefully watching the opportunity to retrieve the credit of the American army, he defeated the British forces at Trenton, December 25, 1776; and his exploits in the following campaigns revived the spirit of the nation, and confounded and dismayed the enemy.

In 1780 England sent an additional force of 35,000 troops, and a strong effort was made to subjugate the Carolinas, where the

war became of a bitter partisan character, and was conducted with spirit by Sumter, Marion, and other southern chieftains. Lord Cornwallis, with a large army, retreated from Charleston, through North Carolina, and arrived in Virginia, where he was confronted by Lafayette, Wayne, and Steuben. In the month of September the British were driven upon the coast with a powerful French fleet, and 6,000 soldiers of the élite of the French army, under Count de Rochambeau. Cornwallis was obliged to fortify himself at Yorktown, Blockade by the Count de Grasse, and besieged by the allied army of French and Americans, waiting for Sir Henry Clinton to send him relief from New York. On October 19, 1781, he was compelled to surrender his army of 7,000 men.

This event produced such a change of feeling in England as to cause the resignation of the ministry, and the dispatch of General Sir Guy Carleton to New York with an offer of terms at Peace. The preliminaries were signed at Paris, November 30, 1782; and on September 3, 1783, peace was concluded between England and France, Holland, and America. The independence of the thirteen several states was acknowledged, with a liberal settlement of territorial boundaries. In April a cessation of hostilities had been proclaimed, and the American army disembarked at New York, which had been evacuated by the English through the whole war, was evacuated November 25th; and on December 23 General Washington took leave of his companions and returned to the hands of Congress his commission as commander.

**The Constitution.**—In 1787 a national convention met at Philadelphia, May 14, and after four months' deliberation adopted the present constitution of the United States, and submitted it to the people for ratification. After a thorough discussion, lasting in some of the states for two or three months, the constitution was accepted by all of them; first by Delaware, December 7, 1787, and lastly by Rhode Island, May 27, 1790. This constitution, which was the result of compromise by agreement, came into operation in March, 1789, and George Washington was elected the first president.

**Organization of the Government.**—The Congress appointed by the thirteen states then proceeded to impose duties, establish a federal judiciary, organize the executive administration, fund the debt of the United States, and establish a national bank. In 1793 Washington was unanimously reelected president. During his administration the states of Vermont, Kentucky, and Tennessee were admitted into the union.

In 1796 Washington, worn and irritated by partisan conflicts and criticisms, refused a third election, and issued his farewell address to the people of the United States, warning them against the dangers of party-spirit and disunion, and giving them advice worthy of one who was said to be "first in war, first in peace, and first in the hearts of his countrymen." John Adams was reelected president; and Thomas Jefferson, the second choice of the people for the presidency became according to the rule at first adopted, vice-president. In 1798 the commercial republics of France, and the assertion of the right to search and capture American vessels, nearly led to a war between the two republics. In 1799 the nation, without distinction of party, mourned the death of Washington; and, in the following year, the seat of government was removed to the city he had planned for a capital, and which bears his name.

**Fall of the Federalists.**—The partiality of Mr. Adams toward England, the abolition of a federal army, and the passing of the alien and sedition laws, by which foreigners could be summarily banished, and abuse of the government, by special elections, had punished caused great political excitement, and such an increase of the Republican, or, as it was afterward called, the Democratic party, that the president failed of reelection in 1801; and being no election by the people, the House of Representatives, after thirty-five ballottings, chose Thomas Jefferson, the Republican candidate, with Aaron Burr for

vice-president; and the offices of the country were transferred to the victorious party.

**The New Domestic Policy.**—Internal duties, which a few years before had led to an insurrection in Pennsylvania, called the whisky insurrection, were abolished, and the alien and sedition laws repealed. Tennessee, Kentucky, Vermont, and Ohio had now been organized as states, and admitted into the union. In 1803 the area of the country was more than doubled by the purchase of Louisiana—the whole region between the Mississippi and Rocky mountains—from France for \$15,000,000. The infant navy was strengthened by a successful war with Tripoli. In 1805 Mr. Burr was elected for a second term; but Burr, having lost the confidence of his party, engaged in a conspiracy to seize upon the Mississippi Valley, and found a new empire, with its capital at New Orleans. He was tried for treason, but not convicted.

The commerce of America at this period was highly prosperous, her ships enjoying much of the carrying trade of Europe; but in May, 1806, England declared a blockade from Brest to the Elbe, and Bonaparte, in revenge, declared the blockade of the coasts of the United Kingdom. American vessels were captured by both parties, and were searched by British ships for British subjects, and those suspected of having been British were sent to England, according to the doctrine, "once a subject always a subject," impressed into the naval service.

Even American men-of-war were not exempted from this proceeding. The British frigate *Leopard* meeting the American frigate *Chesapeake*, demanded four of her men, and on refusal, fired into her, and the surprised *Chesapeake* struck her flag. British ships were thereupon forbidden United States harbors.

Jefferson, following the example of Washington, declined a third election; and, in 1809, James Madison became president. The French decrees, prejudicial to neutral commerce, were revoked in 1810; but the English continued a source of loss and irritation, while the American government refused to furnish service in British vessels. The feeling was increased by a night encounter between the American frigate *President* and the British sloop-war *Little Belt*, on May 16, 1811.

**War of 1812.**—On April 18, 1812, Congress was again declared by Congress, preparatory to a declaration of war against Great Britain July 19, for which Congress voted to raise 25,000 enlisted soldiers, 50,000 volunteers, and 100,000 militia. General Hull, with 2,000 men at Detroit, invaded Canada; but on being met by a small force of British and Indians, under General Brock, recrossed the river, and made a shameful surrender. He was sentenced to death for his cowardice, but pardoned by the president. A second invasion of Canada was made near Niagara by General Van Rensselaer. One thousand American militia stormed the heights of Queenstown, and the British general, Brock, was killed; but reinforcements arriving opportunely, the heights were retaken. American losses during the war were, however, compensated by victories at sea. August 19 the United States frigate *Constitution* captured the British frigate *Guerriere*; October 18 in *Appomattox* took the British frigate *United States* captured the *Macedonian*; December 29 the *Constitution* took the *Jean*. American privateers took 300 British vessels, and 8,000 prisoners.

In 1813 General Prevost crossed the Detroit river with a considerable force of British and Indians, and defeated General Winchester, with the usual results of savage warfare. In April 1814 the British took 4,700 men captured York (now Toronto), and about the same time another American force of 800 men was defeated with great loss by the British under General Rensselaer. The remainder of this campaign was wholly favorable to the Americans. The attempt of the British general, Prevost, on Sackett's Harbor was repulsed; the squadron on Lake Erie, commanded by Commodore Perry, captured the British frigate *Lawrence*, and the American flotilla of nine vessels, fifty-four guns; and this latter success enabled General

Harrison to invade Canada, where he defeated General Proctor in the battle of the Thames, in which the great Indian warrior-chief Tecumseh was killed.

Later, another invasion of Canada was attempted; and York was taken by General Dearborn; and an unsuccessful attempt was made to take Montreal. Villages were burned on both sides. The British also destroyed American shipping in Delaware bay. At the same period General Jackson defeated the Creek Indians in Alabama and Georgia, who had been excited to make war upon the frontier settlements.

In 1814 General Scott and Ripley crossed the Niagara, and sharp action, with no decisive results, were fought at Chippewa and Lundy's Lane, close by the great cataract. General Wilkinson also invaded Canada on the St. Lawrence, but was easily repulsed. A British invasion, via Lake Champlain, by General Sir George Prevost, with 14,000 men and a flotilla on the lake, was not successful. On the 6th of September, the British was defeated at the battle of Plattsburg, while the army was repulsed on shore, and retreated with heavy loss.

On August a British fleet ascended Chesapeake bay, took Washington but slight resistance, and burned the government buildings. A subsequent attack on Baltimore was unsuccessful. New York, New London, and Boston were blockaded, and a large expedition was sent against Mobile and New Orleans.

On January 8, 1815, General Packenham advanced with 12,000 men against the latter city, which was defended by General Jackson, at the head of 6,000 militia, chiefly from Tennessee and Kentucky, aided by a small force of artillery. The militia were sheltered by a breast-work, and the British assault was met with so deadly a fire of riflemen, that it was repulsed, with the loss of General Packenham and several others, with 700 killed and 1,000 wounded; while the entire American loss is stated to have only amounted to 71. This ill-planned and unfortunate action was fought a month after the peace had been concluded between England and America, and was followed by two naval actions in February and March.

Although during this contest fortune at first favored the Americans on the high seas, she changed sides completely from June, 1813, as if to counterbalance the disasters of the British on land. June 1 the *Chesapeake* was taken by the *Shannon*; June 3 the *Groveland* and *Essex* were captured by British gunboats; the *Aryus* was taken by the *Peacock* August 14; the *Essex* by the *Phoebe* and *Cherub* March 29, 1814; the *President* by the *Endymion* January 15, 1815; the only counterbalancing success being the sinking of the British sloop *Acorn* by the *Porpoise* September 8.

In December, 1814, the Federalists of New England held a convention at Hartford in opposition to the war and the administration, and threatened a secession of the New England states. In 1818 Commodore Porter, who had taken a distinguished part in the recent war, commanded an expedition against the Algerians—whose corsairs had preyed on American commerce in the Mediterranean—and dictated terms to Algiers, Tunis, and Tripoli.

The Democratic-Republican party having brought the war to a satisfactory conclusion, the Federalists of New England, in 1816, James Monroe was elected to the presidency, almost without opposition, in what was termed "the era of good feeling." A rapid emigration from Europe and from the Atlantic states to the richer lands of the west, had in ten years added six new states to the union. Difficulties arose with the warlike southern Indian tribes, whose hunting-grounds were invaded; and General Jackson, sent against the Seminoles, summoned to his aid the Tennessee volunteers who had served under him against the Creeks and at New Battle, defeated them, pursued them to Florida, took Pensacola, and banished the Spanish authorities and troops. In 1819

Florida was ceded by Spain to the United States.

**Missouri Compromise.**—In 1820 Alabama and Maine, a slave and a free state, were added to the union; and the question of the admission of Missouri arose in Congress—the question of its admission as a slave state. At the period of the Revolution slavery existed in all the states except Massachusetts; but it had gradually been abolished in the Northern and Middle states, except Delaware, and excluded from the new states between the Ohio and Mississippi by the terms on which the territory had been surrendered by Virginia to the union.

Under the constitution, slaves were not counted in full as a represented population; but by a compromise, three-fifths of their numbers were added to the whites. The slave states were almost exclusively agricultural, with free-trade interests. The free states were encouraging manufactures by protection. The two sections had already entered upon a struggle to maintain the balance of power against each other. After an excited contest, Missouri was admitted, with a compromise resolution, that in future no slave state should be erected north of the parallel of 36 degrees 30 minutes north latitude, the northern boundary of Arkansas.

During the second term of Mr. Monroe, in 1824, General Lafayette visited America, and was everywhere received with great enthusiasm.

In the presidential election of 1824 there were four candidates—John Quincy Adams, Andrew Jackson, Henry Clay, and William H. Crawford. There being no choice by the people, the House of Representatives chose Mr. Adams; John C. Calhoun being elected vice-president. Party and sectional feeling became stronger. Mr. Adams and Mr. Clay, who had heretofore acted with the party of Jefferson and Madison, were henceforth identified with what was called the National Republican, and later, the Whig, and finally, in union with the Anti-Slavery Republican party.

**National Democracy.**—The four years of Mr. Adams, during which there were violent contests on protection and the powers of the federal government to carry out public works with states, ended with a presidential election contest, which resulted in the triumph of the Democratic party, and the election of Andrew Jackson, with John C. Calhoun as vice-president. The bold, decisive, and impetuous character of General Jackson was shown in a general removal of those who held office, down to small postmasters and tide-waters, under the late administration, and the appointment of his own partisans. An act for the rechartering of the United States bank was met by a veto of the president, who declared it unconstitutional and dangerous.

In 1832 an Indian war, called the Black Hawk war, broke out in Wisconsin; but the passing of a high protective tariff act by Congress caused a more serious trouble. The southern Carolina declared the act unconstitutional, and therefore null and void, threatening to withdraw from the union if any attempt were made to collect the duties on foreign importations. The president prepared to execute the law by force. Mr. Calhoun resigned his office of vice-president, and asserted the doctrine of state-rights, including the right of secession, in the senate. A compromise bill, known as the Nullification act, was settled by a compromise bill, introduced by Henry Clay, providing for a gradual reduction of duties, until 1843, when they should not exceed 20 per cent ad valorem.

The popularity of General Jackson excited his reelection by an overwhelming majority against Henry Clay, the leader of the Bank, Protection, and Internal Improvement party; and he entered upon his second term with Martin Van Buren of New York as vice-president. The removal of the government deposits from the United States bank to certain state banks led to the failure of the bank, and after some years, the plan of Mr. Van Buren's plan of an independent treasury.

The Cherokee Indians in Georgia, who had attained to a certain degree of civilization, appealed to the president for protection against the seizure of their lands by the state; but they were told that he "had no power to oppose the assertion of the sovereignty of any state over its who may be within its limits"; and the Indians were obliged to remove to the territory set apart for them west of the Mississippi. In 1835 the Seminoles war broke out in Florida; and the struggle, insignificant in numbers, under the early leadership of Osceola, kept up hostilities for years, at a cost to the United States of several thousands of men and some \$50,000.

In 1837 Martin Van Buren succeeded General Jackson in the presidency. His term of four years was a stormy one, from the great financial crisis of 1837, which followed a period of currency expansion and wild speculation. All the banks suspended payment, and the great commercial cities threatened insurrection. Mr. Van Buren was firm in adhering to his principle of collecting the revenues of the treasury, and of separating the government from all connection with the banks. His firmness in acting against the strong sympathies of the northern and western states, and his rejection of 1837-8 also damaged his popularity; and in 1840 the election of General Harrison, with John Tyler for vice-president, was one of unexampled excitement, characterized by immense popular gatherings, political songs, the use of symbols, and the participation of both sexes to a degree hitherto unknown in America. The Whigs triumphed in nearly every state; General Harrison was inaugurated March 4, 1841; and the rush to Washington for offices was as great as the election had been exciting and remarkable.

Worn down by the campaign, and the office-seekers, General Harrison died in a month after his inauguration, and was succeeded by John Tyler, who, having been a Democrat, was not popular with the Whigs. He seems to have reverted to his former political principles. He vetoed a bill for the establishment of a national bank and other measures of the party by which he had been elected, and was succeeded by Daniel Webster, secretary of state, and others, Democratic or neutral, were appointed in their place.

During Mr. Tyler's administration the northeastern boundary question, which nearly occasioned a war with England, was settled by Mr. Webster and Lord Ashburton; a difficulty amounting almost to a rebellion was settled in Rhode Island; but the most important question agitated was that of the annexation of Texas. This annexation was advocated by the south, as a large addition to southern and slave territory; and, for the same reason, opposed by the Whig and Anti-slavery parties of the north. Besides, the independence of Texas, though acknowledged by the United States Senate, had been acknowledged by Mexico, and its annexation would be a *casus belli* with that power. The recent admissions of Iowa and Florida into the union had kept the balance of power between north and south, but Texas would be an advantage to the south. But the gain of territory, and a contempt for Mexico, overcame these objections, and in 1845 Texas was formally annexed to the United States, and James K. Polk of Tennessee succeeded Mr. Tyler in the presidency.

**The Mexican War.**—M. Almonte, the Mexican minister at Washington, protested against the annexation of Texas, as an act of aggression; and to guard against a threatened invasion of Texas, General Zachary Taylor was ordered, with the United States troops of his military district, to its southern frontier. The Mexicans crossed the Rio Grande, and commenced hostilities April 26, 1846. General Taylor moved promptly forward, and won the victories of Palo Alto, Resaca de la Palma, Monterrey, and Buena Vista, and gained great odds—20,000 to 4,750—the hard-fought battle of Buena Vista, a victory that excited great enthusiasm. In the meantime, General Taylor had been succeeded by General Winfield Scott, in northern Mexico; General Kearney to New Mexico; and Captain Fre-

Cumberland and Tennessee rivers (February 3), which led to the occupation of Nashville, the capital of Tennessee, henceforth held by the federalists—Andrew Johnson, formerly governor and senator, having been appointed military governor. Roanoke Island was also captured, on the coast of North Carolina. In March General McClellan, who had succeeded the aged Lieutenant-General Scott as commander-in-chief, commenced a movement on Richmond, the seat of the confederate government, now defended by General Lee.

On the 8th of March, the confederate iron-clad *Virginia*, constructed from the United States steamer *Merrimack*, which had been sunk at Norfolk, and raised by the confederates, attacked the federal fleet in Hampton roads, and in forty minutes sunk the *Confederate*, and set on fire and captured the *Congress* (frigate); while the other vessels took refuge in shoal water or in flight. The next day, the *Monitor*, a war-vessel of entirely novel construction, low and flat, with a revolving turret, invented by Capt. Ericsson, engaged the *Virginia*. The battle lasted two hours without result.

On the 6th of April a sanguinary but indecisive battle was fought near Corinth, Ala., the federalists being protected by gunboats. Soon after, Admiral Farragut, with a fleet of forty-five vessels, entered the Gulf at the mouth of the Mississippi river, and took New Orleans; while the armies and gunboats captured the fortifications on the upper part of the river as far as Memphis, Tenn., and the means General McClellan had besieged and taken Yorktown, and fought his way up the peninsula of the James river, until within five miles of Richmond, when he was beaten in a series of sanguinary battles, and driven, with a loss, in six days, of 15,000 men, to the shelter of his gunboats; while Generals Banks and Pope, sent to cooperate with him in the siege of Yorktown, were defeated and driven back by General "Stonewall" Jackson.

On the 1st of July the president called for 300,000, and August 4, 300,000 more men for the federal army. Congress abolished slavery in the District of Columbia, prohibited it in the territories and passed a resolution to compensate the masters in any State that would abolish slavery. He also authorized the president to employ negroes in the army, and to confiscate the slaves of rebels. In August the federalists were a second time defeated at Bull Run, and General Lee crossed the Potomac into Maryland, creating great alarm in Washington, and even in Philadelphia. General McClellan made a rapid march, and met him at Sharpsburg or Antietam. A drawn battle resulted in the retreat of General Lee, covering an immense train of provisions, horses, cattle, etc., which was probably the object of his expedition. A confederate invasion of Kentucky, about the same time, was attended with the same results. Another advance on Richmond was led by General Burnside, who had been shot, and General McClellan; but he was confronted by General Lee at Fredericksburg, and defeated in one of the most sanguinary battles of the war.

President Lincoln issued a proclamation declaring the freedom of all the slaves in the rebel states, which it was expected might cause them to rise against their masters; but it was without result. While the army of the Potomac was vainly endeavoring to advance on Richmond, the army of Tennessee, under General Rosecrans, with its base at Nashville, was trying to sever the Atlantic from the Gulf states, and cut the railways that supplied the confederate armies in Virginia. At Murfreesboro, Tenn., the Confederate General Bragg attacked General Rosecrans with the usual result of heavy losses on both sides, but no decided victory.

**Events of 1863.**—Early in May, 1863, General Hooker, who had succeeded General Burnside in the command of the army of the Potomac, crossed the Rappahannock, and was defeated by General Lee at Chancellorsville with great slaughter; but this victory was dearly bought by the loss of General

Jackson, mortally wounded in mistake by his own soldiers. General Lee now took the offensive, and invaded Pennsylvania, advancing as far as Harrisburg; but being met by General Meade, the new commander of the army of the Potomac, he was driven to a strong position at Gettysburg without success, and was compelled to recross the Potomac.

In the meantime the two principal fortresses of the Mississippi, Vicksburg and Fort Hudson, attacked by land and water, after a long siege, were starved into capitulation, and the entire river was open to federal gunboats. Charleston, which had since the beginning of the war, was now strongly besieged—its outworks, Fort Gregg and Wagner, taken, Fort Sumter battered in pieces, still held as an earthwork, and shells thrown a distance of five miles into the inhabited part of the city. In September, General Rosecrans had taken the strong position of Chattanooga, and penetrated into the northwest corner of Georgia, where he was disastrously defeated by General Bragg at the battle of Chickamauga.

At this period there was great peace-mongering in the north, and in New York against the conscription and the negroes; while the banks having suspended specie payments, the paper money of both federal and confederates was largely depreciated. The confederates were, however, cut off from all foreign aid, except what came to them through the blockade, and their own resources, both of men and material, were becoming exhausted. The railways were worn, many destroyed or occupied by the federalists, and it became difficult to transport supplies and feed armies. The federalists had command of the sea, and access to all the markets of Europe.

**Events of 1864.**—At the commencement of 1864 the federalists held, including the garrisons on the Mississippi, nearly 100,000 prisoners of war, and 40,000 federal prisoners, whom they could feed with difficulty, and who suffered great hardships. General Ulysses S. Grant, who had been successful at Vicksburg, was appointed commander-in-chief of the federal armies, and commenced a vigorous campaign over an immense area—in Virginia, the Carolinas, Georgia, Louisiana, and Arkansas, with the determination "to crush continuously against the armed forces of the enemy and his resources, until by mere attrition he should be forced to submit." Of the confederates, General Lee defended Petersburg and Richmond. General J. E. Johnston opposed the army of Tennessee at Dalton, Ga.; General Forrest was in Mississippi; General Taylor and Kirby-Smith commanded in Louisiana and Arkansas. In February, General Sherman marched from Vicksburg, making a destructive raid across northern Mississippi to Alabama. In March the federalists had 1,000,000 of men raised and provided for. The entire confederate forces probably numbered 250,000.

The army of the Potomac, commanded by General Grant, under the personal superintendence of General Grant, covered Washington, and advanced toward Richmond. General Butler advanced from Fortress Monroe up the James river, and General Sigel marched up the Shenandoah. Sherman united the armies of Tennessee, Cumberland, and Ohio, at Chattanooga, where he had nearly 100,000 men and 250 guns. General Banks and 60,000 men in Louisiana. In March General Banks moved up the Red river, toward Shreveport, but was defeated on the 24th, and driven back to New Orleans. The campaign of the Shenandoah valley commenced, and the army of the Potomac fought a series of battles at the Wilderness, Spotsylvania Courthouse, Jericho's Ford, North Anna, and Cold Harbor, with terrible losses. After the repulse, the federalists took up a new position further south, with a new base, until they had made half the circuit of the confederate capital. General Breckinridge defended Sigel in the Shenandoah valley, and once more threatened Washington. General Sheridan, with a strong cavalry force, drove back the confederates, and laid waste the

valley. In September General Sherman, advancing with a superior force, captured Atlanta. General Hood, superseding Johnston in the command of the confederates, was outgeneraled and beaten. While he marched against the city, General Sherman's base, and attack Nashville, where he was defeated, Sherman burned Atlanta, destroyed the railway, and marched boldly through Georgia to Savannah. The confederates made straggling victories, but with no permanent result.

**Events of 1865.**—The federalists made a new draft for 500,000 men. Expeditions were organized against Mobile, the most important confederate port, was taken by a naval and military expedition. Savannah and Charleston, approached in the rear by Sherman, were evacuated. The Cavalry raids cut off the railways and canal that supplied the confederate army in Petersburg and Richmond. Finally, on March 29, 1865, a series of assaults was made upon the confederate works, during ten days of almost continual fighting, until the confederates were worn down with fatigue. Richmond and Petersburg were evacuated April 2; and on the 9th of April seven, General Lee surrendered at Appomattox Courthouse, his army numbering 28,000.

At this period it is said that there was not less than 100,000 prisoners of war, the confederates striving to fight a single battle. On the 12th Mobile surrendered with 3,000 prisoners and 300 guns. Then General Johnston, in North Carolina, surrendered a few days after to General Sherman; and the trans-Mississippi confederate army followed his example.

Mr. Lincoln was in 1865 triumphantly re-elected to the presidency, with Andrew Johnson as vice-president. On April 14, while the north was rejoicing over the capture of Richmond and the surrender of the confederate armies, the president was assassinated at the theatre of Washington, by John Wilkes Booth, an actor. Andrew Johnson became president. Jefferson Davis and the members of the confederate government were supposed to be privy to the assassination of President Lincoln, and large rewards were offered for their apprehension. Mr. Davis was captured in Georgia, and placed in Fortress Monroe, but was released without trial in May, 1865.

**Reconstruction.**—An amendment to the constitution, forever abolishing slavery in the states and territories of the union, was declared ratified by two-thirds of the states December 18, 1865. The vast change in the organization of the republic made by this new fundamental law was completed by the fourteenth and fifteenth amendments, passed in 1865 and 1870, which gave to the former slaves all the rights and privileges of citizenship. The seceded states were readmitted to the union on condition of their adhesion to the constitution as thus amended.

In 1867 the United States secured by purchase the whole of Russian America. In 1872 the Alabama Court of Arbitration gave its decree in favor of the United States, while the same year the arbitration between Great Britain was settled on the same side by the emperor of Germany. The outrages of a secret organization known as the Ku-Klux Klan, in the southern states, retarded the passing of an act in 1871, giving cognizance of such offences to the United States courts.

The year 1876, memorable in the annals of the republic, the hundredth anniversary of the Declaration of Independence, was celebrated by a great centennial exhibition at Philadelphia. The presidential election of the same year was more than usual interest. General Ulysses S. Grant, chosen president in 1869, had been re-elected in 1873. When the result of the keenly contested election toward the close of the year was known, it seemed as if fortune had favored the Democratic party. But many of the returns from the various states were disputed; and for several months the interest excited by the presidential election was kept alive, selected from the Senate, the House of Representatives, and the judges of the supreme court, was appointed to examine the election

returns. The result was that Mr. Hayes, the Republican candidate, was declared to have been elected president, and inaugurated March 4, 1877.

President Hayes, soon after his inauguration, withdrew the federal troops from the south, saying that it was time to let the people govern themselves. The effect in the contested states was to return the Democratic governments to power, yet by 1879 the Republican senate was ready to approve of the president's course by agreeing to a law forbidding the use of federal troops at the polls. The year 1877 marks the close of an era in American history which began with the slavery dispute in 1850. During this time slavery was abolished and the doctrine of secession abandoned. With the restoration of home rule the country entered upon a period of united activity hitherto unattainable.

**Economic Problems.**—Since that time the issues have been for the most part of an economic character. Opinion has been divided upon problems of money, taxation, tariff, civil service reform, and the control of corporations, but with respect to party divisions the Republicans, either in the national legislature or in the executive chair, have been, except for two separate periods, not four years continuously in control to the present time (1911). Legislation has been throughout in favor of high protection, and with slight deviation on the side of sound money. Government, both national and state, has become more effective, and the history of the period is chiefly concerned with the persons and processes by which these results have been attained.

Prosperity was not uniform. The rush of activity and speculation after the war reached a crisis in 1873. Two or three years of depression were followed by industrial success until 1893, when another crash caused a halt. The country presently recovered and no interruption to prosperity has since occurred. Legislation has been concerned largely with economic questions, and party lines have been curiously obliterated on many economic questions.

A case in point was the demand for the inflation of the silver currency in 1878. The market price of silver had fallen to a ratio of about 20 to 1 in gold. The mine owners attributed this to the fact that the government had ceased to coin dollars in 1873, and the Greenback party, which desired more currency on principle, joined in the demand for increase of silver; this party (which later fused with the Labor party) also demanded the withdrawal of all bank currency in favor of national currency, and wished to have that part of the national debt not specifically payable in gold paid in currency. The party had for a time considerable strength in Indiana, Illinois, Kansas, Iowa, and Michigan. The Bland bill was passed, which at least two millions and not more than four millions per month to be coined into dollars at a ratio of 16 to 1. This continued for twelve years; silver passed its value for value like treasury notes. The national credit constantly improved. The debt was annually reduced in large payments, and in 1879 the government resumed specie payments.

In 1880 James A. Garfield of Ohio was elected president after a useful career in his state, in the war, and in Congress; but he had been only a few months in office when he was shot by an insane office-seeker, and after a lingering illness died (Sept. 19, 1881). Chester A. Arthur, of New York, vice-president, succeeded, and continued the Republican policy in a conservative manner. A halt was called in the appointment and removal from office for political reasons. The Jacksonian system had grown to a point where Republicans were removed to make place for henchmen of a rival candidate, and office-holders were regularly assessed for campaign expenses. The civil service act of 1883 provided examinations for the classified service, prohibited removals for political reasons, and forbade political assessments by a government official or in a government building. Out of this act the present system

has grown chiefly by expansion of the classes of officials to be affected.

**Democrats in Power.**—In 1884 the prosperity of the country had so increased that the treasury that the tariff became a real issue between parties. Two years before a commission had made wide inquiries through the country, and the Congress had been increasing rather than diminishing duties. The Democrats nominated Grover Cleveland, who as mayor of Buffalo and governor of New York of the country, had so far exceeded the hope of a purification of politics he attracted many independent voters, and defeated James G. Blaine, who in the course of a long and brilliant Congressional career had become as well as a devoted follower.

Cleveland was supported by a Democratic House, but the Senate was Republican; consequently tariff matters were at a standstill, but important laws on other subjects were enacted during his first term. The death of Vice-President Hendricks brought forward the presidential succession bill. In 1885 in case of a vote of both great officers, the president of the Senate and then the speaker of the House would succeed, but if neither house had elected a presiding officer, there would have been no one to take up the duties of president. The law of 1886, therefore, provided that the succession should first fall upon the secretary of state and after him, in order, the secretaries of war, treasury, the attorney-general, postmaster-general, secretaries of navy and interior. The continuation of the public policy desired by the party which elected the president would be thus assured.

The electoral count law prevented the recurrence of a situation like that of 1876. Hereafter each state shall be the judge of its own electoral vote, but if through opposing courts the state is unable to decide, the matter must be settled by joint resolution of the two houses of Congress.

The Interstate Commerce Commission was established in 1887. Hitherto Congress had given railways free rein, but the formation of huge systems and the combination of interests seemed to be competition for national legislation. The commission was given very limited powers, but it forms an interesting landmark in the interpretation of the commission to be placed in the constitution just a century before.

Mr. Cleveland showed great independence in vetoing private pension bills and other laws which he deemed unsuitable, sending back about three hundred without his signature. He stood in advance of his party upon the tariff question, particularly toward the end of his term, when the surplus revenues of the country exceeded \$55,000,000. The public debt was paid off so far as it was due, and the tariff, with its inequalities and war-time rates, went on piling up funds. "It is a consoling circumstance," he said, "that the phrase that caught the public ear," The President devoted to this subject the whole of his annual message to the Fifty-fifth Congress, but the Mills bill formed on policy was blocked in the Senate. Rather against the desires of the Democratic leaders, the tariff became the paramount issue in the presidential campaign of 1888.

**Republican Party Again in Power.**—Mr. Cleveland was re-nominated without opposition, and Benjamin Harrison of Indiana was put forward upon a strong protective platform. The Republicans were re-elected, and Mr. Harrison and by a vote of 233 against 168, although his popular vote was less than that of his opponent. Both houses of Congress were again Republican, and the result was taken as a mandate from the people to raise the tariff still more. In 1890 the McKinley bill increased the duties to an average of 50 per cent, but with some concessions to free trade and the provision for possible reciprocity with other countries.

The dependent pension bill gave a pension to any soldier or sailor who had served ninety days and was unable to earn a living. Widows, children and dependent parents were included. The pension list was nearly doubled, and the expenditures presently reached \$158,000,000 for that item alone.

The Bland bill was replaced by the Sherman bill for the purchase of an increased amount of silver. To keep up the price four and a half million ounces of bullion must be bought and stored in the treasury every month. Much valuable minor legislation stands to the credit of this Congress, but it is the decline of the surplus was spent. There was considerable popular discontent, which made itself felt in the ensuing presidential election.

**Cleveland Returned.**—President Harrison was re-elected, and Mr. Cleveland, in spite of the machinations of the politicians whom he had offended, was put forward again by the Democrats. The chief issue was again the tariff, but silver had near setting it aside. The decline of silver had not been arrested and there was a great call from the west and south for free coinage. Mr. Cleveland pronounced against it and offended many supporters, but there was also defection in the Republican party. A third party now appeared in formidable numbers. Hitherto the recent political groups had not drawn seriously upon the old parties, but socialist views of various kinds now united in the "Populist" party and profited by the cry for silver. Their cause was recovered over a million votes. The popular vote for Cleveland and Harrison were each over five millions, but Cleveland was elected by a large majority of electoral votes. The Congress in both branches was heavily Democratic.

When President Cleveland returned to office the situation was quite different from that of his first entry. Instead of a surplus there was stringency. Labor discontent and business depression were evident. Congress was called in special session to repeal the silver purchase bill and to protect the gold standard against silver currency. The project met obstruction in the Senate, where the mining states could make their votes the most effective, but eventually the purpose was accomplished.

The business depression became a financial panic in 1893, and the uncertainty lasted for several years. As the Democratic party was in power, the measure was not immediately thrown upon it; nevertheless, the leaders went forward with a revision of the tariff. The Wilson bill, as it came from the House, placed a small tariff on many commodities, substantially reduced the rates. In the Senate, Democratic though it was, the measure was altered beyond recognition; coal and iron ore were taken from the free list, and many duties raised. Mr. Cleveland was displeased, but as the duties were somewhat lower than the McKinley act he permitted the bill to become a law without his signature. An income tax law was passed, but was declared unconstitutional by the Supreme Court. A bill to coin the silver of the "seigniorage" was vetoed by the President.

No sufficient legislation having been enacted, the secretary of the treasury was obliged to take the unusual measure of borrowing money to keep up the gold reserve to the proper level. The Congress elected in 1894 reversed the majority in the House and made parties about equal in the Senate; consequently legislation during the balance of Mr. Cleveland's term was insignificant.

The Monroe doctrine came to life again suddenly in 1895 owing to a boundary dispute between Great Britain and Venezuela. Repetition of the doctrine had recently made to the English government, and the suggestions for a settlement having been as often declined, Mr. Cleveland sent a sharp message to Congress recommending the appointment of a commission to determine this boundary. The measure if carried out meant eventual war, but Congress voted unanimously for the commission. The British attitude, however, rapidly changed, and the result of the commission had finished its work the matter was settled with Venezuela by arbitration.

**The Silver Campaign of 1896.**—The demand for the free coinage of silver increased to such an extent that it became the chief issue in the presidential election of 1896. The Democratic party nominated William J. Bryan of Nebraska and gave the silver question the

foremost place in its platform. With them were the Populists and certain other small groups. The Republicans would have preferred to make the tariff the issue, but spoke clearly for sound money. The National Democratic party, or "Gold Democrats," drew some votes from the old party, but everywhere the mass of sound money voters cast their ballots directly for William McKinley, who was elected by a heavy majority.

Putting aside all considerations of persons and parties, the promptness with which the Americans rose in behalf of conservative finance was an interesting phenomenon. With a Republican congress, there naturally followed a return to the protective method in customs duties. The Dingley tariff bill was intended not only to restore the depleted revenues, but to maintain more than ever a certain theory of economic prosperity.

**The Spanish-American War.**—The chief event of this administration was the war with Spain on account of Cuba, which broke out in 1898. A rebellion in Cuba had been in progress since 1895 and was being suppressed by the Spanish authorities with great and unnecessary cruelties, bringing death to 250,000 Cubans. Repeated warnings from America had no effect. The American people were already exasperated when the United States battleship "Maine" blew up in the harbor of Havana. This was not the cause of war, but undoubtedly hastened American intervention. Congress voted war measures and war taxes by immense majorities. Hostilities began at Manila, in the Philippine Islands, where a Spanish fleet was destroyed on May 1, 1898, by Admiral Dewey. American forces by land and sea held the Spanish in check at Santiago de Cuba. On July 3, in attempting to escape, the Spanish fleet was utterly destroyed.

Peace negotiations were soon opened, and by the treaty of Paris, December 10, 1898, the island of Porto Rico was ceded outright to the United States, and the Philippine Islands on a payment of \$20,000,000. A Cuban republic was established under a protectorate of the United States. In the meantime, on request of the principal inhabitants, Hawaii was annexed.

President McKinley was inaugurated for the second term March 4, 1901, and died of pneumonia on September 6, following, and died September 14th, of the same year. He was succeeded by Vice-President Roosevelt, who, after the election of 1904, was inaugurated March 5, 1905, for a full term.

President Roosevelt at once set about initiating needed reforms in railroad, corporation, and trust methods, and in pushing forward the construction of the Panama canal. In 1906, a race war occurred at Brownsville, Texas, resulting in the colored troops stationed there being ordered out of the state, and in their subsequent expulsion from the United States army by order of the President. In March, 1907, the president issued orders for the dismissal of suits against the San Francisco school board. This action opened the way for negotiations between the govern-

ments of Japan and the United States, which culminated, early in 1908, in the complete restraint of Japanese immigration to the United States.

On March 4, 1909, William H. Taft became president of the United States, and James S. Sherman vice-president. His policy has been one of attempted compromise between the progressive and conservative wings of the party. His adhesion to the Payne-Aldrich tariff law of 1909 led to disastrous political results in the elections of 1910, and a serious conflict in his own party in 1911.

Portuguese and Dutch colonists from Brazil gradually established trading posts which brought them into close contact with the Spaniards, until in 1723 the latter usurped the heights on the Bay of Montevideo, from which the Portuguese were dislodged. Contests for supremacy ended in favor of the Spaniards. A British fleet attacked and captured Montevideo in 1807, but the failure of an attack on Buenos Ayres caused it to withdraw. In 1810 the people revolted against Spain, and in 1814 the Spanish forces were compelled to evacuate Montevideo. War with the Brazilians followed, and Uruguay was annexed to Brazil; but in 1825 a revolt was organized and in 1828 the independence of Uruguay was recognized. After a few years of peace civil war began, and continued until quiet was restored by the interference of Brazil in 1864. Uruguay then became an ally of Brazil and Argentina against Paraguay, and the resulting war lasted until 1870. From that year until 1903 the history of the republic was comparatively uneventful. In 1900, practically the entire railway system passed into British control.

Republics; Mulhall's *Handbook of the River Plate*; Keane's *Central and South America*; Martin's *Through the Andes*; Vincent's *Round and about South America*.

**Venezuela**, United States of, a republic of South America, on the Caribbean Sea, was discovered by Columbus in 1498; Ojeda and Vespucci followed in 1499, and entering Lake Maracaibo, they found an Indian village constructed on piles, to prevent the ill effects of inundation, and so called it, naming the place Venezuela, or Little Venice, a name which afterward spread to the whole country. The first settlement was made at Cumana in 1520 by the Spaniards; and it remained the capital of the colony until it asserted its independence in 1811, which was followed by a war of nearly eleven years' duration.

In 1813, it formed with New Granada and Ecuador what was called the republic of Colombia. The battle of Carabobo, fought June 24, 1821, destroyed the Spanish yoke and established the new republic. In 1830, on the dissolution of the confederation, Venezuela became an individual republic. The subsequent history of Venezuela was marked by a long period of civil wars, extending from 1847 to 1870, when Guzman Blanco became dictator and then president, holding the reins of power until 1890, when discord again broke out.

The next most important event in the history of Venezuela was its determined opposition to the alleged encroachments of Great Britain on its territory, through an extension of British Guiana, the inducement being, apparently, the discovery of a rich gold field near the border. The dispute, through the intervention of the United States, was submitted to arbitration.

The government of the republic, having been temporarily released from foreign interference, was soon confronted by insurrections, one of which, led by General Castro, was successful. In 1901 he was made president, but was compelled to resign, and several attempts to displace him. In October, 1902, the last of the insurrections was put down. Soon afterward the claims of France, Great Britain, Germany, and Italy, based chiefly on loans for public works and the demands of foreign property owners for compensation for losses, were urgently presented to the government. The French claims afterward were settled, but those of Germany, Spain, and Italy, having failed to collect the amounts demanded, joined in a blockade of Venezuelan ports and hostilities were begun. President Castro requested the United States minister at Caracas, Herbert W. Bowen, to arrange with the blockading powers for a final settlement of their claims. The question arose as to whether the blockading powers should be preferred in payment to those who had not made any hostile demonstration. Near the close of 1902 the matter was referred to the Hague tribunal, which decided in favor of the blockading powers. A new constitution was adopted in 1909.

### NOTABLE WARS OF HISTORY

The figures prefixed to the name of leaders and battles, etc., indicate to which of the two contending parties the leader belonged, or by which the victory was won; they correspond to the numbers used in the column giving the names of the contending parties. Battles given in *italics* were naval battles. Fuller details of the more important battles will be found in the table of Universal Battles given on page 147.

NAME OF WAR, CONTENTANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>1. TROJAN WAR.</b> (Mythical) 1200 B.C. (1) Greeks vs. (2) Trojans.	Greeks avenge the abduction of Helen of Troy by Paris.	(1) Agamemnon. Achilles, Ulysses. (2) Hector.	(1) <i>Siege of Troy.</i>	Capture and destruction of Troy. Schliemann's excavation identifies Ilium on the Hellespont as the site of ancient Troy.
<b>2. FIRST MESSENIAN WAR.</b> —8th Century B.C. (1) Spartans vs. (2) Messenians.	Spartans covet Messenian land.	(2) Aristodemus.	(1) <i>Siege of Mount Ithome.</i>	Messenians become tributary of Sparta and their land is in part confiscated.
<b>3. SECOND MESSENIAN WAR.</b> —c. 630-600 B.C. (1) Spartans vs. (2) Messenians.	Spartan oppression causes Messenian revolt.	(1) Tyrtæus (poet). (2) Aristomenes.	(1) Elira.	Greater part of Messenians flee to Sicily. Those remaining become Helots (Spartan serfs).

### NOTABLE WARS OF HISTORY—Continued

NAMES OF WAR, CONTRASTANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>4. FIRST SACRED WAR—</b> c.590-569 B.C. (1) Amphictyonic League vs. (2) Crotona.	People of the city of Croia (port of Delphi) oppress pilgrims to the oracle.	(1) Cleisthenes of Sicyon.	(1) Siege of Croia.	For the first time Greek cities join in an effective league. Croia destroyed.
<b>5. PERSIAN WARS—</b> 500-479 B.C. (1) Persians vs. (2) Greeks. a. First Persian Expedition—493 B.C. b. Second Persian Expedition—480-479 B.C. c. Third Persian Expedition—481-480 B.C. d. Fourth Persian Expedition—479 B.C.	Aid given by Athens and Eretria to revolting Ionian Greek cities, leading to burning of Sardis, C. 495. Continued plans of Darius for subjugating Greece.  Xerxes desires to avenge his father's defeat.  War continued by troops which Xerxes left behind.	(1) Mardonius.  (1) Datis, Artaphernes. (2) Miltiades. (3) Xerxes. (2) Leonidas, Eurybiades, Themistocles. (2) Pausanias, Aristides.	(1) 300 ships lost by storm off Mt. Athos.  (1) Naos, Eretria. (2) Marathon (490). (1) Thermopylae, Artemisium, Athens burned. (2) Salamis, sea battle. (2) Plataea, Myrae.	Partial success against Macedonians and Thracians.  The Athenians are victorious and the Persians retreat to Asia Minor. Xerxes retreats to Persia after his defeat at Salamis. All Persian invasions and attempts to subjugate Greece cease.
<b>6. THIRD MESSENIAN WAR—</b> 464-456 B.C. (1) Helots of Messenian descent vs. (2) Spartans.	Confusion following earthquake gives Helots courage to revolt.		(2) Mt. Ithome besieged. Spartans sent home for Athenian allies.	Messenians capitulate and are allowed to leave the Peloponnese never to return. Athens retains by settling them at Naupactus.
<b>7. PELOPONNESIAN WAR—</b> 431-404 B.C. (1) Sparta and Allies vs. (2) Athens and Allies. a. First Period—431-421 B.C. b. Second Period or Decelean War—413-404 B.C.	Envy of Sparta and her allies at Athens' growing power and influence. Discontent among some of the Athenian subject states.  Sparta takes advantage of Athens' weakness, resulting from the failure of the expedition to Syracuse, to renew the war.	(1) Archidamus, Agis, Brasidas. (2) Demosthenes, Cleon, Nicias.  Alcibiades serves Athens, Sparta and Athens in turn. (1) Lyander. (2) Conon.  (1) M. Menellus, Capitolinus, Camillus.	(1) Invasion of Attica, Plague in Siege of Plataea, Deilium, Amphipolis. (2) Peloponnesus, Sicily. (1) Decelia occupied, Attica ravaged. Many subject states of Athens revolt. Nicias, Epistolaus, Sarrander of Athens. (2) Abydos, Cyrcus, Arginon. (1) Battle of the Allia, Sack of Rome.	By the peace of Nicias (421) both sides are to restore conquests and prisoners but terms are imperfectly carried out.  The Spartans tear down the walls of Piræus and Athens. Athens loses her foreign possessions and fleet but becomes an independent ally of Sparta. Sparta is now supreme in Greece.
<b>8. GAULS' INVASION OF ITALY—</b> 390 B.C. (1) Gauls vs. (2) Romans.	Roman people refuse to surrender Roman ambassadors who had sided the Etruscans against the Gauls.			Gauls retire on payment of ransom. The overthrow of Rome had no permanent effect on her fortunes.
<b>9. SECOND SACRED WAR—</b> 357-346 B.C. (1) Phocians vs. (2) Amphictyons.	Phocians seize and plunder Delphi because of fine imposed by Amphictyonic Council.	(1) Onomarchus. (2) Philip of Macedonia.		Thesbans and Thessalians invite aid of Philip against Phocians and so takes their place in the Amphictyonic Council.
<b>10. THIRD SACRED WAR—</b> 335-335 B.C. (1) Macedonians vs. (2) Athenians, Thebans.	Amphictyons call in Philip to punish Amphians, whereupon he seizes Elateia, thereby threatening Athens. Athenians aroused by Demosthenes.	(1) Philip of Macedonia.	(1) Cheronnea.	Philip gains leadership of Greece. Hellenisth Greece is under the control of Macedonia.
<b>11. SAMNITE WARS—</b> 343-290 B.C. (1) Romans vs. (2) Samnites. a. First Samnite War—343-341 B.C. b. Second or Great Samnite War—327-304 B.C. c. Third Samnite War—298-290 B.C.	A dual between two rival races for supremacy in Italy. Campanians implore aid of Romans against Samnites who are laying waste their territories in revenge for aid given the Salerni of Tarentum. The occupation of Palearopolis by the Samnites. In all the Italian cities joined in the war against Rome. While Romans are engaged with the Gauls the Samnites enter Lucania and refuse to withdraw.	(1) Marcus Valerius Corvus, P. Decius Mus (son). (1) Papirius Cursor. (2) Fabius Italianus, Gavius Pontius. (1) Q. Fabius Rullianus, P. Decius Mus (son). (2) Gellius Egnatius, Cereus Pontius. (1) Alexander the Great, Nearchus. (2) Darius III., Memnon.		Capua is retained by the Romans and Tarentum surrendered to Samnites.
<b>12. WARS OF ALEXANDER THE GREAT IN ASIA—</b> 334-323 B.C. (1) Greeks vs. (2) Persians, Egyptians, Bactrians, Indians.	A war of conquest, a scientific expedition and a journey of discovery.		(1) Alexander the Great, Nearchus. (2) Darius III., Memnon.	Alexander conquers Asia from the Mediterranean Sea to the Indus R. and from the Arabian Sea to the Jaxartes R. and begins the Hellenization of the East. Founda Alexandria in Egypt. The empire breaks up after Alexander's death 323.
<b>13. ROMAN WAR WITH TARENTUM AND EPIRUS—</b> 282-272 B.C. (1) Romans vs. (2) Tarentum and King Pyrrhus.	The people of Tarentum capture Roman ships and insult Roman embassy. They call in King Pyrrhus of Epirus.	(1) Manius Curius Pyrrhus.	(1) Beneventum, Tarentum. (2) Heraclea, Asculum.	Pyrrhus returns to Epirus and his allies one by one submit to Rome, which is left supreme from Straits of Messina to the River Arno and the headland of Ancona.
<b>14. FIRST PUNIC WAR—</b> 264-241 B.C. (1) Romans vs. (2) Carthaginians.	A struggle for supremacy in Sicily. Pretax, Campanian mercenaries, having seized Mesina, appeal to Rome for aid.	(1) C. Duilius M. Atilius Regulus, P. Claudius Pulcher, C. Lutatius Catulus. (2) Hamilcar Barca, Himilco, Hanno.	(1) Agrigentum, Mylae, Enomum, Paenorum, Egadine Islands. (2) Siege of Lilybaeum, Drepana.	Carthaginians surrender Sicily and pay a war indemnity. Carthage retains the Western Mediterranean and Rome is launched on her career of conquest.
<b>15. SECOND PUNIC WAR—</b> 218-201 B.C. (1) Romans vs. (2) Carthaginians.	A duel to the death between Hannibal's attacks on Saguntum in Spain.	(1) Q. Fabius Maximus Velleus, Publius Scipio, P. Cornelius Scipio Africanus, Hannibal. (2) T. Quinctius Flamininus, L. Sempronius Paulus. (2) Philip of Macedonia.	(1) Syracuse, Capua, Metaurus, Zama. (2) Trebia, Trasimene, Cannae.	Hannibal succumbs as a result of the battle of Zama. Carthage forced to give up Spain, to pay an annual tribute, to surrender her fleet, and to agree not to go to war without the permission of Rome.
<b>16. FOUR MACEDONIAN WARS—</b> 214-146 B.C. (1) Romans vs. (2) Greeks.	Alliance of Philip, King of Macedonia, with Carthage.		(1) Cynoscephalae, Pydna.	Macedonia becomes a Roman province.

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTENDERS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>17. THIRD PUNIC WAR—</b> 149-146 B.C. (1) Romans vs. (2) Carthaginians.	War of Carthage with Massinissa gives Rome the pretext for completing the destruction of Carthage.	(1) Scipio Aemilianus Africanus.	(1) Siege of Carthage.	Carthage destroyed. Most of her territory becomes a Roman province of Africa.
<b>18. JUGURTHINE WAR—</b> 111-105 B.C. (1) Romans vs. (2) Jugurtha of Numidia.	Jugurtha, disregarding intervention of Rome, captures Citra and massacres male population.	(1) C. Marius. (2) Jugurtha.	(1) Muthul, Citra.	Numidia divided. The war reveals the corruption and incapacity of the Senatorial government of Rome.
<b>19. MARSIAN OR SOCIAL WAR—90-88 B.C.</b> (1) Roman vs. (2) Italian Allies.	Italian soil (allies) are denied the right of Roman citizenship.	(1) C. Marius. Sulla.	(1) Asculum. Italians form a Federal republic, Italia, with capital at Corfinium.	Roman citizenship granted to all Italian residents.
<b>20. FIRST ROMAN CIVIL WAR—88-82 B.C.</b> (1) Optimates vs. (2) Democrats.	Reform measures of Sulpicius are carried by means of violence. Command of army of Asia is transferred from Sulla to Marius.	(1) Sulla, Pompey. (2) Marius, Cinna, Sertorius, Carbo.	(1) Sacriportus, Colline Gate, Sulla's proscription. (2) Marius's Reign of Terror.	Sulla is appointed dictator.
<b>21. THREE MITHRIDATIC WARS—88-63 B.C.</b> (1) Roman vs. (2) Pontians and Armenians.	Ambition of Mithridates VI. and Roman interference.	(1) Sulla, Lucius Pompey. (2) Mithridates (Pontus). Tigranus (Armenia). (3) Crassus, Pompey. (2) Spartacus.	(1) Cheronnea, Orchomenus, Gabra, Tigranocerta. (2) Massacre of Italians in Asia. (3) Siliurus. (2) Mt. Vesuvius.	Reorganization of the East. Pontus, Syria and Cilicia become Roman provinces. Revolt put down with cruelty, 6,000 crucified.
<b>22. GLADIATORIAL AND THIRD SERVILE WAR—73-71 B.C.</b> (1) Roman vs. (2) Sailed Gladiators and Slaves.	Uprising of a band of gladiators, escaped from Capua and joined by many slaves of southern Italy.	(1) Julius Caesar. (2) Verres, Cicerus, Ariovistus.	(1) Siege of Alesia.	Conquest and organization of Gaul by Caesar. Gauls Romanized; boundaries of the old world enlarged (Caesar's expedition to Britain 55-54 B. C.); means acquired for changing Rome into a monarchy. Caesar is appointed dictator for life. He is the founder of the new monarchy at Rome.
<b>23. GALIC WAR—55-51 B.C.</b> (1) Roman vs. (2) Tribes of Gaul.	Desire to extend the Roman empire.	(1) Caesar. (2) Pompey and his sons.	(1) "Crossing the Rubicon." Pharsalus, Thapsus, Munda.	Brutus and Cassius, defeated, commit suicide.
<b>24. SECOND ROMAN CIVIL WAR—49-31 B.C.</b> First period, 49-48 B.C. (1) Followers of Caesar (democrats) vs. (2) Followers of Pompey (republican aristocrats). Second period, 43-42 B.C. (1) Friends of Caesar (Second Triumvirate) vs. (2) Caesar's Assassins. Third period, 31-30 B.C. (1) Octavius vs. (2) Antony.	Struggle for mastery between Caesar, conqueror of Gaul, and Pompey, conqueror of the East. Assassination of Caesar, 44 B. C. A continued struggle for supreme power.	(1) Antony, Octavius, Lepidus. (2) Brutus, Cassius, Scato Pompey. (1) Octavius. (2) Antony, Cleopatra. (1) Titus, son of Emperor Vespasian.	(1) New proscription (Mark of Cicero). Philippi. (1) Actium.	Triumph of Octavius, grand nephew of Julius Caesar. End of the republic and beginning of the empire.
<b>25. JEWISH WAR—</b> A. D. 66-70. (1) Romans vs. (2) Jews.	Revolt of the Jews against Rome.	(1) Domitian, Trajan. (2) Decebalus.	(1) Siege of Jerusalem.	Destruction of Jerusalem and the temple.
<b>26. DACIAN WARS—86-90, 101-102, 105-107.</b> (1) Roman vs. (2) Dacians.	Rome desires to extend her conquests.	(1) Constantine. (2) Maximus, Maximinus, Licinius.	(1) Turin.	Dacia is made a Roman province. Roman conquest and empire reaches its highest point.
<b>27. CIVIL WARS OF THE ROMAN EMPIRE—193-284.</b>	Contests for the throne among rival generals (barrack emperors).	(1) Constantine. (2) Others: Augusti.	(1) Battle near Chalons (451). (2) Adrianople, Sack of Rome. Visigothic Kingdom of Tolosa (Toulouse), (415-507). Vandals settle in Africa (429-534). Carthage, (439). Burgundians occupy Rhone Valley (443). Angles, Saxons and Jutes invade England (449). Huns and Ostrogoths ravage Gaul. Huns destroy Aquilles and Venice founded (452). Vandals plunder Rome (455). Odoacer gains ascendancy in Rome. The fall of the Roman empire (476). Ostrogothic kingdom in Italy (493-555).	Reorganization of empire by Diocletian (284-305).
<b>28. WARS OF CONSTANTINE THE GREAT FOR THE EMPIRE—310-323.</b> (1) Constantine vs. (2) Others: Augusti.	Confusion following abdication of Diocletian.	(1) Constantine. (2) Others: Augusti.	(1) Battle near Chalons (451). (2) Adrianople, Sack of Rome. Visigothic Kingdom of Tolosa (Toulouse), (415-507). Vandals settle in Africa (429-534). Carthage, (439). Burgundians occupy Rhone Valley (443). Angles, Saxons and Jutes invade England (449). Huns and Ostrogoths ravage Gaul. Huns destroy Aquilles and Venice founded (452). Vandals plunder Rome (455). Odoacer gains ascendancy in Rome. The fall of the Roman empire (476). Ostrogothic kingdom in Italy (493-555).	Constantine becomes sole ruler of Roman empire. He redistricts the empire, moves the capital to Constantinople and recognizes Christianity.
<b>29. INVASION OF ROMAN EMPIRE BY NORTHERN BARBARIANS—375-493.</b> (1) Roman vs. (2) Teutonic and Hunic Teutonic Tribes; Visigoths, Vandals, Suevi, Franks, Burgundians, Ostrogoths, Alemanni, Jutes, Saxons, Angles, Lombards.	The Huns (Mongolians) press upon the Teutons, who are forced to seek new lands within the boundaries of the Roman empire.	(1) Valens, Stilicho Aetius, Leo (bishop of Rome) (2) Alaric, Wala (Visigoth); Genseric (Vandal); Hengist and Horsa (Saxons); Attila (Hun); Theodore the Great (Ostrogoth).	(1) Battle of Chalons (451). (2) Adrianople, Sack of Rome. Visigothic Kingdom of Tolosa (Toulouse), (415-507). Vandals settle in Africa (429-534). Carthage, (439). Burgundians occupy Rhone Valley (443). Angles, Saxons and Jutes invade England (449). Huns and Ostrogoths ravage Gaul. Huns destroy Aquilles and Venice founded (452). Vandals plunder Rome (455). Odoacer gains ascendancy in Rome. The fall of the Roman empire (476). Ostrogothic kingdom in Italy (493-555).	Overthrow of the Roman empire in the west, though it continued in the east until 1453. The blending of Roman and Teutonic elements under the influence of the Christian religion and what remained of classic civilization formed the civilisation of the middle ages.
<b>30. WARS OF JUSTINIAN.</b> (1) Eastern Empire vs.— 333-554. (2) Vandals in Africa and (3) Ostrogoths in Italy— 533-555.	Desire to restore west to eastern empire.	(1) Belisarius, Narces. (2) Vitiges, Totila.	(1) Battle of Taginae (552).	Destruction of Vandal power in Africa and of the Ostrogothic kingdom in Italy. Eusebius established at Ravenna.

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTENDANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>31. WARS OF THE FRANKS—486-514.</b> (1) Franks vs. (2) Neighboring Peoples.	Desire to extend the limits of Frankish territory and to ward off attacks from without.	(1) <b>Clotis (486-511), Charibert Marlot (514-515), Pepin the Short (751-768), Charlemagne (768-814).</b>	(1) <b>Solssons (486), Clotis conquers Alsace and becomes a Catholic (Christian (496), Battle of Tours (732), Conquest of Burgundy (534), Charlemagne conquers Lombards (774-778), Saxons (775-804), Bavarians (788), Avars (791), Northern Spain (795).</b>	Franks become leading power in the west and revive the western empire. (Christmas day, 800, Milton.)
<b>32. HEPTARCHIC WARS IN ENGLAND—588-828.</b>	Struggle for supremacy among the seven Teutonic kingdoms.	Elthelbert (Kent), Edwin (Northumbria), Offa (Mercia), Egbert (Wessex).	The supremacy was successively held by kings of Kent, Northumbria, Mercia, and Wessex. Naerfield (842), Ellandun (825).	"The indistinct noise of many battles and devastations of many kingdoms overrun and lost." (Milton.) All England at last united under Egbert, king of Wessex (802-837).
<b>33. NORTHMEN INVASIONS—ninth and tenth Centuries.</b> (1) Northmen vs. (2) People of Western and Southern Europe.	Opportunity for plunder and conquest and later the driving out of adventurous spirits by the organization of settled kingdoms in the north.	(1) <b>Hastings, Rolf, Sweyn, Canute.</b> (2) <b>Alfred (England), Otto (France).</b>	<i>In England.</i> Treaty of Wedmore. Massacre of Danes, (1002). <i>In France.</i> (2) Siege of Paris. Grant of Normandy to Rolf (977).	The Northmen are the last swarm of Teutonic conquerors. They readily assimilate civilization and infuse new energy into western Europe.
<b>34. SARACEN OR MOHAMMEDAN WARS—632-1492.</b>	Saracens are ambitious to found a world wide Mohammedan empire.	(1) <b>Omar, Amru, Hassan, Moza, Tarik, Abderrahman, Mohammed II, Abdallah.</b> (2) <b>Yasgerud (Persia), Leo the Isaurian, Charles Martel, Constantine, Paleologus, Ferdinand of Aragon.</b>	(1) <b>Yarmouk (Syria), Bosra, Jerusalem, Caesarea (Persia), Alexandria (Carthage), Xerex (Spain), Granada, Toledo.</b> (2) <b>Constantinople (710), Tours, Jerusalem, Las Navas de Tolosa (1212).</b> (3) <b>Constantinople (1453).</b> (2) <b>Granada (1492).</b>	The Saracens attempted to conquer and convert Europe at three different times between 710 and 1492. Their power began to wane from the latter date.
<b>35. NORMAN CONQUEST—1066.</b> (1) Normans vs. (2) English.	William, duke of Normandy wishes to increase his territory and his power.	(1) <b>William the Conqueror.</b> (2) <b>Harold, king of England.</b>	(1) <b>Hastings.</b>	The king received added power and a modified feudalism introduced into England. Southern Italy and Sicily were also conquered by bands of Normans in the eleventh century and the kingdom of Naples founded.
<b>36. CRUSADES—1096-1270.</b> (1) European Christians vs. (2) Turks and Moslems. First Crusade—1096-1099.  Second Crusade—1147-1149.  Third Crusade—1189-1192.  Fourth Crusade—1201-1204. (1) Crusaders vs. (2) Eastern Empire.  Children's Crusade (legendary)—1212.  Fifth Crusade—1228-1229.  Sixth Crusade—1248-1254.  Last, Seventh Crusade—1270-1291.	The appeal of the eastern emperor for aid, the desire to recover the Holy Sepulcher from the infidels, the love of adventure, and hope of gain.  The Conquest of Edessa by the Moslems threatens Jerusalem. Preaching of Saint Bernard. Capture of Jerusalem by Saladin.  Appeals of Innocent III. Through influence of the Venetians the Crusaders turn aside to attack Constantinople.  Ignorant enthusiasm aroused by visions and miraculous tales.  Vow of Frederick II. of Germany. He goes under pope's excommunication.  Louis IX. of France starts on a crusade via Egypt.  Louis IX. goes against Mohammedans of Tunis, Prince Edward of England to Syria.	(1) <b>Peter the Hermit, Geoffrey of Bouillon, Bohemond of Tarantum, Robert of Normandy.</b> (2) <b>Conrad III. of Germany, Louis VII. of France.</b> (3) <b>Richard I. of England, Philip Augustus of France, Frederick Barbarossa of Germany.</b> (2) <b>Saladin.</b> (1) <b>Dandolo, Doge of Venice, Baldwin of Flanders.</b>  A shepherd lad, Stephen of Vendome.  (1) <b>Frederick II.</b>  (1) <b>Louis IX., later St. Louis.</b> (1) <b>Louis IX., Prince Edward.</b>	(1) <b>Nicaea, Antioch, Jerusalem.</b>  Unsuccessful attack on Damascus.  (1) <b>Acre.</b>  (1) <b>Sack of Constantinople.</b>  Thousands of children, women and peasants march from France and Germany to the Mediterranean.  (1) <b>Damietta.</b> (2) <b>Expedition to Cairo.</b>  Death of Louis by the plague. (2) <b>Acre, last Christian stronghold in Syria, falls (1291).</b>  (1) <b>Milan (1167).</b> (2) <b>Legnano (1176).</b>	Jerusalem is subdued and a transjordanic Jerusalem is founded at Jerusalem.  Armies almost annihilated by hunger, disease and the enemy.  The Latin Christians secure by treaty the privilege of visiting the tomb of Christ for three years without molestation.  Division of eastern empire. The Venetians get the monopoly of trade and most of the islands and coast lands of the Aegean and Ionian seas. The remainder is erected into a feudal state, the Latin empire.  Only a small number return home; the others perish on the way or are sold into slavery by French merchants.  Frederick, by treaty with the sultan, secures a truce for ten years and the restoration of Bethlehem, Nazareth and Jerusalem to the Christians. Jerusalem is finally lost in 1244.  Louis is captured in battle and released on payment of heavy ransom and evacuation of Damietta. The results of the crusades were development of commerce, introduction of new customs, products and manufactures, increase in freedom of lower classes, especially townsmen, and the power of the crown.  By treaty of Constance (1183) the cities of Lombardy are recognised as practically self-governing republics, the barest overlordship remaining to the emperor.  The beginning of constitutional monarchy—henceforth the king is below the law, not above it.
<b>37. WAR OF THE EMPIRE vs. (2) Italian Communes—1158-1183.</b>	Frederick Barbarossa's attempt to restore imperial rights over the cities of Northern Italy.	(1) <b>Frederick I. Barbarossa.</b> (2) <b>Pope Alexander III.</b>	(1) <b>Milan (1167).</b> (2) <b>Legnano (1176).</b>	
<b>38. WARS OF THE BARONS IN ENGLAND—1215-1265.</b> (1) Barons vs. (2) Kings John and Henry III.	Misgovernment of John and Henry III.	(1) <b>Stephen Langton, Simon de Montfort.</b> (2) <b>King John, Prince Edward, later Edward I.</b>	(1) <b>Signing of Magna Charta.</b> (2) <b>Simon de Montfort's Parliament.</b> (2) <b>Everham.</b>	

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTENDERS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>39. HUNDRED YEARS' WAR</b> 1337-1453. (1) English vs. (2) French.	The conflict of interests of the French and English kings in Guenney, Flanders and Scotland. Edward III. advances claim by descent to the throne of France.	(1) Edward III. Edward the Black Prince, Prince Henry V. Duke of Bedford. (2) Du Guesclin, Charles V., Joan of Arc. (3) Leopold III. of Austria. (4) Arnold von Winkelried.	(1) Crécy, Calais, Poitiers, Peace of Brétigny, Agincourt. Treaty of Troyes. (2) Orléans (1429), Castillon (1453).	England loses all her land in France except Calais. During the earlier stage of this war about one-third of the population of western Europe perished from the Black Death.
<b>40. AUSTRO-SWISS WAR</b> —1315-1358. (1) House of Hapsburg vs. (2) Swiss Confederation.	Hapsburg assert feudal rights over the peasants of the Swiss cantons.	(1) Leopold III. of Austria. (2) Arnold von Winkelried.	(2) Morgarten, Sempach, Näfels.	Independence of Swiss secured.
<b>41. HUSSITE WAR</b> —1419-1436. (1) Bohemian followers of John Hus vs. (2) Catholic Europe.	Execution of John Hus, the Bohemian religious reformer by the council of Constance.	(1) Ziska, Procopius the Great. (2) Emperor Sigismund, Cardinal Cossat, Frederick of Brandenburg.	Revolt of Prague. Four crusades repulsed.	After the overthrow of the radical Hussites (Tabornites) by the conservative Hussites (Calistines) in the battle of Lipan a Catholic reaction set in which culminated in 1462 with the revocation of the compacts made by the Council of Basel with the Hussites.
<b>42. WARS OF THE ROSES</b> —1455-1485. (1) Yorkists (White Rose) vs. (2) Lancastrians (Red Rose).	Misgovernment under Henry VI. encourages Richard, duke of York, representing the second line of descent from Edward III., to claim the throne against Henry VII. (third line).	(1) Richard, duke of York, Edward IV. Richard III. (2) Duke of Somerset, Queen Margaret, Earl of Warwick ("King-maker"), first a Yorkist and then a Lancastrian. Henry VII.	(1) St. Albans, Northampton, Mortimer's Cross, Tewkesbury, Barnet, Tewkesbury. (2) Wakefield, Bosworth Field.	Henry Tudor (Lancastrian in the female line) secures throne as Henry VII. By his marriage with Elizabeth of York he unites the warring factions and establishes an almost despotic rule in England.
<b>43. WARS FOR CONTROL OF ITALY</b> —1494-1529. (1) French vs. (2) Spanish.	Conflicting claims to the throne of Naples and to the duchy of Milan.	(1) Charles VIII., Louis XII., Ferdinand I. ("Chevalier sans peur et sans reproche"), Francis I. (2) Ferdinand of Aragon, Charles V., duke of Bourbon, France. (3) Emperor Charles V., Duke Maurice of Saxony. (4) John Frederic, Elector of Saxony; Philip, Landgrave of Hesse.	Invasion of Italy by Charles VIII. (1494). League of Cambray (1508). Holy League (1511). (1) Marignano. (2) Pavia.	All the leading powers of western Europe were drawn into this struggle. By the peace of Cambray (1559) France renounced her claims to Italy. One effect of these wars was to tie the hands of Charles V., so as to prevent his putting down Lutheranism in Germany.
<b>44. SCHMALKALDIC WAR</b> —1546-1547. (1) Charles V. vs. (2) League of Schmalkalden.	Charles V. attempts to crush Protestantism in Germany.	(1) Emperor Charles V., Duke Maurice of Saxony. (2) John Frederic, Elector of Saxony; Philip, Landgrave of Hesse.	(1) Mühldorf. (2) Mecklin, Haarlem.	Protestantism temporarily crushed. Its recovery in 1555 was followed by the religious peace of Augsburg 1555.
<b>45. RELIGIOUS WARS IN FRANCE</b> —1562-1598. (1) Catholics vs. (2) Huguenots (Protestants).	Mansuete of Huguenots at Vassy is a signal for uprising.	(1) Duke of Guise, Henry III. (2) Catherine de Medici, Condé, Coligny, Henry of Navarre (Henry IV.).	(1) Massacre of St. Bartholomew (1572). (2) Siege of Paris, Ivry (1590). Henry of Navarre becomes a Catholic (1593). Riots of Image Breakers, Council of Blood. (1) Mechlin, Haarlem. (2) Brill, Siege of Leyden, "Spanish Fury" at Antwerp. Pacification of Ghent (1576). Union of Utrecht (1579). Declaration of Independence (1581). (1) Stralsund, Edict of Restitution, Breitenfeld, Lützen. (2) White Hill, Magdeburg, Nordlingen.	By the edict of Nantes (1598) the Huguenots are given equal political rights. By the Peace of Westphalia, 1648, the worship of La Rochelle and other strong places as cities of refuge.
<b>46. WAR OF LIBERATION IN THE NETHERLANDS</b> —1568-1648. (1) Spain vs. (2) Revolted provinces in the Netherlands.	Political and religious tyranny of Spain. Duke of Alva enforces the Inquisition.	(1) Duke of Alva, Alexander of Parma. (2) William of Orange, Jan van Olden, Barneveldt, Maurice of Nassau.	(1) Frederick, Elector Palatine, Mansfeld, Gustavus Adolphus, Sweden, Turenne and Condé (France). (2) Emperor Ferdinand II, Maximilian of Bavaria, Tilly, Wallenstein. (1) Charles I., Prince Rupert, Montrose. (2) Cromwell, Essex, Fairfax, Leslie.	By the Peace of Westphalia (1648) the independence of the seven northern provinces, the United Netherlands, is recognized. The ten southern provinces continue under Spanish rule until 1713.
<b>47. THIRTY YEARS' WAR</b> —1618-1648. (1) German Protestants and their allies, England, Holland, Sweden and France vs. (2) Imperial German Catholics and their allies, Spain, Italy.	Disputes over interpretation of peace of Augsburg (religious and political) disputes leading to the revolt of Bohemia. The war passes through four phases—(1) Bohemian-Palatinates, (2) Danish, (3) Swedish, (4) Swedish-French.	(1) Frederick, Elector Palatine, Mansfeld, Gustavus Adolphus, Sweden, Turenne and Condé (France). (2) Emperor Ferdinand II, Maximilian of Bavaria, Tilly, Wallenstein. (1) Charles I., Prince Rupert, Montrose. (2) Cromwell, Essex, Fairfax, Leslie.	(1) Frederick, Elector Palatine, Mansfeld, Gustavus Adolphus, Sweden, Turenne and Condé (France). (2) Emperor Ferdinand II, Maximilian of Bavaria, Tilly, Wallenstein. (1) Charles I., Prince Rupert, Montrose. (2) Cromwell, Essex, Fairfax, Leslie.	This war is closed by the peace of Westphalia. Since then the independence of the seven northern provinces, the United Netherlands, is recognized. The ten southern provinces continue under Spanish rule until 1713.
<b>48. CIVIL WAR IN ENGLAND</b> —1642-1649. (1) Royalists (Cavaliers) vs. (2) Parliamentarians (Roundheads) allied with Scots (to 1647).	Charles I. attempts to force a personal government on England. His disputes with Parliament covered (1) taxation, (2) privileges of Parliament, (3) religion, (4) control of the militia.	(1) Charles I., Prince Rupert, Montrose. (2) Cromwell, Essex, Fairfax, Leslie.	(1) Marston Moor, Naseby, Preston.	The second civil war (1648) determines the army leaders to bring Charles I. to trial and execution (1649). Commonwealth established without King or House of Lords but with Oliver Cromwell as Protector (1653 to 1659). The son of Charles I. restored in 1660 as Charles II.
<b>49. FIRST THREE WARS OF LOUIS XIV.</b> —1667-1707. (1) France vs. (2) a. Spanish Netherlands. b. Dutch republic. c. Grand Alliance (German states, England, Holland).	Louis XIV.'s passion for fame and desire to increase French territory in Europe.	(1) Turenne, Condé, Luxembourg. (2) William III., De Ruyter.	Chambers of Reunion. (1) Ravaging of Flanders, Steenkerke, Neerwinden. (2) Saabach, La Hogue, Namur.	Extension of boundaries of France to the northeast.
<b>50. SPANISH SUCCESSION</b> in America, QUEEN ANNE'S WAR—1701-1714. (1) France, Spain and Savoy vs. (2) Austria, England, Holland, Portugal, Savoy.	Acceptance by Louis XIV. of the bequest of the Spanish dominion to his grandson, Philip of Anjou. In violation of the partition treaty to which he had consented.	(1) Vendôme, Villars, Leopold of Deaulx. (2) Duke of Marlborough, Eugene of Savoy, Heilsnis.	(1) Gibraltar, Blenheim, Ramillies, Turin, Oudenarde, Malplaquet.	By the peace of Utrecht in 1713 and that of Rastadt in 1714 Spain and the Indies go to Philip of Anjou; Naples, Sicily, Sardinia and other Spanish Netherlands to the Austrians. England receives Newfoundland, Acadia and Hudson Bay Territory from France and Gibraltar from Spain.

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTES- TANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>51. NORTHERN WAR—1700-1721</b> (1) Sweden vs. Russia, Poland, Denmark, Saxony.	Peter the Great joins Poland, Denmark and Saxony for the purpose of despoiling Sweden, the first power of the north, of her Baltic ports.	(1) Charles XII. (2) Peter the Great (Russia), Augustus II. of Saxony.	(1) Invasion of Denmark. Narva, invasion of Saxony. (2) Pullava.	By the peace of Nystad (1721) Sweden cedes large territories to Russia. Russia takes the place of Sweden as the foremost power of the north.
<b>52. WAR OF THEAUSTRIAN SUCCESSION—1740-1748.</b> (1) Austria, supported by Hungary, Bohemia, England, Holland and Saxony vs. (2) Prussia, France, Spain, Bavaria.	When Maria Theresa succeeded her father, Charles IV. of Austria, Frederick the Great of Prussia seized Silesia, thus precipitating a struggle for Austrian territories.	(1) Maria Theresa, George II. of England. Charles of Lorraine. (2) Frederick the Great of Prussia, Emperor Charles VI, Schwernin.	(1) Mollwitz, Chotusitz, Prague, Fontenoy, Hohen- neuburg, Soor. Peace of Dresden.	By the treaty of Aix-la-Chapelle Silesia is secured to Prussia, which state now becomes a great European power. This war is one phase of the long rivalry between France and Great Britain for seapower and dominion in America and India.
<b>53. SEVEN YEARS' WAR, OR THIRD SILESIAN WAR: In America, FRENCH AND INDIAN WAR— 1750-1763.</b> (1) England, Prussia vs. France, Austria, Russia, Spain, Sweden.	At the death of Charles VI. of Austria the right of Maria Theresa to the throne is contested chiefly by Frederick the Great of Prussia who seizes Silesia. Maria Theresa wishes to regain Silesia. Hostilities between French and English America and India. George II's concern for his ancestral territory of Hanover.	(1) Frederick the Great, Duke of Cumberland. Wolfe (America). Robert Clive, (India). (2) Daun (Austria). Charles of Lorraine, Montcalm (America).	(1) Dresden, Rossbach, Leuthen, Zorndorf, Minden. Hohen, Hohenkrehen, Kunersdorf. In America: (1) Louisburg, Fort Du quesne, Quebec. In India: (1) Plassey, Wandewash.	The peace of Paris (1763) gives England, Canada, the supremacy in India and certain islands, especially in the West Indies. Prussia retains Silesia. This war really founded the British empire which is based on sea-power and colonial dominion.
<b>54. AMERICAN REVOLU- TIONARY WAR—1775-1783.</b> (1) English Colonies in America aided by France vs. (2) England.	The revolt of the colonies against England was caused by in- fringements upon what they considered their rights of govern- ment, especially local self government and taxation.	See page 135.	See page 135.	Recognition of the independence of the United States in the peace of Paris (1783). The Mississippi river becomes the western bound- ary of the United States.
<b>55. WARS OF THE FRENCH REVOLUTION—1792-1802.</b> (1) Revolutionary France vs. (2) Coalitions of England, Austria, Prussia, Holland, and Spain. The Empire, Russia. a. First Coalition— 1792-1797. b. Bonaparte's Egyptian Expedition—1798-1799.	Intrigues of ambition; horror of Europe at the execution of the king; French offer of aid to revolutionaries in other coun- tries.	(1) Dumouriez, Kellermann, Jourdan, Hoche, Fischberg, Na- poleon Bonaparte, Moreau. (2) Duke of Brunswick, Coburg, Charles of Austria. (1) Napoleon Bonaparte. (2) Nelson (England).	(1) Valmy, Occupation of Nice and Savoy, Jem- mapes, Execution of king (1793), Annexion of Belgium, Fleurus, Lodi, Siege of Mantua. (2) Maitin, Neerwinden, Kaiserslautern, Wurzburg. (1) Battle of the Pyra- mids. (2) Battle of the Nile at Aboukir, Arre. (1) Marengo, Hohenlin- den. Napoleon's passage of the Alps (Great St. Bernard). Novi. (1) Ulm, Austerlitz. (2) Tulaugur.	By peace of Campo Formio (1797) the French frontier is advanced to the Rhine. Venice is given to Austria and the Cisalpine and Ligurian republics founded in Italy under French control.
c. Second Coalition. —1799-1802.	The mistakes of the government of the Directory and the prestige of Nelson's victory enable Great Britain to form the Second Coalition.	(1) Napoleon, Jour- dan, Bernadotte, (2) Suvarov, Melas, Archduke John.	(1) Marengo, Hohenlin- den. Napoleon's passage of the Alps (Great St. Bernard). Novi. (1) Ulm, Austerlitz. (2) Tulaugur.	Nelson's victory removes a serious menace to British power in India, cuts off the French in Egypt and deprives France of communication with its best troops and ablest general.
<b>56. NAPOLEONIC WARS— 1802-1815.</b> (1) France under Napoleon vs. (2) European Powers led by England. a. Third Coalition—1805.  b. (Fourth) War with Prussia and Russia. —1806-1807.	Neither England nor France regarded the peace of Amiens as more than a truce. Among the many causes of friction leading to renewal of war chief place was given to England's refusal to restore Malta.	(1) Napoleon. (2) Nelson, Mack, Alexander I. (Russia), Kutsoff.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	The peace of Presburg ends the First Coalition. France and Austria. Much harsher terms are imposed on Austria. Peace of Lunéville with Austria (1801); peace of Amiens with England (1802); surrender of England's conquest except Malta. Ceylon; Malta to be restored to Knights of Malta. As a result of his brilliant successes Napoleon in 1802 becomes consul for life and in 1804 took the title emperor of the French. Confirmation of treaty of Campo Formio, with the recognition of Batavian, Helvetic, Cisalpine and Ligurian republics. By the treaties of Tilsit (1807) Russia recognizes Napoleon's relatives as kings of Naples, Holland and Westphalia and consents to the creation of the Confederation of the Rhine and the grand duchy of Warsaw under Napoleon's con- trol. Alexander and Napoleon combine to dominate Europe. Prussia cedes territories contain- ing half her population. French expelled from the peninsula.
c. Peninsular War— 1808-1814.	Rebellion of Spain against Joseph Bonaparte, whom Na- poleon had placed on the throne.	(1) Soult, Massena, (2) Duke of Wellington.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	Austria cedes 32,000 square miles of territory, containing 2½ million inhabitants. Less than 20,000 of the half million men in Napoleon's army recrossed the Russian frontier.
d. Fifth War with Aus- tria—1809.	Alexander's refusal to enforce Napoleon's continental sys- tem, and other causes of dispute.	(1) Napoleon. (2) Archduke Charles.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	Driven from Russia in 1812, from Prussia in 1813, Napoleon in 1814 was forced to surrender France itself. By the treaty of Fontenoy he was expelled from the island of Elba and an annual renewal of 2,000,000 francs.
e. Invasion of Russia— 1812.	The disastrous Russian cam- paign, together with the steady progress of the British in the peninsula war en- couraged the oppressed states of Germany to rise against Napoleon's tyranny, Prussia taking the lead.	(1) Napoleon, Ney, Marschall Ney, (2) Kutsoff, Barclay de Tolly. (1) Napoleon, Ney, Marschall Ney, (2) Frederick, Wil- liam III, Francis I., Alexander I., Schwarzenberg, Blücher, Bernadotte.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	Wounded in 1812, Napoleon in 1814 was forced to surrender France itself. By the treaty of Fontenoy he was expelled from the island of Elba and an annual renewal of 2,000,000 francs.
f. War of Liberation— 1813-1814.	Quarrels among the allies and disaffection of French with Louis XVIII. tempt Napoleon to return from Elba.	(1) Napoleon, Ney, (2) Wellington, Blücher.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	Wounded in 1812, Napoleon in 1814 was forced to surrender France itself. By the treaty of Fontenoy he was expelled from the island of Elba and an annual renewal of 2,000,000 francs.
g. Waterloo Campaign —1815.	Quarrels among the allies and disaffection of French with Louis XVIII. tempt Napoleon to return from Elba.	(1) Napoleon, Ney, (2) Wellington, Blücher.	(1) Corunna. (2) Talavera, Lines of Torres- Vedras, Albuera, Salamanca, Vittoria, Toulouse. (1) Aspern, Wagram. (1) Smolensk, Borodino. Burning of Moscow. Retreat from Moscow. Passage of the Beresina. (1) Lützen, Bautzen, Dresden. (2) Dennewitz, Leipzig. (Battle of the Nations). Allies enter Paris.	Wounded in 1812, Napoleon in 1814 was forced to surrender France itself. By the treaty of Fontenoy he was expelled from the island of Elba and an annual renewal of 2,000,000 francs.

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTENDANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>67. WAR OF 1812—1812-1814.</b> (1) United States vs. (2) Great Britain.	Controversies over aggression on neutral trade and British impressment of American seamen.	See page 138.	See page 138.	Peace of Ghent in 1814 led to the settlement of the northern boundary of the United States.
<b>68. WAR OF GRECIAN INDEPENDENCE—1821-1829.</b> (1) Greeks, aided by England, Russia and France vs. (2) Turks.	Revived feeling of Greek nationality, stimulated by a widespread secret society working for a restoration of a Greek empire at Constantinople.	(1) <i>Tyssilanti, Diebitsch (Russia), Kodrigion, (England), Byron, (England).</i> (2) Ibrahim, Pasha.	Massacre of Greeks at Chios (1) <i>Navarino, Adrianople.</i> (2) Missolonghi.	The treaty of Adrianople, 1829, compelled Turkey to acknowledge the independence of Greece, which chose as king the Bavarian prince Otto I.
<b>69. MEXICAN WAR—1846-1848.</b> (1) United States vs. (2) Mexico.	Boundary disputes occasioned by the annexation of Texas.	See page 140.	See page 140.	By the treaty of Guadalupe Hidalgo, Mexico gives up to the United States all territory north of the Rio Grande and Gila river, comprising Texas, New Mexico, California, Nevada, Utah, Arizona and part of Colorado and Wyoming.
<b>69. CRIMEAN WAR—1854-1856.</b> (1) Russia vs. (2) Turkey aided by Great Britain, France and Sardinia.	The question of the political status and future of the lands of the Turkish empire. Immediate cause, the claim of Russia to a protectorate over all Greek Christians living under the sultan's rule.	(1) <i>Meshchikov, Gortschakoff, Napoleon III, Garibaldi.</i> (2) Canrobert, Pelissier, (France), Raglan, Simpson (England).	(1) <i>Balaclava.</i> (2) Alma, Siege of Sebastopol, Inkermann.	In the peace of Paris (1856) Russia's claim to a protectorate is disallowed, the Danube is opened to navigation and the Black Sea is closed to war vessels of all powers.
<b>61. SEPOY MUTINY—1857-1858.</b> (1) Sepoys vs. (2) English.	Uneasiness created by the rapid progress of British ways and rule causes a revolt of native Sepoy troops of India. Immediate cause the rumor that cartridges furnished troops were greased with a mixture of hog and beef fat—the one animal an object of loathing to Mohammedans, the other of religious worship to the Hindus.	(1) <i>Nana Sahib.</i> (2) Nicholson, Havelock, Campbell.	Mutiny of Sepoys at Meerut. (1) <i>Massacre at Cawnpore.</i> (2) Delhi, Relief of Lucknow.	Following the suppression of the mutiny the charter of the East India company is revoked and India passes directly under the crown, a secretary of state for India being added to the British ministry.
<b>62. WAR OF ITALIAN LIBERATION—1848-1849.</b> (1) Sardinia-Piedmont and France vs. (2) Austria.	Since 1848 Sardinia-Piedmont had been the center of the movement for Italian unity. Following promises of aid from Napoleon III, Cavour traps Austria into declaring war over the question of disarmament.	(1) <i>Victor Emmanuel III, Garibaldi.</i> (2) Francis Joseph II, Gyulay.	(1) <i>Montebello, Magenta, Solferino.</i> Peace signed at Zurich, Nov. 10, 1859.	By this war Victor Emmanuel I, in 1860 Tuscany, Parma, Modena and the papal legations were added. In 1861 he gained Sicily and Naples, together with the title King of Italy. Venice followed as a result of alliance with Prussia in 1866 and the addition of Rome in 1871 completed the unification of Italy.
<b>63. AMERICAN CIVIL WAR—1861-1865.</b> (1) Federal Government of United States vs. (2) Southern Confederacy.	The election of Lincoln, which marked the triumph of the Free-Soil, Republican party, was made the pretext for secession and the formation of the Southern Confederacy. War followed upon the attempt of President Lincoln to supply Fort Sumter.	See page 141.	See page 141.	Resulted in the abolition of slavery and the preservation of the union.
<b>64. DANISH WAR—1864.</b> (1) Austria and Prussia vs. (2) Denmark.	Incorporation of the duchy of Schleswig with Denmark in violation of treaty of 1862.	(1) <i>Gahlenz (Aust), Prince Frederic Charles (Pruss.)</i> (2) Bismarck, Gortchakoff.	(1) <i>Invasion of Jutland</i> (2) <i>Storming of Düppel.</i>	Denmark gives up Schleswig-Holstein, which is jointly administered by Austria and Prussia.
<b>66. AUSTRO-PRUSSIAN WAR—1866.</b> Prussia with smaller North German States, and Italy vs. (2) Austria, Hanover, Saxony, and South German States.	Friction over Schleswig-Holstein enables Bismarck to force Austria into a war for supremacy in Germany.	(1) <i>William I., Prince Frederic Charles, Moltke, Victor Emmanuel.</i> (2) Benedek, Archduke Albert, Gahlenz, Prince Charles of Bavaria.	<i>In Bohemia:</i> (1) <i>Sadowa, Königgrätz or Sadowa.</i> <i>In the West:</i> (1) <i>Frankfurt, Sedan, Metz, Orléans, Capitulation of Paris.</i> <i>In Italy:</i> (1) <i>Custoza, Lissa.</i>	Closed with the peace of Prague, Aug. 23, 1866, which authorized the re-establishment of the federated German states, excluding Austria; Austria ceded Venice to Italy, and her rights in Schleswig-Holstein to Prussia. Hanover, Hesse, Nassau are also annexed to Prussia.
<b>66. FRANCO-PRUSSIAN WAR—1870-1871.</b> (1) France vs. (2) Prussia supported by German States including South.	Jealousy of France at Prussian gains and friction over Hohenzollern candidacy for the throne of Spain. Bismarck's falsification of the "Ems dispatch" tricked France into a declaration of war.	(1) <i>Napoleon, MacMahon, Bazaine.</i> (2) <i>William I., Moltke, Prince Frederic Charles, Crown Prince, Prince Frederic William.</i>	(1) <i>Saarlucken.</i> (2) <i>Weissenburg, Wörth, Vionville, Gravelotte, Sedan, Capitulation of Metz, Orléans, Capitulation of Paris.</i>	Closed in 1875 with the treaty of Versailles with the following result: (1) The Franco-Prussian power was destroyed; (2) the western frontier of Germany was reconstituted; (3) The German empire was established; (4) Germany acquired Alsace and Lorraine.
<b>67. RUSSO-TURKISH WAR—1877-1878.</b> (1) Russia vs. (2) Turkey.	Turkish misgovernment and revolts in her Christian subject provinces, which were barbarously put down ("Bulgarian atrocities") arouse all Europe but Russia alone declares war.	(1) <i>Grand Duke Nicholas, Gurka, Grand Duke Michael, Alexander II.</i> (2) <i>Suleiman Pasha, Duman Pasha, Mukhtar Pasha.</i>	(1) <i>Passages of the Danube at Shitova, Shipka Pass, Plevna, Storm of Kara.</i>	By the peace of San Stefano as revised in the congress of the powers at Berlin, Montenegro, Serbia and Rumania become independent; Bulgaria remains tributary but receives a Christian prince; Russia obtains large indemnity and part of Armenia and also Bessarabia.
<b>68. CHINESE-JAPANESE WAR—1894-1895.</b> (1) Japan vs. (2) China.	Rival claims to suzerainty over Korea.	(1) <i>Ito, Yamagata, Kuroki, Nogi, Yamaguchi.</i> (2) <i>Tao, Yeh, Wei.</i>	(1) <i>Yalu River, Port Arthur, Weihaiwei, Nanchang.</i>	Treaty of Shimonoseki, signed April 17, 1895, removed from China foreign influence; ceded Formosa and Pseudow to Japan; and awarded to the latter an indemnity of \$190,000,000.

## NOTABLE WARS OF HISTORY—Continued

NAME OF WAR, CONTENTANTS AND DATES	CAUSE OF CONFLICT	LEADERS	CHIEF BATTLES AND INCIDENTS	RESULTS AND COMMENTS
<b>69. SPANISH WAR—1898.</b> (1) United States vs. (2) Spain.	Interference of the United States on account of the insular warfare waged by Spain in an attempt to suppress Cuban independence.	See Spanish-American War, p. 144.	See p. 144.	By the treaty of Paris, Dec. 10, 1898, recognized the sovereignty of United States in Cuba, and ceded to this country the Philippines, Porto Rico and Guam, in consideration of \$20,000,000.
<b>70. SOUTH AFRICAN or BOER WAR—1899-1902.</b> (1) Great Britain vs. (2) Transvaal, Orange Free State.	Resistance by the Boers to the British form of government in the Transvaal.	(1) Sir George White Buller, Steiner, Roberts, Kitchener, French. (2) Cronje, Botha, De Wet, Delarey.	(1) Siege of Ladysmith, Paardeberg. (2) Colenso, Spion Kop, Vaal Krans, Magersfontein.	Boers surrendered May 31, 1902; are granted the right of self-government under British sovereignty, and united with other self-governing British colonies in South Africa in 1910, to form the Union of South Africa.
<b>71. RUSSO-JAPANESE WAR—1904-1905.</b> (1) Japan vs. (2) Russia.	Russian encroachments in Manchuria, and their fortification of Port Arthur.	(1) Togo, Kuroki, Oka, Nodsu, Oyama, Nagai. (2) Kuropatkin, Aleksei, Makarov, Stokelberg, Linievitch.	(1) Port Arthur and Chemulpo, Vladivostok, Yalu River, Dairen, Siege of Port Arthur, Mukden, Sea of Japan.	Closed Sept. 5, 1905, by treaty of Portsmouth by which Korea passes under control of Japan, China regains Manchuria, and Japan is granted important railroad rights.

## LANGUAGE

Language is the whole spoken and written body of words and methods of combining words used by a nation, a people, a race.

**Classification of Languages.**—The researches of philologists have resulted in the classification of the languages of the world into the following families and branches.

**The Indo-European or Aryan Family.**—This family is of greatest interest to us because our own tongue belongs to it, and the races speaking these languages are the foremost nations in the history of the world. They have produced the greatest and richest literatures; their languages have a great wealth of words; and because of these things philologists have made a more thorough study of these languages than of any other group, and a study of them is at the basis of our modern science of comparative philology. This family has eight branches.

**The Indian or Sanskrit Branch** has been used in India since 2000 B. C. or earlier. The oldest form is the Sanskrit, in which are written the Songs of the Veda. The Sanskrit, Prakrit, and Pali are now dead; the Hindi, Bengali, and Marathi are the modern representatives, and are spoken by 225,000,000 people.

**The Iranian Branch** occupies the great plateau of Iran and the valleys of the Euphrates and the Tigris. The dead dialects of this branch are the Old Persian, handed down to us in a few cuneiform inscriptions, and Zend, or Old Bactrian. The chief modern representatives are New Persian (in part), Kurdish, Baluchi, Afghan, and Ossetic.

**The Armenian Branch** consists of the living dialects of the Armenians, the written form of which has been changed little since the fifth century of our era. It is used by the people of the Caucasus and south of the Black Sea.

**The Greek Branch** comprises the ancient and modern Greek literary languages and dialects. Our own civilization owes much to the Greek language, since it was the means of transmitting to us the wonderful civilization of the ancient Greeks.

Much that is best in the literature, philosophy and art of modern Europe is due to Greek influence. The modern Greek is used in Greece, the Balkan states, Constantinople, along the coast of Asia Minor, Crete and Cyprus. It is the commercial language of the east Mediterranean.

**The Italic Branch** includes the ancient Latin, Umbrian, Sabellian, and Oscan, the Latin having in time entirely absorbed the other three. The Latin was the language of the Roman republic and empire and was used in western Europe and in the Mediterranean basin. In spite of the break-up of the Roman empire Latin continued to be the language of the literary and scholarly classes for many centuries. Even to-day the Catholic church uses Latin as its official language. With the coming of the barbarians the Latin was gradually modified and with it as a basis there were formed ultimately a number of new languages called Romance languages. They are Italian, French, Provençal, Spanish, Portuguese, Roumanian, and Rhaetian.

**The Celtic Branch** is more closely related to the Italic branch than to any of the other branches of the Indo-European family. At one time it was dominant in all of western Europe, but in the course of centuries it was gradually crowded toward the west and is now used only in the northwestern part of France and in the British Isles. There are two groups: (1) the Northern or Gaelic, including Irish, Gaelic or Scotch, and Manx, and (2) the Southern or Brittonic, including Welsh or Cymric, Cornish (extinct since the eighteenth century), and Armorican or Bas Breton in Brittany.

**The Slavonic or Slavo-Lettic Branch** is found in eastern Europe and has two groups: (1) the Slavic, to which belong the Russian, Bulgarian, Servian, Polish, and Bohemian; (2) the Lettic, comprising Lithuanian, Lettish, and Prussian (now extinct). This branch is spoken by about 150,000,000 people.

**The Germanic or Teutonic Branch** is divided into three groups: (1) the Gothic or East Germanic, (2) the Scandinavian

vian or North Germanic, (3) the West Germanic.

**The Italian Language** in its literary form was the old Tuscan dialect, and was given its literary preeminence through the writings of Dante, Petrarch and Boccaccio in the fourteenth century. Although the literary Italian is read and spoken by all the educated people of Italy there still remain numerous dialects throughout the peninsula, and it is impossible for a native of southern Italy to understand the dialect of northern Italy. The Italian is spoken in the various dialects by at least 35,000,000 of people in Italy, Sicily, Corsica, Sardinia, Malta, southern Switzerland, southwestern Austria, a small region in southeastern France, in Argentine Republic, Brazil, and the United States.

**The French Language** assumed something like definite form in the middle of the ninth century. There were various dialects in different parts of France, but soon two supplanted all others; the langue d'oïl, which was the language of the north of France, and the langue d'oc, the language of the south of France, which became the modern Provençal. These are thus named because the word "yes" was *oïl* and *oc* in northern and southern France respectively. The langue d'oïl had its origin in the dialect of Paris and the surrounding country, the Ile de France of Capetian times. Modern French was well formulated by the seventeenth century, and is known for its polish, clearness, conciseness, and logicalness. It has a rich literature and has been the diplomatic language of the world since the sixteenth century and is still largely used for that purpose. Outside of France the language is spoken in Belgium, western Germany, Switzerland, and eastern Canada, being used by about 37,000,000 people.

**The Provençal** takes its name from the region in which it originated, Provence, originally a Roman province. It was the language of the troubadours and the Albigenses and is still spoken by 8,000,000 people.

**The Spanish Language** arose in different dialects in the small states of the Iberian peninsula, but ultimately the Castilian dialect became the literary language. Spanish is very important, inasmuch as it is spoken by the people of Mexico, Central America, the southwestern part of the United States, all of South America except Brazil, many islands of the West Indies, and the Philippine Islands. In

all about 50,000,000 use the Spanish tongue; of these 20,000,000 live in Europe. **The Portuguese Language** resembles Spanish more than any other of the Romance languages. It is spoken in Portugal, the Spanish province of Galicia, the Cape Verde islands, Brazil, Portuguese Guinea, Angola, and Portuguese East Africa. In all between 15,000,000 and 20,000,000 people speak Portuguese.

**The Rumanian Language** is spoken by about 10,000,000 people in Rumania, southeastern Hungary, Bessarabia, Macedonia, Albania, Thessaly, Epirus, and Istria. The origin of the language dates back to the second century of our era, in which the Emperor Trajan conquered Dacia and colonised it with Romans.

**The Rhaetian Language** is spoken by about 100,000 people in the eastern part of Switzerland, especially in the canton Grisons.

**The Gothic Group** has long been extinct, and we know it largely through the work of Ulfilas, who in the fourth century of our era translated the bible for the Goths who lived in the Danube valley and north of the Black Sea. The language ceased to be used when the Gothic kingdoms fell, with one exception: a small remnant of the Goths found refuge in the Crimean peninsula and partially maintained their language until the eighteenth century.

**The Scandinavian Group** comprises four languages, Danish, Swedish, Norwegian and Icelandic. Until the eleventh century these languages differed very little from each other.

**The West Germanic Group** is the most widely spread of all the Teutonic languages and is divided into High German, Low German, and Anglo-Saxon or English. From earliest times there were several dialects of the German language, all having sprung originally from one common tongue. These dialects tended to increase in number and each had its own written form. From the configuration of Germany the various groups of languages take their name, High German from the upper, or higher, part of Germany and Low German from the coastal plain. The modern literary German originated in the fourteenth century. At that time the imperial chancery and many of the lesser courts in Germany adopted German for Latin as the official language. Naturally in the intercourse between the imperial and other courts the imperial dialect was adopted. The imperial dialect was, of course, that used by the local court of the emperors, who at that time were living at Prague. So a High German dialect (Franconian) became the *kandel-sprache* or official language of Germany. By the end of the fifteenth century this language was used not only for private correspondence but was used by some of the universities. Through the work of Luther this language was given its greatest impetus toward widespread usage. In his translation of the bible he used the language of the Saxon chancery because it was the most widely used dialect. The bible and Luther's numerous writings were read throughout Germany. Gradually one part of Germany after another adopted this as the written language. The German language is spoken by about 90,000,000 people in Germany, Switzerland, Austria, the United States, Brazil, Argentine republic, and in the German colonies. German is a very expressive and forceful language and its great writers and

thinkers have produced literary, philosophical, historical and scientific works which are unexcelled.

In the Netherlands a Low German dialect is the literary and official language, and is known to us as Dutch. About 5,500,000 speak this language. The Flemish, a language closely resembling the Dutch, is used in Belgium by about 3,000,000 Flemish people.

**The Anglo-Saxon, or English, Language** was introduced into the British Isles in the fifth century (A. D. 449) by Teutonic tribes—Angles, Saxons and Jutes—coming over from the Danish peninsula and northwest Germany. One of the most striking features of the English language is its composite nature; no other language is made up of such diverse elements. The English have been the greatest word-borrowers of all nations. When the Anglo-Saxons came to England they adopted some of the expressions of the Celts whom they conquered. In the sixth century, when England was opened up to the Roman Catholic church, various Latin words were introduced. During the ninth and tenth centuries, while the Danes controlled England, and afterward, many Scandinavian words were brought into the language. The Norman conquest (1066) caused the introduction of the great bulk of the French element, which of course was originally Latin. The era of the crusades brought in several Arabic words. The trade and maritime relations with Holland caused Dutch words to be introduced. The Renaissance added many Italian words. Many literary and scientific terms were borrowed from the Greek, especially since the sixteenth century. All the countries and peoples with whom the English had any political or commercial relations in modern times were made to contribute to the English vocabulary—French, Spanish, Portuguese, Germans, Persians, Chinese, Russians, Malays, Tartars, Hindus, American Indians, and Australian aborigines. Because of this cosmopolitan character of our language it contains more words than any other language, variously estimated at from 150,000 to 300,000. English is spoken by about 150,000,000 people in the British Isles, the United States, Canada, Australia, New Zealand, South Africa, and extensively in all the dependencies of England, such as Egypt and India. English is the commercial language of a large part of the world to-day and its influence in this field is steadily growing.

**The Semitic Family.**—This is second in importance because some of the Semitic people (Hebrews, Phenicians, Carthaginians, Assyrians, and Arabs) have played very prominent parts in the world's religious and commercial history and have made great literary contributions. It has two groups: (1). The northern group comprises the Assyrian and Babylonian, known to us through cuneiform tablets, Hebrew, Samaritan, Phenician, Punic or Carthaginian, Chaldean, and Aramaic or Syriac. All of these are now practically extinct, Hebrew being used to a large extent for religious purposes. The Old Testament of the Hebrew is of great importance to us because on it our religion is partly based. (2). The southern group comprises Arabic and numerous dialects of little importance. The Arabic was the language of Mohammed and is now used, for religious purposes at least, in all the Mohammedan countries—northern Africa, including Egypt, all

of the Turkish empire, and by about 50,000,000 in India.

**The Hamitic Family** has been sometimes classed with the Semitic, but insufficient proof of its connection has been produced. It has three groups: (1) The Libyan or Berber in northern Africa; (2) the Ethiopian, spoken from the southern part of Egypt south to the equator, the most conspicuous members being the Galla and Somali; (3) the Egyptian, the hieroglyphic language found on the old Egyptian monuments and papyrus remains. It had a modern representative, the Coptic, which, however, was overpowered by the Mohammedan conquest.

**The Ural-Altaic or Scythian Family**, like the Indo-European, is found in Europe and Asia, and has five branches. (1) The Finno-Hungarian is spoken by the Finns, Lapps, and Hungarians or Magyars. (2) The Samoyed is spoken in the northern part of Russia and Siberia, there being five dialects. (3)

The Turkish is spoken from Turkey in Europe, with its capital at Constantinople, to the Lena. (4) The Mongolian is spoken still farther east but does not reach to the Pacific. (5) The Tungusic is spoken by the Tunguses and Manchus in the north-eastern part of Asia. The grammar of this family is very simple; each word has an unchangeable root and one or more suffixes are attached, making it an agglutinative language. The western branches have a resemblance to the Indo-European family.

**The Monosyllabic Languages of Southeastern Asia (Indo-Chinese).**—Here belong Chinese with all its dialects, Siamese, Burmese, Tibetan, and all the Himalayan dialects. These languages consist entirely of monosyllables which can undergo no change. Each word or root can have the properties of various parts of speech according to its position in a sentence. The most important of all of these languages is the Chinese, it being the greatest in the world. The number of people speaking it is variously estimated at from 270,000,000 to 433,000,000.

**The Malay-Polynesian Family** is found in the Indian Archipelago and in Asia in the Pacific and Indian Oceans. It has three divisions: (1) The Malayan division is spoken on the islands extending from Formosa south to Australia and west to Madagascar, including Sumatra, Java, Borneo, the Philippine islands, the Celebes, the Molucces, Formosa and Madagascar. (2) The Melanesian division is spoken on the Solomon islands, the New Hebrides, and the Fiji Islands, and probably by the people of New Caledonia, the Marshall islands, and other small islands north and east of Australia. (3) The Polynesian division is spoken on New Zealand (Maori), the Samoan islands, the Tonga islands, the Marquesas islands, the Society islands, the Hawaiian islands, and Easter islands. These languages have a very simple structure, having many vowels and very few consonants. The Polynesian dialect is the simplest of the whole group.

**The Dravidian Family of Southern India and Ceylon** is spoken by 56,000,000 people and has no known relation to other languages. In the cultivated dialects the influence of the Sanskrit is very noticeable owing to geographical proximity.

**The Bantu Family** occupies the southern part of Africa from the equator south to Cape Colony, with the exception of a region almost coterminous with German Southwest Africa, which is occupied by Hotentots and Bushmen. This language has numerous dialects, and is characterised by its use of prefixes instead of suffixes.

**The Central African Languages.**—Between the Bantu family and the Sahara desert is a large group of dialects, numbering hundreds. These vary in structure, but philologists have not studied them sufficiently to come to any definite and satisfactory conclusions about them.

**The American Family** comprises the languages of the natives of North and South America, excepting the Eskimo language in the extreme north. There are over four hundred dialects altogether, the most important of which are the Athabaskan, the Algonquin, the Iroquois, the Shoshonean, the Siouan, and the Maya in North America; the Caribben, the Tupi, the Aymaran, and the Patagonian of South America. Whether these languages are derived from one original language is at the present time very doubtful.

**The Australian Family.**—In Australia and in Tasmania there are a number of related dialects which are rapidly becoming extinct. These languages have no importance except to the philologist.

**Isolated Languages.**—Besides these families of languages there is a considerable number of isolated languages. Such are the Basque in the Pyrenees mountains, the Etruscan (now extinct for 2,500 years) in Tuscany, some of the dialects of the Caucasus region, the Japanese and the Korean, the Eskimo language in the arctic region, and finally the clicking languages of the Hottentots and Bushmen in southern Africa, so-called because of the clicking sounds made by placing the tongue against the roof of the mouth and withdrawing it with a sucking action.

**Universal Languages.**—There have been over forty attempts to create a universal language which might serve as a means of communication for all peoples of the earth. Most of these attempts were made in the last fifty years. Those of greatest importance are: *Volapuk*, published in 1879 by Schlegel of Baden; the vocabulary, about one-third is of English origin, while the Latin and Romance languages furnish a fourth. The grammar is simplified to the utmost. *Esperanto*, published in 1887, by Zamenhof of Warsaw, latterly taken up for practical purposes in many countries, its use being promoted by special societies and periodicals. Its structure is so simple that the whole grammar can be completely mastered in an hour. There are no exceptions to the rules, perfect regularity being a leading feature of the language. The essential roots number only some 900, including grammatical inflexions, prefixes, and suffixes, and these are chosen from the principal European languages in such a way as to make them accessible to any person of ordinary education. *Ido*, a modification of Esperanto, published in 1907; and *Universal*, a very recent attempt of Molenaar of Bavaria.

**PRACTICAL ENGLISH.**—The word *English* as used above does not refer merely to English words. It concerns more than such questions as to whether this word or that is good English. It means the whole art of writing English for practical purposes, so far as that art is itself a practicable subject of study. It means not merely English, but the art of writing.

The art of writing has been studied systematically for two thousand years, and the principles laid down by Aristotle, after a careful inductive scrutiny of Greek authors, hold good for any language. They are psychological principles. They concern the nature of different audiences

and different situations, and the fundamental laws of appeal to all audiences and every situation.

Aristotle devotes a third of his rhetoric to a study of audiences. There is no more practical injunction to a writer than this: Know the man you are writing to. Adapt your discourse to him and to the situation he is now in. Books on rhetoric, if they mention this principle at all, are likely to defer it till they come to the subject of argument. We place it first. It will keep you from writing into the air.

Keeping this preliminary principle in mind, we may proceed to divide our subject into ten sections: (1) Structure of the composition as a whole; (2) Structure of the paragraph; (3) structure of the sentence; (4) diction, or the choice of words; (5) punctuation and capitals; (6) proof-reading; (7) argument and debate; (8) the forms of public speech; (9) journalism and short stories; (10) business English, especially business and social letters.

It will be observed that half of these topics deal with a great variety of particular situations—debates, after-dinner speeches, addresses, lectures, sermons, newspaper writing, short stories, advertisements, sales-letters, etc. The other and earlier half deal with principles which are applicable to all forms of writing, all audiences, all situations.

#### Structure of the Composition as a Whole.

No matter what the audience, or the situation, no piece of English is practically effective unless it has unity, coherence, emphasis, and proportion. These terms are formal and time-honored, but they are the summing up of centuries of practical experience.

**Unity** implies singleness of purpose. It rests on the fact that you can produce only one effect at a time. Don't scatter. Make your point. Stick to your subject. Learn to shut out half the things that occur to you. Don't divide the reader's attention. Don't let him wander away and forget you. It is now or never.

Conversely, don't omit the one thing that you really meant to say. It is not enough to avoid irrelevance; you must bring in all that is relevant. Every practical writer can remember the day when he used to fill paper with readable stuff, only to find—later on—that it was mostly not to the point, and that the thing which lay nearest to his heart didn't get written down at all.

**The Title.**—Choose your title and then narrow it to fit the situation. At this minute I am writing in my cabin in the woods, and the birds are filling the birches with melody. But can I write about "Birds"? No; nor about "North American Birds," nor "Michigan Birds," nor any other vast phase of a vaster subject. But just outside my window a Wilson thrush is repeating his liquid, mellow performance at intervals of exactly five seconds; and I might possibly manage an article on "Intervals of Song in the Thrushes of Northern Michigan."

**Outlines.**—If you would be certain of unity, make an outline. It may be a very simple affair, consisting of half a dozen items. But a careful scrutiny of it will tell you whether you are attempting too much, and whether all your items logically come under the title you have chosen. Unity consists in a vital relation between title and content. In the case of an argument the outline must be not a mere list of topics, but a list of statements. In those half-

dozen sentences you can read the whole theme in brief.

Never allow yourself to believe that you can't work from an outline. It is what all poor writers plead. The people who can't think till they have the pen in hand, and who then wander along after their own pens instead of guiding them—these are the people whose articles and letters are ineffective. Their stuff has no skeleton, no bones, no structure, no organic life. Make your work—not like an anglerworm, that will live if you cut it in two. Make it like a human being. Make it as vitally organized as you yourself are.

**Coherence** means more than mere cohesion; it implies a living connection of parts. It implies such an arrangement as will enable the reader to follow the thought readily. It implies a normal order. For narration the normal order is that of time; events must be set down in the order in which they occur. For description it is that of the relative position of objects, grouping, contiguity, nearness and distance, etc. For exposition and argument it is the logical relation of fact and observation to conclusion. When the parts of a composition are thus set down in their normal order a sufficient degree of coherence is usually established for the simpler forms of writing.

In the more subtle forms, however, such as exposition, and especially argument, coherence will demand not only a normal order but also connecting links in the form of conjunctions, transition sentences, and sometimes transition paragraphs. Such terms as "moreover," "consequently," "however," "on the other hand," "in the next place," my "second contention is," etc., are of great value in articulating an explanation or an argument.

**Emphasis.**—There will be a gain in emphasis if, without violating the principle of coherence, the items of a composition can be so arranged as to bring the most important or most striking at the end. The reader is more likely to remember the theme as a whole if his final impression is a strong or vivid one.

But the opening words of a composition are as important as the closing. Get attention at the start. Strike out at once for some vivid interest of the reader—only let it be a legitimate and not a sensational interest.

**Scale.**—It is often necessary to bring what one has to say within a certain assigned limit of space. This will call into requisition the faculties of comprehensive view and judicious selection. Inexperienced writers usually say a great deal more than is necessary to an adequate presentation of the subject.

A good exercise for training in the matter of writing to scale is to reduce a paper of one thousand words to five or six hundred without sacrificing any essential point. A converse exercise is to treat a given topic in five hundred words, expand it to a thousand, and then to five thousand.

Writing to scale is one of the best exercises for the development of a logical and organized sense of composition.

**Proportion.**—A piece of writing that is well proportioned is one in which the various points are given space in accordance with their relative importance. Of course mere physical size or mere extent of theme has nothing to do with that importance. The valve gear of a locomotive will probably call for more space than the boiler. Similarly a certain half-hour of your outing

may call for more space than the entire work preceding.

Introductions and conclusions should, in general, be very brief. Your paper must not be top-heavy, nor must you keep on after you have really finished. For a theme of five hundred words, probably the first one or two sentences of the opening paragraph will constitute a sufficient introduction; for one of twelve hundred to two thousand words perhaps one or two paragraphs might be required; for a book of three or four hundred pages the opening chapter might be reserved for introduction.

As a practical method of securing a right proportion, the assigning of a numerical value to the various topics of the outline will be found helpful. It may prevent the young writer from expending too much energy and flow of speech upon the first few points, and then telescoping the rest as the task begins to wear upon him.

#### Structure of the Paragraph.—Definition.—

The paragraph is a modern device for avoiding an interminable sentence. In modern times a man could write a sentence of five hundred words, a sentence that would cover two pages of print, and go scot-free. Scholars would read it, and nobody else read anything in those days. Nowadays people wouldn't. But those old Latin-trained scholars were aiming at a large unit of thought. Often they indented before and after such a sentence to show that it was a unit. Now we keep the indentations, but we break the long unit up into several.

We state the topic briefly in one sentence. We are content to state it merely. Then we go on to illustrate it or defend it or amplify it. It may take three or four sentences to do this, but they will all be closely related. The group of sentences is unified by a single topic. The indentation is a halting-place that permits the reader to breathe, look back, and fix the paragraph in mind.

So remember that the paragraph is a device to give you time. Take your time. Don't be afraid of making a short sentence if the thought is really emphatic. Save your long sentence to mass details of illustration or proof.

**Unity in the Paragraph.**—Our definition indicates in general what we mean by paragraph unity. But a bit of caution must be added with respect to the word *topic*. The amateur is likely to think of every item or point as a topic, and to indent accordingly. The result is a rapid-fire series of pseudo-paragraphs of two or three lines each, disconcerting and often misleading to the reader. Paragraph unity involves the generalizing of points under a real topic of sufficient note to command a real paragraph, with bulk enough to constitute a real unit of thought, and not a mere fragment. Colonel Roosevelt, in a paragraph about two hundred words, deals with the following points: Premiums on meritorious conduct of policemen, a new system of pistol practice, the Bertillon system for identifying criminals, a police bicycle squad, and a new municipal lodging house. These points are all generalized, however, under the topic "Minor ways in which we seek to refine the police force," thus producing a logically unified paragraph.

**Paragraph Length.**—What we have said above has its bearing on paragraph length. By our definition a paragraph is a group of sentences. It should contain, as a rule, therefore, not less than three sentences of average length—twenty-five to thirty words each. This is the minimum.

Your shortest paragraph should contain ordinarily not less than seventy-five to a hundred words. The paragraph consisting of a single long involved sentence should be avoided. Break such a sentence up into three or four shorter ones.

As to its maximum, a paragraph, even when theoretically well unified, should not include much more than three or four hundred words. A paragraph running on through several pages of print has a discouraging look to most readers, and is likely to result in a hasty impression. The normal average should be about two hundred words.

In three exceptional cases the short single sentence paragraph is in place. The first is that of *dialogue*, in which, by more or less arbitrary usage, whatever is said by a single speaker at one time, together with identifying or brief explanatory remarks by the writer, is put into a paragraph by itself. The second case is that of *special emphasis*, wherein the moment or point is of such supreme importance as to be briefly paragraphed by itself, and thus visually emphasized in the printing by its contrast with the longer units before and after it. The writer should be very sparing, however, in such use of the short paragraph, as any approach to a frequent use will naturally defeat its own end—that of emphasis. The third case is that of the *transition paragraph*, which expresses a brief summary, or anticipation, or both.

The number of paragraphs in a composition bears no necessary relation to the number of topics or points in an outline. It is possible occasionally to develop a theme by assigning a paragraph to each point in the outline. It is more probable, however, that related points will have to be grouped into a single paragraph; and it may be that a single point will require two or three paragraphs for its development. This is in accordance with what we have said about paragraph length and unity.

**Coherence in the Paragraph** means simply that every sentence shall be in its normal place in the paragraph, and that whatever connectives may be necessary to a ready progress of one's thought through the paragraph shall be supplied. The reader resents being led astray, and being compelled to zigzag through a paragraph.

**Proportion in the Paragraph.**—This means precisely the same as proportion in the theme as a whole, except that the principle is applied on a smaller scale. The points or subtopics in a paragraph must be given space in accordance with their relative importance.

**Connection Between Paragraphs.**—In exposition and argument it is often desirable to indicate the relation of paragraph to paragraph. This may be done by the conjunction at the beginning of the following paragraph (e. g., "Moreover," "Beside," "As a result," "Notwithstanding," "Of no less importance," etc.). Or it may be done by the transition sentence, which is usually the first sentence of the following paragraph, although it may be found preferable sometimes to make it the last sentence of the preceding one. Or it may be done by the short transition paragraph. This last, however, is usually reserved for connecting one group of paragraphs with another group, rather than for connecting paragraph with paragraph.

#### Structure of the Sentence.—Definition.

The sentence is the fundamental unit of discourse. Hence the "sentence-sense," as

it is often called, the ability instantly to recognize a sentence when one sees it, is a fundamental necessity of accurate writing. A sentence is a statement, question, or command that is grammatically complete—one that contains a subject and a predicate expressed, and that is not introduced by a dependent or subordinating word. The only exception is the imperative form, in which the subject is usually implied.

The sentence may be very short. The following are complete sentences (the first three being in the imperative form): "Wait." "Don't." "Come here." "I can't." "You're quite right."

A mere phrase (prepositional, participial, infinitive, etc.), or a dependent clause, is not a sentence, and may not stand alone as such. The following are not sentences: "In a few minutes." "Frightened almost to death." "Being sure of my ground." "Now, to proceed with the argument." "At least not at present." "Although of course we can't be certain." "Not unless you are willing," which is quite a different story. It is a mark of slovenly style to leave such expressions as these straying about like lost dogs. They must be attached to something—to a main clause of some sort; e. g., "I can't answer all these letters, at least not at present." Of course in conversation such expressions are common enough, but the only right use of them in written discourse is in dialogue, when they represent what was actually said.

The converse error is that generally referred to as the comma blunder. Complete separate statements, and those closely connected in thought, must accordingly be separated by the period, the colon, or the semicolon, but less often by the comma, unless there is a real conjunction joining the statements. The greatest temptation to the comma blunder comes when the second statement begins with a personal pronoun (he, they, it, etc.) or a conjunctive adverb (then, therefore, etc.), or when there is a close relation of cause and effect, or of contrast, between the two statements. The following sentences are correctly punctuated: "Come on, laddie. It's time to go home." "Tom wasn't afraid. He was simply waiting for the right moment." "You'd better not try that bridge. It isn't safe." "He would not take the crown; therefore 'tis certain he was not ambitious." "Be sure you're right; then go ahead." "Be sure you're right, and then go ahead." Special care should be observed in the writing of dialogue to avoid the comma blunder.

The only exception to the rule here stated is the case of the series form, in which short statements are sometimes separated merely by the comma; e. g., "I have fought a good fight, I have finished my course, I have kept the faith."

**Agreement.**—Grammatical correctness requires an agreement or concord between certain parts of speech in the sentence. The commonest error is to confuse singular with plural. A verb must agree with its subject in number; both must be singular, or both plural.

The writer is sometimes misled in this matter when the subject comes before the verb. Notice the following: "Here were located the banking facilities of the colonies" (not *was*). "Coupled with the demand for the teaching of patriotism have come suggestions as to what course such instruction should take" (not *has*). "There exist in the minds of many people certain

prejudices against the foreigner." (Not *crias*).

Subjects joined by *and* commonly require a plural verb; e.g., "There are my friend Barton and his wife coming toward us." (Not *there is or there's*.) "There are in this room a table, three or four chairs, and a small stove." (Not *is*.)

A plural noun connected between subject and verb sometimes misleads the writer: "The sound of his steps was gradually lost." "The size of the plates agrees with the current capacity of the battery."

A collective noun is to be construed as singular or plural according as its parts are thought of separately or in the mass: "The crowd were throwing up their hats and shouting with excitement." "The crowd was headed by McAndrews, who was carrying a red flag."

The pronoun must agree with its antecedent in number: "The negro did not ask for the suffrage; but the responsibility involved in it has been good for him." (Not *them*.) "The drill press is a very useful machine. *It* is made in various forms and sizes." (Or, drill presses are made; not *They* are made.) The indefinite pronouns, *each*, *everybody*, *any one*, *a person*, *one*, etc., are singular, and should be so construed: "A person must have plenty of time if he is to do good work." (Not if *they* are.) "England expects every man to do his duty." (Not *them*.)

The same is true of the correlatives *either*—*or*, *neither*—*nor* when they connect singular nouns: "Either Arch street or Bond street is to be paved at once." "Neither your assumption nor your conclusion is justified."

Certain miscellaneous cases of agreement may be noted: "All the printers were attired in *crack suits*." (Not *a crack suit*.) A student writes, "The faces of both Goldsmith and Johnson are disfigured." He should say: "The face of Goldsmith was disfigured, and so was that of Johnson." Again: "There were two stained glass windows on both sides of the entrance." This is ambiguous. The writer means either "A window to each side or two windows to each side."

**Goverment.**—Certain cautions must be observed in the use of nominative and objective. After *it* and *us* we must have the nominative forms of the pronoun: "Is it *I* whom you mean?" "I believe it is *they*." "Wasn't it *she* whom we met at Newport?" Do not use the objective form of the pronoun for the nominative, or the nominative form in place of the objective. "We boys are going to the circus." "Uncle is going to take us boys to the circus." The same holds true when two pronouns are joined by *and*: "He and I were asked to report on the power loom." "The instructor asked him and me to report on the power loom." "Mr. Barlow invited Frank and me to be present at the recital." "Between you and me, I think he will bear watching."

Who and whom follow the same rule as any other pronoun: "I can't remember who it was." "If *who* was present at the reception?" "Whom are you looking for?" "For whom are you looking?" "He is a man who, I believe, is well qualified for the position." "He is a man whom I believe to be well qualified for the position."

In this connection may be noticed the correct use of verb tenses. The confusion of present, past, and perfect tenses is unpardonable. We need only mention such horrible examples as, "He come up and introduced himself to me." "I think

he has went out to lunch." "The water was froze solid." "I seen at once that there was no hope."

The forms of *lie* and *lay* are as follows:

Present	Past	Past Participle	Present Participle
lie (lies)	lay	lain	lying
lay (lays)	laid	laid	laying

Notice the following sentences: "I usually lie down for a little nap after dinner." "Just as I lay down yesterday, Dr. Harmon called." "The leaves have been lying on the lawn for some days." "Lay your books on the shelf, and let them lie there." Less obvious are certain inaccuracies in the use of the perfect tenses. In general, whatever goes back of the main verb should be stated in the pluperfect tense: "I often wish I had been born in the country." (Not *was born*.) "Men and women who had been shut up all day in the houses and shops came out to get a little fresh air." (Not *were* shut up.)

**Unity.**—Unity in the sentence means on a smaller scale the same thing as unity in the theme and in the paragraph. The sentence must be about one principal thing. The does not imply that all sentences must be short: a very short sentence may be lacking in unity, while a very long one may be perfectly unified. "Peter Cooper founded Cooper Union, and his father made hats." Here is a sentence of only ten words, stating only two facts about Cooper, but the facts are so distinctly related that they do not belong in the same sentence. Now take a longer sentence: "The road winds along by the river bank, and affords a glimpse of the stream now and then; and it is a shady, quiet road; but once in a while there is a clearing, and there the sun is very bright and warm." Here are five facts about the road; but they are so stated that not one of them stands out as the unifying fact.

Such a sentence may either be broken up into two or three shorter ones, or some of the facts may be subordinated by the use of other connectives besides the over-worked *and*. Both methods might easily be applied to this sentence, and we should get something like this: "It is a shady, quiet road, winding along by the river bank, and affording a glimpse of the stream now and then; once in a while, however, there is a clearing, where the sun is bright and warm." A mastery of the principle of subordination, and of the various subordinating connectives, is more than half the battle for sentence unity.

Converse to the example just cited is the practice of writing a sentence in several separate fragments, when they really belong together: "We came to a path. It led off from the wagon road. It led through the woods. The path apparently was not much used. It was a narrow path." It should read somewhat as follows: "We came to a narrow path, apparently not much used, that led off from the wagon road through the woods."

**Coherence.**—So far as this principle applies to the sentence, it means that the parts should stand in a normal position. The subject must not be very far removed from the verb; modifiers must be reasonably close to the parts they modify; the reader must not be zigzagged through the sentence in a disconcerting way. A few examples will make the principle clear. The period should be inserted where indicated by the circled 1. "Last week I, with an old friend of my father's, took a trip to New York City." If a workman

is honest, he usually is repaid for his honesty." "Of course every body can't become the head of a great business concern." "I lived in the small western town in which I was born, for about three years." "While I was in New Mexico, I remember that I had a burro, which I rode every day." "The account was confirmed by Colonel Shackleton, who some years ago headed an exploration party to the far south, to-day." "In front of the stores, different kinds of electric lights hang." "His hat had a narrow black band around it, which had worn all summer."

A special case is that of condensed comparison, often attempted in such sentences as the following: "Every year was as bad if not worse than the year before." Such sentences are faulty in syntax as well as incoherent, and should be written as follows: "Every year was as bad as the year before, if not worse."

It is disconcerting to travel through a sentence like the following, with two *but's* in it: "Even in his letter to his wife, Macbeth shows that the temptation is strong, but he does not put it actually into words, but suggests that the third prophecy may come true." The second *but* of the sentence should read, "He does not, however, actually put it into words, but suggests," etc.

**Coordination.**—Parts of a sentence that are joined by coordinating conjunctions, such as *and*, *but*, or, should be similar in form: e. g., "This ordinance was passed by the village board May 13th last, and which is now in effect." This is bad form. Which after *and* must be elided, or else it must appear in the first part of the sentence. Either of the two following forms is correct: "This ordinance was passed by the village board May 13th last, and is now in effect." "We have here an ordinance which was passed by the village board May 13th last, and which is now in effect." Take another example: "Elaine's treatment of Lancelot shows not only how great her love was, but also that she was kind and gentle." It should read, "That she loved him greatly, or how kind and gentle she was," or that both clauses shall be introduced by *that*, or both by *how*. Again: "Finally the two friends parted, Savage going to the west of England, and Johnson remained in London." It should read, "Savage went," (with period after *parted*), or, "and Johnson remaining," so that both expressions shall be participial or gerund expressions. Again: "A protective tariff is laid not as a source of revenue, but to protect growing industries." It should read, "to produce a revenue," or, "as a protection for." Again: "The northern colonies produced wheat, corn, and potatoes; and in the southern, tobacco, and sugar." "During the war, Mr. Maki, both members active by writing, and the southern, tobacco, rice, and cotton."

A special case of faulty coordination is what is known as the false series. A true series requires that all the members be in the same grammatical form. One method of correcting a false series is to introduce another *and*, where indicated, for example, by the circled 1 in the following: "The men were at work making molds, Coeres, and fixing the cupola for the afternoon heat." "The sudden introduction of a large volume of water causes contraction, leakage, and necessitates rapid firing." "During the summer I got lost in a cornfield, got into two or three fights, and a few other disturbances." Another method is to supply such words as will make the three

members of similar construction; e.g., "The men were at work making molds, making cores, and fixing the cupola."

**Wordiness.**—In general all statements should be as brief as is consistent with clearness. The thought is often unnecessarily repeated in the words of a sentence; "to return again," "to try the attempt," "a fine-looking appearance," "during the meantime," "all the whole afternoon," etc. Such phrases should be condensed. Something more obvious, perhaps, is a certain loose extravagance of words resulting in a weak, spongy effect. The portions bracketed in the following should be excised: "It isn't right to lie to your employer in order [that you may be able] to go to the ball game." "You can see a number of fishermen fishing for [a species of fish known as the] black bass." "We drove along a beautiful road [which was] bordered by tall elms."

A careless writer will sometimes duplicate his constructions, especially his prepositions and conjunctions. The words bracketed in the following should be cut out: "The experience [of] which I am going to write about happened in my childhood." "It is argued that, because many children leave school at an early age, [that] their schooling should be such as will enable them to become good workmen."

A word may be said about repetition. There should be no awkward attempt to avoid repetition when it is necessary to clearness or effectiveness, but when neither of these ends is served the repetition becomes a burden. There is nothing gained by the presence of the bracketed words in the following: "Some of the lights were strung straight across the street, some [were strung] in a circle, and some [were strung] in arches." On the other hand, there is a distinct gain in force by the presence of those bracketed in the following: "I don't expect you to depend altogether on your notes, but [I do expect you] to study them." "If slavery is not wrong, nothing is [wrong]."

**Ellipsis.**—Words should not be omitted that are necessary to the grammatical or logical completeness of the statement. The verbal forms must be expressed whenever a change of construction makes it impossible for a single form to do double duty. Notice the forms supplied in brackets: "We rode back a great deal faster than we had [ridden] coming out." "Several proposals were received, but only one [was] considered." "All that Burns writes about is true; it has [taken place], and will again take place in the life of man." The same is true of the preposition: "We are not only prepared [for] but equal to the task." The article must be repeated when the nouns stand for distinct persons or things: "Thine is the kingdom, the power, and the glory." The sum and substance of the matter is this: "Goldsmith produced a descriptive poem, a novel, and a comedy that are among the best of their kind." "We think of Browning as a poet and as a philosopher." The must always be used before *United States*. Idiom requires the following: "All day," "all night," "all the morning," "all the afternoon," "all the evening," "all the week," "all the spring," "all the autumn (or fall)," "all summer," "all winter." An adverb should be inserted between *very* (or *too*) and the participle in *ed*: "very greatly pleased," "very well satisfied," "too highly delighted." That should not ordinarily be omitted from the indirect discourse construction: "It must be remembered [that] they had no difficulty in getting

the best education." Logical comparison requires insertions as follows: "The general appearance of the church is like [that of] most city churches." "His face has the appearance of [that of] a bright, hard-working young man." "Our basket-ball team ranks high compared with [those of] other schools." Correct syntax requires the following: "On the opposite shore from [that on] which the town is situated, you can see lofty hills."

**Reference.**—Pronouns and other reference words must be clear and explicit in their reference. The agreement of pronoun with antecedent has already been explained. A pronominal reference must not be ambiguous, as it is in the following: "Chesterfield had treated Johnson discourteously many years before when he had called on him." "The parasite lives on the host until all his energy is gone." "Duncan tells Macbeth that he intends to stay over night at his castle."

Reference must be explicit, and not merely implied: "There's no use writing to John; he won't answer it." Here it refers to the noun *letter* implied in the verb *writing*. Similarly we have sentences like the following: "He invited me to join him in a bear hunt, which I readily accepted." "True friendship is so rare that when you find one you cling to him like a drowning man to a straw. Sometimes the implied reference is in a noun: "The shore is very rocky at this point, and these rocks are broken by the force of the waves." "The marquis taxes the people for everything; they use; this money he spends in banquets and suppers." Occasionally it is the adverb that is not explicit: "The increase of patriotism is due to school training; it is here that the child is first taught to love his flag." "He fainted, and remained so for some minutes."

The participial construction is often difficult to handle. There must be a real subject to which the participle can be logically and grammatically related. The misrelated participle is a mark of careless thought and careless writing: "On preparing to leave the next morning, the ax could not be found." Grammatically this means, "The ax, on preparing to leave, could not be found." Now, it is not the ax that is preparing to leave. The writer really means, "On preparing to leave, we could not find the ax." The same fault is apparent in the following: "Some time ago, while attending a debate, the negro question was discussed, upon the anchor the breeze carried us down to the far end of the lake." "After scarifying the two pieces of iron, they are heated to a high temperature." "Being a girl, he saw that she was afraid to protest."

In this connection we may notice what Professor Newcomer has called sins against *logic* or *method*. One or two examples will illustrate: "Honesty is the best policy in business as well as any other place." But *business* is not a place, and cannot logically be referred to as a place. The sentence should read: "as well as in any other calling, or occupation." Again: "The same thing is true of the doctor, the lawyer, or any other profession." Medicine and the law may be referred to as professions, but not doctor and lawyer.

**Idiom.**—The bulk of the English language is made up of Latin and of Saxon terms. In the dictionary there are more words of Latin origin than of Saxon, but in the usage of conversation and in the most enduring monuments of our literature the Saxon element prevails. In general the inexperienced

writer will do well to rely mainly on Saxon words. They are the words with which he is most familiar. They have the merits of naturalness, directness, simplicity, strength, and emotional coloring. They come from the heart, and life, and experience. On the other hand Latin words afford the advantages of formality, dignity, sonority, and a certain lofty and superior tone of discourse. They also offer a more exact and discriminating choice of terms than the Saxon, and hence constitute by preference the scientific and professional vocabulary.

**Good Usage.**—The choice of words implied in the term good usage is impossible of exact limitation. The best we can do is to indicate certain forms that are to be avoided, and generalize from the result. In ordinary written discourse, except realistic narrative, the following classes of words should be avoided: *localisms*, such as "pearl," "sun-up," "tuckered out," "right smart," "some chills," etc.; *euphemisms*, such as "ain't," "mighty be," "didn't ought," "complected," "most everybody," "ole man," "auto," etc.; *improprieties*, such as "leave us see," "the balance of the morning," "a man who is well posted," "an invite," "real pleasant," "a nearby house," etc., and slang terms, except in rare instances; *colloquialisms*, such as "up-to-date," "anyway," "quite warm," "right away," "handy," "a nice time," etc.; *technical terms*, except when one is writing for a special group of readers, such as "tort," "metabolism," "eidolon," "pony brake," "isothermic," "epicycloidal," "oxymoron," "oemoplasm," "rheostat," etc.; *pretentious and affected terms*, such as "fatic encounter," "consorial parlor," "eubinary department (for kitchen)," etc.; *foreign terms*, such as "de trop," "in de sabbat," "cuisine," "sub rosa," "nil admirari," "seitgeist," etc.

Apart from such cautions little can be said. The right choice of words is the ultimate test of one's place among the elect, and is a thing which only in its more obvious phases is subject to rule. It is to be acquired in its finer and more real quality only through wide and sympathetic contact with the masters of literature. (See Correct Use of Words.)

**Precision.** or discrimination between words of related meaning, can be acquired by scrupulous attention to definition and usage. Certain grosser faults, almost as much matters of spelling as of meaning, are involved in the confusion of the following: There, their; to, too; its, it's; then, than; loose, lose; led, lead; forth, fourth; principal, principle; quite, quick; effect, affect; except, accept; later, latter; cavalry, Calvary. The writer should, however, train himself in the finer distinctions, such as are involved in obtain, attain; secure, procure; survive, recover; apt, likely, liable; imaginary, imaginative; poetry, verse; fact, truth; democracy, republic; egoist, egotist; human, humane; effective, effectual, efficient; grief, grievance; act, action, activity; last, latest; education, schooling, culture; accurate, correct, exact, precise; start, begin; politic, political, etc. (See Multiple Dictionary, or books by Fernald, Fallows, or Rogee. See, also, Dictionary of Homonyms.)

**Idiom.**—Every language has its idioms—peculiar personal forms that are in a way the meat and kernel of it, and yet often illogical and not amenable to rules or principles. No one knows English who does not know its idioms, and yet few suggestions can be given as to how they can be learned. They must be acquired by con-

fact and absorption. The most we can here do is to indicate a few idiomatic expressions by way of illustration.

Much of our idiom centers about the proposition. The cars stop at Adams street, not on Adams street. The picture hangs on the wall, at the right hand end of it, to the left of the door. There is a window in the west wall, not on it. We have the privilege of hearing a noted speaker, not the privilege to hear him. We are under the necessity of cutting expenses. We go into the room, and move about in it. There is a fence in front of the house, and one back of it, or to the back of it, or behind it (not in back of it). We leave about nine o'clock, in the morning, not around nine o'clock, and there are about twenty of us in the party. We say seldom if ever, or seldom or never, but not seldom ever, or seldom or ever. Similarly we say seems to be, or looks as if, but not looks to be. We have confidence in a person, and confide a secret to him, because we have a high regard for him on account of our long intimacy with him. Your way may be different from mine, but is not necessarily better than mine. The student will have to master these and hundreds of others, each in its own special application. (See Dictionary of Prepositions.)

**Proof Reading.**—The correction of proof requires scrupulous attention to every unit of composition from the smallest to the largest. Corrections should be indicated in the margin, as nearly as possible opposite the mistake. When this is not possible a line should be drawn from the mistake to the correction. Mistakes are indicated on the page by underscoring, crossing out, drawing a vertical line through certain letters, drawing a line around certain words, and placing the caret where necessary. Corrections should be made neatly, and should be absolutely legible and unambiguous.

The signs commonly used in the correction of proof are the following:

✕ Change bad letter.	□ Move over.
➔ Push down space.	◻ Em quad space.
↶ Turn over.	
✕ Take out (delete).	⌄ One-em dash.
⋈ Left out; insert.	⌄ Two-em dash.
✕ Insert space.	¶ Paragraph.
✓ Even spacing.	
✕ Less space.	No ¶ No paragraph.
✕ Close up entirely.	w.f. Wrong font.
⊙ Period.	..... Let it stand.
✓ Comma.	stet. Let it stand.
⊙ Colon.	Tr. Transpose.
✓ Semicolon.	caps Capital letter.
✓ Apostrophe.	s. c. Small caps.
✓ Quotation.	s. c. Lower case or small letters.
✓ Hyphen.	Ital. Italics.
⌄ Straighten lines.	Rom. Roman.

**Punctuation and Capitals.**—The Period as indicating the end of a declarative statement has been already explained. It must also be placed after every abbreviation, and after Roman numerals. The Interrogation Point is placed after a direct question, or a part of a statement that is a question: "Where are you going?" "What about the boy?" is a question that is more and more demanding an adequate answer. It is used—but with doubtful propriety—in parentheses to indi-

cate doubt: "The patriotism (?) typified by the *Dreadnought* is much in evidence," etc.

The Exclamation Point is placed after words and phrases that are decidedly exclamatory in character: "Oh! look! They're being driven back." "Oh, if John were only here now!" The words Oh and O are interjections expressing strong feeling. O is used in direct address and in expressions of surprise, indignation, or regret, and should never be followed directly by the exclamation point, "O Thou Great Helper of the weak, give us now Thy strength."

The Comma is used (a) to set off clauses within the sentence, as "The way was long, and the wind was cold." "Not that I loved Caesar less, but that I loved Rome more." (b) The dependent clause is usually set off when it begins a sentence, and is also set off when it ends one, unless closely connected in sense with preceding clause; "When you are ready, say so." "Come to the tent when you are ready." "We were about to give up the search and start for home, when we heard a faint call in the distance." (c) The relative clause is set off when it is additional, but when it is restrictive: "This road, which is the old St. Louis trail, runs past our farm." "Our farm is on the road which is known as the old St. Louis trail." (d) The comma is used to separate the members of a true series: "Days, weeks, months passed slowly by." (e) The present tense, used in a line upon line; here a little, and there a little. "Society has to care for the pauper, the delinquent, and the defective." "For winter is past, the rain is over and gone; the flowers appear on the earth; the time of the singing of birds is come, and the turtle doth turn to his hole." Notice the comma before and in the last two quotations. The comma is used to separate two or more adjective or adverbial modifiers when they are not logically an integral part of the word they modify: "A tall, young, handsome fellow he was." "A tall, handsome young man." (f) The comma is used to set off vocatives, and introductory and more closely related parenthetical elements. "My gentle Puck, come hither." "What mercy can you render him, Antonio?" "Well, honor is the subject of my story." "There is, if I remember rightly, a spring near the shore." (g) The comma is used to set off an introductory adverbial it may be regarded as a preposition: "Beyond, the mountains rose in their strength and silence." "Beyond the mountains lies the land of our hope." The comma, as does punctuation in general, marks divisions in the grammatical construction, and it is used especially to prevent misunderstanding. It should not be overworked, and must not be used to show elocutionary pauses. A good elocutionist may make a pause, called the rhetorical pause, after any word of a sentence, if by so doing he can increase the impressiveness of his interpretation.

The Semicolon is often used to separate complete statements that are so closely related in thought as to make the period too much of a stop. It should not ordinarily be used to separate a dependent clause from the main clause. It is used before i. e., "that is," and e. g., "for example." The Colon is used to present formally all the marks of punctuation. It is used to separate statements that are set in formal apposition with each other, the second being a repetition or explanation or illustration of the first: "The engineer is supremely the man of scientific imagination; he must see the structure before he builds it." The

colon was formerly much used to separate the two parts of a long compound sentence, if the parts themselves contained semicolons; but the practice is not to be commended. It is used, also, to introduce a list, or a quotation formally stated: "We have to consider, therefore, the three following propositions: government ownership, government control, and private enterprise." Motion, on page 24, was as follows: "A foundation task of the artist, etc." The colon is also used after the salutation in a letter: "Gentlemen: Referring to yours of the 14th, etc." No dash need follow the colon after such a salutation.

The Dash is used informally, somewhat as the colon is used formally: "There is only one method left—concession." "There were only three of us present—Hayes, Carter, and I." The dash also indicates a sudden break in the thought: Now, the alibi strata—but of course that doesn't interest you." It is further used to set off a parenthesis more decided than those enclosed by commas: "And that was his last experience—and almost every one has had—will understand what I mean."

The Parentheses, or curves, are used to inclose a still more definite parenthesis, one that is often independent grammatically of the rest of the sentence: "Late that night (it was about eleven-thirty, as a matter of fact) I became aware that he (Stanley) was retaining consciousness."

The Quotation Marks are used to include quoted matter that is stated in direct form. A quotation within a quotation is indicated by single quotation marks. Notice the following, observing, also, the use and position of period, comma, apostrophe mark, and capital: "He hardly agrees with you in that matter," said David. "I don't suppose," remarked Anne, quietly, "that there is anything more to be said." "Come here, Silas," said Arden; "I want you to look at this letter." "Why do you ask me that?" inquired the grocer, "when I have a few minutes left," continued my father, "Dexter came up to me and said, 'What are you doing here?'" But note the absence of quotation marks in the following: The printer said that the bill would come to about twelve dollars.

The Apostrophe is used to indicate possession. For the singular we add 's: "Henry's watch," "Fisherman's luck," "Charles's ideas." The apostrophe without 's is permissible when the noun ends in s; e. g., "Charles's ideas," and must be used alone in such names as Cæsar's, Achilles's, Moses's, etc. For the plural we add the apostrophe when the noun ends in a and when it does not: "The boys' tasks," "The ladies' aid society." "A book of children's stories." The apostrophe is less frequently used to indicate the possessive of objects; as, "the length of the field," not "the field's length," etc. But we say, "A year's absence," "two weeks' vacation," "at arm's length," "the water's edge," "a day's wages," "a dollar's worth," etc. The apostrophe is also used to indicate omitted letters in contractions: Don't, hasn't, you're, o'clock, etc. The 's is used also to indicate the plural of letters and figures: "Three S's." "He doesn't make his letters." "He doesn't make his figures."

Capitals are used in general to distinguish personal or individual names from class names: David Farragut, Harlequin, Hamburg, Ceylon, American, etc. The words river, mountain, lake, street, building, etc., and official and professional titles are capitalized only when attached to proper

names: the Ohio River, Lake Erie, the Borland Block, the Hamilton Club, Central Park, Amherst College, Doctor McDonald, President Harper, etc. The following words are regularly capitalized: names of the Supreme Being; important words in the title of a book, article, etc.; historical epochs, wars, etc.; days of the week and months of the year (but not the seasons), holidays, holy days, etc.; abbreviations of title attached to proper names, and also A. D. and B. C.; the interjection O and the pronoun I; names of relationship when immediately preceding the name (e. g., Aunt Amanda, Brother Amos), and Father, when referring to any of the orthodox writers of the early Christian church (as, the Fathers); names of things personified, the first word of every independent sentence, and of every direct quotation (unless it is a phrase or fragment not in dialogue), the first word after a colon if it begins a letter or a formal quotation, and the first word of every line of poetry.

**Argument and Debate.**—The purpose of *argument* is to convince some one of the truth or falsity of a proposition—to make him agree with you in your view of the matter. To bring some one else to think as you do means that you must have good reasons for your own attitude and be able to present them in a convincing way. We have to consider, therefore, what constitutes a good reason.

(1) Practically all our reasoning falls under two broad general laws—those of induction and deduction. *Induction* is the primary form of reasoning; it means the drawing of a general conclusion from specific facts and observations. You decide, from certain facts, that a particular business firm is unfair or unreliable. It is apparent that the soundness of your conclusion will depend upon your getting at the real truth of the matter, and getting at it in a broad way.

*Direct evidence* is, on the whole, the best kind of proof. What you have yourself actually seen or experienced, may well be offered in support of your attitude. The experience of some one else may, however, be more convincing than your own, if he is a more practical observer or an authority. In citing authorities, it is absolutely essential to cite the best, those who are known to be accurate, truthful, unprejudiced, and thoroughly informed. Depend on weight of authorities, not on number. In offering examples to support a contention, you must remember that "one swallow does not make a summer," and that, similarly, one example does not prove a contention. In the same connection we may notice that, because one thing happens after some other thing, the first is not necessarily to be declared the cause of the second. We may be pretty certain that, if a field looks fresher after a rain, it is because of the rain; but we cannot be so sure that, if the wheat field is discovered ablaze after the train has just passed, it was the train that set it ablaze. A step further removed is the argument by *analogy*. The growth of the lily from the bulb is an argument for the immortality of the soul, though it is a very beautiful symbol of it. *Indirect evidence* is often very strong, as, to quote Thoreau, when you find a trout in the milk; but it is subject to the same allowances as direct evidence. The presence of a man at a horse race may indicate that he is interested in racing, but not that he is a gambler.

(2) The other general law of reasoning is that of *deduction*. It consists in the application to a specific case of a general

proposition that is already admitted. The general proposition (major premise), its application (minor premise), and the resulting conclusion, constitute what is known as the syllogism. Take an example: Governments derive their just powers from the consent of the governed; our government of the Philippines is without their consent; therefore it is unjust. It is obvious that you must be absolutely sure of your premises, or else your conclusion will be false. Practically every argument involves both the inductive and the deductive process.

(3) The presentation of arguments by speakers on both sides of a stated question constitutes a *debate*. The purpose of debate is, or ought to be, to get at the truth of the matter; and nothing can be more humiliating or demoralizing than the use of subterfuge, quibbling, rant, abuse, and intellectual trickery for the trivial satisfaction of beating one's opponents. The question chosen for debate should have two distinct sides to it. It should be stated affirmatively; e. g., Resolved that the United States is justified in her occupancy of the Philippines (not, is not justified). The question should be discussed, and so formulated that both sides understand exactly in what sense it is to be understood. Then the preparation of the debate should proceed. The affirmative should proportion the arguments among its speakers, and the negative among its speakers. Each speaker should then study his argument, formulate its terms, collect his material, and prepare his brief.

The brief is the most important step in the process. It consists of a statement of the points which the speaker proposes to make, arranged in a logical way as main points, minor topics and sub-topics. The order should be that of increasing importance, the weaker points coming first, and the stronger ones toward the end. All the points in the brief should be stated in the form of complete sentences. The speaker must prepare his refutation as well as his direct argument; that is, he must answer arguments that will be made, or might be made, on the other side. He will do well also to consult frequently with his colleagues to see that there are no overlappings or omissions. When the brief is completed, the argument should be written out in *extenso*, and absolutely mastered. It need not, and ordinarily should not be learned word for word. But the speaker must be sure of the exact phrasing of certain points, and must make certain that his transitions are easily apparent. In the delivery there should be no shouting, no striving for applause, no cheap allusion to the "ignorance and stupidity of our opponents." Speak calmly, naturally, firmly, quietly, and above all courteously.

**The Forms of Public Speech.**—We may distinguish the after-dinner speech, the address, the oration, the lecture, the sermon.

**The After-Dinner Speech** must be short and informal, yet it may be weighty. The greatest offense of after-dinner speeches is tediousness. One good story is better than half a dozen. The diction should be eminently simple; for it is the very essence of the social temper to avoid technicalities on the one hand and extravagance on the other. Simplicity, restraint, and understatement are marks of breeding. Yet an examination of five-minute addresses by such men as Lowell, Curtis, and Henry Grady shows that this tiny form of com-

position may express important thoughts: it can get down to fundamentals; it can set up noble ideals. It can be "built like a watch," obeying on its own scale all those rules of organization which have been previously set forth.

**The Address** is a dignified speech of considerable length and great variety of subject. In a recent collection of addresses we note such topics as the influence of universities, the leadership of educated men, the scholar in a republic, the drama in America, the child and the state, general amnesty, secession. The presidential address of a society usually sums up recent tendencies which interest the society, and then gives some outlook on the future. Such is Miss Jane Addams' address on "Charity and Social Justice," before the St. Louis Congress of Charities, 1910, an address marked by broad historical retrospect and a penetrating philosophic prospect. The tone, or degree of dignity, in the diction of an address must be high. Humor must be kept very subordinate, and colloquialisms must be rare. On the other hand, unnecessary technicalities must be avoided, and display must be entirely absent. Before a recent meeting of the American Philosophical association the "papers" were so technical that even the members wrangled for hours as to their meaning. But the presidential address, by the late William James, on "The Energies of Men," was given in language so picturesque and clear that it was sought by a popular magazine, and was quoted far and wide.

**The Oration** is an elaborate discourse, treating an important subject in an impressive manner. Its purpose is not primarily that of the address; it seeks sooner or later to move the listener to some definite action. For this reason it is commonly felt that an oration should not be read; it should seem impressively impassioned and extemporaneous. The very name suggests *oral*, and recalls the whole ancient tradition of *rhetoric*, or public speech. It recalls Aristotle, with his distinction between the oratory of deliberation and that of display. Ancient *epideictic* oratory permitted a certain amount of display and beauty for its own sake. The modern form of oration which still preserves this tradition is the *eulogy*. Blaine's eulogy upon Garfield is a striking example of the legitimate exercise of the power of pure oratory. One who listened to the nominating speeches in the Republican Convention of 1908 cannot help regretting that the power of dignified eulogy—eulogy which unites a significant man to the times of which he is the expression—is practically lost. But the loss has some compensations. It is almost wholly a gain that young men are now advised to study Wendell Phillips instead of Daniel Webster. The plain, direct, conversational style is far more effective to-day than the older decorative and rhetorical style.

The basis of every good oration must be good organization and sound argument. Beyond that, the most important thing is for the orator to know his audience, that he may appeal to their sympathy, and, if need be, to their selfishness. Remember that Aristotle, that great student of humanity, devoted a third of his treatise on oratory to the psychology of different audiences.

**Journalism. Short Stories.**—Perhaps the most valuable single gift to the journalist is the sense of mass and proportion. He must write accurately to space. He must

dwell on the significant, and boil the less important down to its lowest terms. Headlining is a science in itself, and keeps one man busy on every day, for it is the art of telling the whole story in a few phrases. As for diction, the trend of the times is toward simple words. It is only in rural districts that we find "fine writing," pretentious phraseology. Here it is often due to forcing an ignorant man to report something that he knows nothing about—as, for example, in this: "He has a pliable tenor of immense range, coupled with deep organ tones in his lower register. He will doubtless advance into deserved prominence in that mimic world which proves so fascinating to the actor and the singer." The day is passing when reporters talk about "infuriated animals" when they mean runaway horses. Headlining, however, has one bad effect on diction. It leads to the coining of short and ugly cant words, like *tail-feet*, to fit the exigencies of space. A sensible reporter avoids smartness in his diction; the people want the news, and not his verbal antics.

**Short Stories.**—The writing of short stories is an art which has grown with journalism and is closely allied to it. The short story finds its audience in the tired business men and the tired youths and maidens who shrink from prolonged dealings of mind with novels—especially the sociological novels of the day. This means that the short story must be so constructed as to capture weak attention. An allegory or a tale, however lovely, does not do that, because it lacks plot and surprise.

Plot and surprise, then, the short story must have. Its material may be realistic or romantic, but it must be worked up into a story. On the other hand, there can be no intricate and elaborate plot, for that takes up space and time. The problem is to get a surprising incident, a surprising turn of affairs, and lead up to it neatly and briefly. The events must not cover a long period; the past must be ruthlessly forsook; a single day, sometimes a single hour, must disclose the whole complication and resolution of the events. So, as Brander Mathews has put it, a short story is not merely an abridged novel.

Again, there is no opportunity for showing the development of character. If there is to be change of character in your hero, you must catch him at the moment before the change comes. Most short stories do not attempt character-change, but deal with incidents. Of course, the more significant the incident is, the better. The ideal thing would be to catch the most important day, hour, and incident in the hero's life.

A good beginning is half the battle for it gets you your reader. Make it fresh and striking. Roughly speaking, do not begin either with description or with dialogue. Votes have shown that both are less acceptable than a paragraph which flashes before you an intrinsically interesting person or a striking situation.

Avoid dialect: there is no sale for it now, except to a few magazines from a few masters.

Avoid unpleasant and ghostly and cynical and "suggestive" material. Pure love, heroism in daily life, friendship, loyalty, ludicrous happenings, fair and honorable getting on in the world; hope, poetic justice—these are the themes that sell. Be human and don't be trite, hackneyed, or commonplace.

Choose your title as carefully as if you were advertising.

Study your market—as in the book *1001 Places to Sell MS.* (Editor Co., Ridge-wood, N. J.)

**Sermons.**—A sermon is not a lecture, although preachers sometimes forget the fact. The primary business of a sermon is to influence the human will in such a way as to bring the eternal into time; to make men feel that they may live the eternal life in the midst of time; and to make them attempt this divine task immediately. This definition may seem vague and abstract, but neither *eternal* nor *will* can be omitted from it. The teaching of morality without reference to spiritual motives is not preaching. The words *eternal* and *spiritual* are indeed difficult of definition, but the practical and progressive definition of these words is precisely the homiletic task.

So far as literary art is concerned, this end may be achieved by, say, three means: vitality of diction, vitality of organization, vitality of direct appeal.

Vitality of diction may best be studied in the sermons of the Christ. What strikes the literary student here is the variety, homeliness, beauty, and freshness of the language. The kingdom of heaven is not formally or scientifically defined. It is a kingdom of children, and of men reborn. It is a pearl, a net, a wedding-feast, a piece of silver, etc. This warm flood of fresh spiritual poetry was poured by the Great Preacher into the formal and frozen vocabulary of the Pharisees. No evangelist can be effective who does not learn this lesson. Preaching means relating the eternal to the ever-changing temporal, and the universally spiritual to the individually human.

Vitality of organization means that the whole sermon is easily grasped, that its main divisions are easily remembered, and that the point of the whole could be expressed in one paragraph or sentence.

Vitality of direct appeal means that the end is direct and forcible; that the peroration is not for display, but to accomplish a piece of mental hauls. Lyman Beecher drove one of his theological students back into the pulpit, and cried: "You have not cracked your whip; your whip has no lash." The figure was not wholly happy, for a preacher should leave his audience with a sense that he loves their souls more than he loves to lash them. But it emphasizes the indispensable appeal to the will.

Preaching from texts is primarily exegetical; but exegesis must not stop with formal explanation; it must run deep into life; here and now there are words and situations of common life which are essential to such exegesis as really comes home to men's business and bosoms. From the literary point of view there is one thing about texts, which the present writer does not remember to have seen mentioned. The Bible is full of superficially contradictory texts. This is because, of all books, it is truest to life. It does not blink the paradoxes of experience, but reconciles them by the will. A sermon on private prayer (Matt. 6: 8) should logically include or be followed by one on religious solidarity (Matt. 6: 10). It is characteristic of the Christ that he demands the coming of the whole kingdom as the first interest in the most private petition.

The diction of sermons should have a full Saxon element, and should be free from aeolisms. The pulpit has done too much toward introducing such pretentious words as *enthuse* and *mentality*. The pro-

nunciation of the preacher should be correct, not eccentric; this is for no other reason than that false or eccentric pronunciation diverts the attention of the critical (and that means all the young) from his message.

**Lecture** means "reading," and most lectures are read—at least by the authors. They vary from the technical lectures of a university to the popular humorous lectures of a Bill Nye. Even in the case of popular lectures, no two styles or messages could differ more than Matthew Arnold's lecture on *Numbers* differs from Artemus Ward's on *The Alchemist*. In the very same evening Wendell Phillips used occasionally to give his famous lecture on *The Lost Arts*, and follow it with an impassioned appeal to the same audience on the iniquity of slavery.

But in all popular lectures it is the primary purpose to please rather than to exhort. There must be fresh information, and there must be fresh humor. Scientific terms, if used at all, must be used sparingly, and must be explained. A wise lecturer will note the effect of his first delivery on the audience, and will remodel the lecture accordingly. Long descriptive passages will be shortened. Even in narratives of travel the human element must be present in every paragraph; for, as Stevenson said: "Nobody talks about mere scenery for more than two minutes at a time."

**Business English. Social and Business Letters.**—Saxon and Latin Elements.—Many of our most technical business words are of Latin origin; e. g., *advertise, auction, bill, bona fide, bonus, cancel, capital, chest, credit, collateral, competition, co-operation, corporation, currency, fiscal, fortune, gratis, grocer, guinea, interest, item, lien, mint, money, pecuniary, pound, premium, redeem, salary.*

A study of the history of these words, as found in any good unabridged dictionary, will throw a flood of light upon the movements which have produced modern business conditions. But, apart from these technical terms, it is inadvisable to load business English with Latin derivatives. Saxon terms still make the strongest appeal to the emotions and the will, and goods cannot be sold unless the will is touched. Plain, simple, strong words are the most effective. People's love of food, dress, the family—this must be reached; and it is best reached through words which were earliest associated in the buyer's mind with these deep interests.

**Degree of Dignity.**—But plain, simple words are not necessarily slang words. Business slang has so vast a vocabulary that it vitiates the usage of everybody. Business expressions are tending to displace social and literary expressions. Many Americans speak of "the balance" of the day instead of "the rest"; they speak of a man as "well posted," as if he were a ledger; and instead of asserting, declaring, maintaining, contending, they "claim" everything.

The young business man will not regret mastering certain more dignified phrases for many of the commoner vulgarisms of business parlance. If he is in the habit of saying *ain't*, he should master the following: *I'm not; you're not or you aren't; he's not or he isn't; we're not or we aren't; they're not or they aren't.*

Business English cannot always be as dignified as literary English, for business deals with all sorts and conditions of men. But a business man must command more than one vocabulary. Note the following

list of phrases, the second of which in each pair is the more dignified: *knock, complain; boast, praise; folks, family; cheap, inexpensive; back down, recede; anyway, at all events; a great success, very successful; mighty fine, extremely fine; right then, just then; quite a few, several; fired, dismissed; faked, falsified; hadn't ought, ought not; endorse, approve; auto, car; without, unless.*

These are merely examples. Different situations and different customers require different vocabularies. But in general, business English should be plain and forcible without being vulgar. It is an error to think that educated customers wish to be addressed in magnificent words and swelling sentences. A truly educated man speaks simply. He goes to bed—not "retires"; has legs, not "lower limbs"; eats dinners, not "banquets"; builds a house, not a "residence"; calls a soup delicious, not "elegant"; has in his house a kitchen, not a "culinary department." If he receives a booklet advertising certain goods in highflown and bombastic language, he is as much offended by it as if it were full of such words as *fake, knock, boost, graft, boodle, swell, coads.*

**Wordiness.**—Time is money, and business English should cultivate brevity. A few words that catch the eye, hold the attention, present the arguments in a nutshell, are better than wilderness of fine expressions. This principle applies to every form of business composition, from advertisements to reports, from letters to booklets. Yet there is no merit in mere brevity. The few words must be the right ones. The short paragraphs must contain much meaning. Important facts must not be omitted. And if a good deal depends on one word, that word should appear often enough to be remembered.

This is particularly true in advertisements. A good advertiser keeps his key-word before the people. He varies the context to give freshness and attract attention, but he does not allow you to miss his precious word—his "Napoli" or "Gold Dust Twins" or whatever it be. Into that word or phrase he packs as much of his story as possible.

Also the name and address of the maker are never absent from a good advertisement.

The headlines of an advertisement, like the headlines of a newspaper item, are extremely important. Their business is to catch the fleeting attention, for (as has been proved by the investigations of Professor W. D. Scott) people do not spend more than one-tenth the time on advertisements that they spend on the text of a paper or magazine, and many persons are unaware that they ever read advertisements—though we all do. A clear Saxon phrase, striking at once into some genuine human instinct or interest—this is the proper opening of an advertisement.

Not the price, but the quality—that is the important matter to name tellingly.

**Business Letters.**—We may distinguish three essentials of a good business letter: first, *courtesy*; second, *clearness*; third, *persuasiveness*. Brevity has been mentioned above.

**Salutation and Closing.**—Courtesy requires, first, that the salutation and the leave-taking should be free from brusqueness or indifference. Every man is entitled to the abbreviation *Mr.* before his name in the salutation and on the outside of the envelope. Physicians and other professions of men are never offended if their correspondents

take the trouble to give them their right professional title. Firms are entitled to be addressed as *Messrs.*, though incorporated companies—e. g., The Macmillan Company—are not usually so addressed nowadays. *Dear Sir, Dear Sirs, Gentlemen, Dear Madam,* are proper business salutations. The last-given applies equally to girls and married women. The leave-taking may be *Yours truly, Yours very truly, Very truly yours*—the capital being used for the first word only. An unmarried woman should prefix *Miss* to her signature, or should place her full address to the left. A married woman should sign her legal name, and then place to the left the exact address which she wishes to see on the envelope of the reply, thus:

*Yours truly,  
Ellen Gates Adams.*

*Address:  
Mrs. James Ward Adams,  
1372 Linden avenue,  
Chicago.*

Care should be taken to avoid hackneyed, curt phrases, such as "Yours received and contents noted." The letter should have some ease, some individuality. It should impress the receiver as a piece of the courteous conversation of an educated and alert business man. Note how beginnings of replies may be varied: "We are glad to learn from your letter of March 12," "The impression that we get from your favor of the third," "We are glad to have your inquiry of the seventh concerning," "You advised us on the fifth of last month that."

In cases where business relations are long established, the social form of salutation may be used; as, *My dear Mr. Jones*. This, however, should follow the full name and address of the person saluted, since business is business, and the letter is addressed to a particular Mr. Jones. Go out of your way to get his name right, and sign your own name uniformly every time; don't have John G. Jones doing business with F. H. Smith one day, and J. G. Jones with Frank H. Smith the next. Or, the name of the address may be put at the end of the letter, to the left of your signature.

Latterly it is the custom of many correspondents to begin sales-letters to strangers with the familiar *Dear Mr. Jones*. A good many people resent being so addressed by strangers. The form is not to be recommended, although it shows that the would-be seller is taking pains to be personal.

**Circular or Form Letters** are a necessity of modern business, and great things are claimed for them by houses that make a business of preparing and supplying them, together with specially inked ribbons which make it possible to match the salutation with the body. But no form-letter can wholly take the place of the individual letter. The personal touch at the end—"The last time I saw you"—cannot successfully be imitated in any form-letter.

In all business letters it is both courteous and persuasive to say as little as possible and yet as much as possible, provided conciseness and undue familiarity are avoided. The customer is not much interested in your affairs or your success; he is deeply interested in his own. You must learn to take his point of view.

**Collecting Letters.**—In answering letters of complaint or in sending collection letters, courtesy must be observed with especial care. The hotter your correspondent's tone, the cooler should be your own. Do

not argue with an angry man. Take all the blame you honestly can, and then be generous, if you would keep your trade.

Clearness means that descriptions and terms should be beyond mistake. Description of goods should be exact, but not tedious. The person addressed must receive a clear mental picture, and without undue effort. Try to hit the thing off in telling phrases, presenting the goods imaginatively—i. e., in a way that satisfies the buyer's needs.

**Sales Letters.**—A good sales-letter begins by nailing attention; the start is half the battle. It proceeds to describe the goods. Then it gives reasons for buying them—for the particular man's buying them; but he should not be furnished with descriptions of competing goods, for that divides his attention, increases his responsibility, and often unintentionally suggests buying elsewhere. Then the letter closes with some inducement to act promptly. The imperative mood—"Do it now!" is well enough if reasons and inducements have not been offered; otherwise it is an impertinence.

Too much care cannot be exercised in the selection of stationery, the type of engraving or printing, penmanship or typing, etc. The first impression of a letter is given not by its subject matter (ideas, phraseology), but by its general appearance. A letter represents to some degree its sender, and one should not forward a shabby or a gaudy missive; these characteristics do not inspire confidence.

**Social Letters.**—We distinguish (a) formal notes in the third person, (b) notes to a stranger, (c) notes to acquaintances, (d) intimate personal letters.

Formal notes should be in the third person throughout, except when engraving makes the word "your presence" necessary. Thus: *Mr. and Mrs. Charles Henry Webster request the pleasure of Mr. and Mrs. James Henry Hammond's company at dinner, Monday, June the seventeenth, at seven o'clock.* Below, at the left, appears the street number of the sender, and the date, thus: *1274 Washington avenue, June the third.* The acceptance reads: *Mr. and Mrs. James Henry Hammond accept with pleasure the kind invitation of Mr. and Mrs. Charles Henry Webster to dinner on Monday, June the seventeenth.* The sender's address appears below at the left. Regrets read: *Mr. and Mrs. James Henry Hammond regret that a previous engagement prevents their acceptance of Mr. and Mrs. Charles Henry Webster's kind invitation to dinner on Monday, June the seventeenth.*

These forms are pretty definitely fixed, and do not admit of much alteration or addition. The full names are used; it is at dinner in the invitation, to dinner in the reply; it is on Monday in the invitation, and on Tuesday or Monday in the reply. It is June third or June the third, not June 3d; and the year is not given. Wedding invitations of course give the year, and etiquette varies slightly in other details from year to year, as any good stationer is able to indicate. Previous engagement covers all excuses in regrets. Illness in the family, absence from the city—these expressions may be used, but are not necessary; and other excuses are inserted at the risk of bungling the note. Notes to a stranger begin *My dear Sir*, or *My dear Madam*, and his or her name appears at the left at the end. *Yours sincerely, Yours very truly* are proper endings. *Yours respectfully* is no longer used by careful writers in any sort of letter. *Yours cordially* is impossible in a note to a

stranger, and is of doubtful taste except when used by women in social notes. Observe the use of capitals in *Sir* and *Madam*, and the small letter in *dear* after *My*.

Notes to acquaintances begin with *My dear Mr. Jones*, *My dear Miss Jones*, *My dear Mrs. Jones*, and end *Yours sincerely*, *Yours very sincerely*, *Very sincerely yours*. The addressee's full name need appear nowhere save on the envelope. In no kind of note or letter should a clergyman be addressed or referred to as *Rev. Jones*. The initials, or the name, or *Mr.*, or *Dr.* must appear after *Rev.* The best form is *The Rev. William Mead Jones, D. D.*

Notes and letters to friends and intimates are of every shade of familiarity. *My dear Mr. Jones*, *My dear Jones*, *My dear William Jones*, *My dear Billy Jones*, *My dear Billy*, *Billy*—all of them are good if used with tact. Signatures vary from *Yours sincerely* to *Yours ever* or *Yours*, and may respond still farther to personal affection, whim, or humor. *Your friend* is very rarely used, but it comes from a certain people who mean it. The tone of intimate letters should be individual, recalling the very voice and gesture of the writer. All pretense, all stiffness, all bookishness must be absent from a truly intimate letter. In their place there is room for all the personal charm that the writer can command.

**FIGURES OF SPEECH.**—For practical purposes the distinction sometimes made between figures of speech, figures of grammar, and figures of thought, may here be discarded. The essential principle, which the reader may apply for himself, holds the same in all.

**Definition.**—A figure of speech is a means of expressing or intensifying one idea in terms of another. This fusion of terms is the essential principle of figures of speech; it is called *connotation*. That is to say, in addition to what is *denoted* or literally meant, there is *connoted* something else which serves as a helping or carrying idea. This connoted idea may be a distinct thought in itself, in which case its value is mainly illustrative; or it may be merely felt in the manner of expression, in which case it has an emotional value of some kind. The two values may be proportioned or blended in many degrees; but in any case the principle of connotation is present; the reader is made to think or feel somehow in terms foreign to the literal idea.

**Illustration.**—This connotation of ideas may be seen in its simplest form in the following paragraph from Macaulay, in which he is explaining the difference between two kinds of historical composition, the descriptive and the philosophical: "Of the two kinds of composition into which history has been thus divided, the one may be compared to a map, the other to a painted landscape. The picture, though it places the country before the eye, does not enable us to ascertain with accuracy the dimensions, the distances, and the angles. The map is not a work of imaginative art. It presents no scene to the imagination; but it gives us exact information as to the bearings of various points, and is a more useful companion to the traveler or the general than the painted landscape could be, though it were the work of the ever Rosa peopled with outlaws, or the sweetest of which Claude ever poured the mellowness of a setting sun." Here the terms applicable to a map and a painting respectively, used purely to illustrate, are of material aid in making clear a somewhat abstruse literal subject. On the other hand, we are aware of a heightened sense of the grandeur lamenting over Saul and Jonathan, says of them: "They were swifter than eagles, they

were stronger than lions." Here his sense of their worth is so keen that he greatly overstates the case, describing them in terms that belong only to another order of beings; this because his emotion has so borne him on.

### The Good Figurative Language.

It is a mistake to suppose that figures of speech are merely decorative and ornamental elements put on for display. Nor are they more natural to educated people and men of letters than to the common and unlearned. They are an even more primitive and spontaneous manner of expression than the literal; reflecting, as they do, the picturing play of imagination, more native to man than the logical powers. Figurative language has advantages over literal both for reader and writer. For the reader it is of advantage because it gives him the benefit of an associated idea more concrete or more intense than the literal, thus calling forth his more vivid realization. For the writer it is of advantage because it enables him to express a hard or subtle idea not only more clearly but in much less space; it enables him also to imply his feeling about some matter without dictating what the reader's emotion shall be. It is a kind of literary shorthand, conveying twice as much thought in the same space, thus economizing attention; and a literary tonic, using as it does twice as vivid terms and forms.

**Note.**—It follows from this that figurative language is especially adapted to the more inward and abstract ideas, which need to be reduced from hard logical processes to the picturing terms of sense perception. Thus, when Tenneyson wants to describe the subtle idea of the manifold meanings of poetry, he puts it: "Poetry is like shot-alik with many glancing colors. Every reader must find his own perception according to his ability, and according to his sympathy with the poet." Here the simile both shortens and vivifies the whole description.

**The Most Commonly Used Figures.**—It is not our practice here to make a minute list or analysis of the various figures of speech. It will be better to classify the most commonly occurring ones, reduce them to principle as the connoting idea is related to the literal, and refer them in each class to certain salient types.

As intimated in the paragraph of "Definition" figures fall into the two broad classes of *illustrative* and *emotional*; and as several figures in each class may be mere variants of one essential principle, they are best grouped according to types. **Illustrative.**—In this class, which comprises the forms most commonly recognized as figurative, the connoted idea is introduced merely for its interpretative and clarifying value; that is, the literal idea is associated with something more concrete, or better known, or more directly present to the senses. Three types may be named.

**Figures of the Similitude Type.**—In this type of figures the writer's effort is made purely illustrative; he is concerned with showing how in some point the literal idea resembles something which in other respects is totally different. Note that it is the general difference of class between the literal and the connoted idea which makes the figure; comparison of things in the same class is not figurative at all, but literal.

**Simile.**—When the idea to be illustrated is relatively simple it is said or assumed to be like something else; the word simile being just the Latin adjective *similis*, *simile*, like. Generally the comparing term, *like*, *as*, *so*, *resembles*, is expressed, though this is not essential.

**Example.**—The figures from Macaulay and Tenneyson are similes; the way in which they

apply the connoted idea to the literal explains itself. The following is a plain and telling simile from Abraham Lincoln: "Once let slavery get planted in a locality, by ever so weak or doubtful a title, and in ever so small numbers, and it is *like the Covered Walk or Bermuda grass*—you cannot root it out."

**Analogy.**—But the idea that need figurative illustration is not always so simple; they involve complex relations and principles that need to be brought out into the open, where the whole can be seen. Hence the simile can be used only so far as the idea deepened; it becomes not so much a likeness of things as a likeness of relations; one thing is represented as working in its sphere as does some other thing in its sphere. This deepening of the likeness, less picturesque perhaps but more charged with thought, is called *analogy*.

**Example.**—Abraham Lincoln's well-known illustration of the divided house is an analogy. Its point is not that the state is like a house, but that the state in a certain condition is like a house in an analogous condition. "A house divided against itself cannot stand. I believe this government cannot endure permanently half slave and half free. I do not expect the house to fall—but I do expect it will cease to be divided." A very familiar analogy is that between an argument and a chain, as a chain is no stronger than its weakest link, so an argument is no stronger than its weakest premise. Analogy is probably the most widely useful of all the figures of the simile type.

**Parable.**—In this figure the analogy is carried out in detail, in the form of a story or an extended description, so that not merely one but several elements of the connoted idea are made to convey a meaning and lesson. It is an analogy elaborated into a parallel case in need of the familiar objects or events are displayed in like relations.

**Example.**—The parables of the bible, especially in the teachings of Jesus, furnish the most perfect examples of this figure. A whole series of such parables are given in the gospel to explaining the real inwardness of the kingdom of heaven, in many aspects and relations. The following is one of his shortest parables: "The kingdom of heaven is like unto leaven, which a woman took, and hid in three measures of meal, till it was all leavened." In other parables he represented it as "like unto a grain of mustard seed," as "like unto a man that is a merchant seeking goodly pearls"; as "like unto a treasure hidden in the field," etc. (R. V.); and by such parables he revolutionized men's ideas of what the kingdom of heaven essentially is.

**Figures of the Identity Type.**—This type comprises the figures wherein the similitude is not expressed, but implicit; that is, the connoted idea is not likened to the literal, but squarely identified with it. By this type of figures the writer assumes that one thing is put more directly in position to think the matter out for himself.

**Metaphor.**—In this figure the type is embodied most plainly, the other figures being in fact merely aspects or enlargements of this. Instead of saying one thing is like another, it says, or assumes that one thing is the other. The word metaphor means a transfer; that is, of meanings.

**Example.**—In the following, from Chesterton, the literal idea conveyed is that men have many different ways of communicating ideas to each other: "In the words: 'In the last resort all men talk by signs. To talk by statues is to talk by signs; to talk by cities is to talk by signs. Pillars, palaces, cathedrals, temples, are all enormous dumb alphabet; as if some giant held up his fingers of stone.'" Here, it will be noted, the figure is finished by a kind of simile (as if, etc.). Metaphor, simile, in fact, often intersect with each other.

**Trope.**—This figure is merely metaphor in its most condensed and least obtrusive form.

The word, derived from a Greek word meaning to turn, denotes a word turned from its literal meaning to connote some figurative idea. *Trope* is by far the most frequent and spontaneous figure of all; all language, in fact, that has vigor and life in it will be found to denote its interest in large part from the words of metaphorical suggestiveness that it contains.

**Examples.**—Thus, to speak of a man's character as *warped*, or *twisted*, or *unbalanced*; of his disposition as *sunny* or *sour*; to speak of one as an *old-rummed man*, or as having intellectual *poise*, or as standing *four-square* to all the *wind* that *blows*, is to use the perfectly natural yet vigorous language of trope. Men are frequently using the vocabulary of their business or occupation in this accommodated sense, as when a person's sincerity of conduct is described as *straight goods*, or when a man who fulfills his promises is said to *deliver the goods*. A certain Cape Cod skipper once described an untrustworthy man's character by saying that "his center-board was crooked"; a farmer would perhaps have said that "you could not hitch to him." Stevenson describes the endeavors made by a certain community to dispossess a supposed haunted house of its infernal occupant: "Every kind of spiritual disincantment was put in requisition." (R. V.) When we speak of "improving the moral tone," we are employing the language of music for a more abstract idea.

**Personification.**—This is a form of metaphor in which the literal idea is conceived as a person, having something of the life and traits of personality; thus the idea is made to think, and act, in if alive. A very powerful figure, rightly used; its abuse consists in employing it idly or insincerely.

**Examples.**—Instead of enumerating the noble qualities with which a man was endowed by nature, Shakespeare puts the thought in far more vigorous form by making nature speak: "His life was gentle; and the elements So mix'd in him, that Nature might stand up And say to all the world, 'This was a man!'" Personification is fully at work here in the form of personal touches, a kind of trope, as for instance: "Ideas have hands and feet, as Hegel said, and move the world," where the metaphorical attributes of personhood in members is sufficient to suggest the life that inheres in personality.

**Allegory.**—This figure expands and carries out the metaphor, much as parable expands the similitude; only, instead of blending the literal and connoted ideas, it gives merely the connoted idea, in the form of a narrative or description, and leaves the reader to make out the literal meaning for himself. It is much used as a vehicle for moral or spiritual truth.

**Example.**—It is a mistake to deem allegory an obsolete form, or to associate it only with its great literary example, the thought of *Pierre's Progress*, or Spenser's *Faerie Queene*. Its principle can be seen equally well in a shorter example, such as the following, from a German source: "A man had a plain strong-bow with which he could shoot far and true. He loved his bow so well that he would needs have it curiously carved by a cunning workman. It was done; and at the first trial the bow snapped." Here a bow is made into a man; it is made for a second meaning of it; yet the reader cannot help getting a moral lesson from it. Another example employs the kindred figure called *emblem*, in which animals are endowed with personality: "An old ruinous tower; which had harbored innumerable jackdaws, sparrows, and bats, was at length repaired. When the masons left it, the jackdaws, sparrows, and bats, which were all of their old dwellings, and there were all filled up. 'Of what use now is this great building?' said they: 'come, let us forsake this useless stone-house!'" The figure is alluring, facile, apologetic, and parable are closely akin to each other, and frequently so run together that a minute distinction between them is impractical.

**Figures of the Selective Type.**—In this type of figures the connoted idea, instead of being taken from some alien class of objects, is selected from the class to which the literal idea belongs; that is, the part or accompaniment which is immediately concerned in the action—the business part so to say—is used, and the rest is left out or taken for granted. Thus the reader's attention is concentrated and economized. Two figures, alike in principle, belong to this type.

**Synecdoche.**—This figure takes a part for the whole, or, less often the whole for a part, and makes it do the work of the whole idea. The figurative suggestion may be conveyed either by the noun or the verb, as best serves the writer's purpose.

**Examples.**—1. A part for the whole. This is very common in the language of business or labor; as when we say so many *hands* for work in the field; so many *spades* for digging; so many *spindles* in a factory; so many *rifles* in the army; so many *sail*, or *hulls*, in a fleet. "Every eye shall see him; with fire and sword;" "sound as if some fair city were one voice," are synecdoches. 2. This is seen in the use of such a term as the *administration* for the persons in power. "That I may make thee an *assaultment*, and the inhabitants thereof a *slaughter*," is a Scripture synecdoche, the effect or result, as a whole, put for the cause of it. 3. "Coleridge sat on the brow of Highgate hill in those days," is a synecdoche conveyed by the verb; it is Carlyle's way of saying that Coleridge resided in Highgate at a certain period of his life, which (also by synecdoche) he designates as "those days."

**Metonymy.**—In this figure not a part stands for the whole, but the aspect or accompaniment or result of the idea which has most direct significance for the thought conveyed is selected to do the work. The word metonymy means a transfer of terms.

**Examples.**—In "The bright death quivered at the victim's throat," Tennyson is speaking of a sacrifice. In "the wine has drunk up the thriving business like a bottle of sherry," Stevenson names the result of a life of dissipation. "The pen is mightier than the sword," the moral instrument for what they produce: literature and war.

**Emotional.**—In this class of figures the connoted idea is not a definite image called up from a different class of objects, but rather a state of mind belonging to a different level of feeling: an emotion of wonder, or intense realization, or humor, or contempt, which draws the reader out of his ordinary placid mood to some degree of its own intensity. This emotional state is brought about not directly, but by assuming the manner of expression peculiar to such connoted mood and trusting to the reader's sympathy to share in it. Two types of this class of figures may be distinguished.

**Figures of the Intensity Type.**—In this type of figure the writer's feeling is heightened by his sense of the greatness or importance or deep meaning of his idea, and his manner of setting it forth corresponds. Of this type of emotional figures the most representative are:

**Exclamation.** which is simply an outburst of wonder, or exultation, generally expressed by an elliptical form of the sentence, in which the thought is not formally stated by an indicative verb, but held up, as it were, for contemplation and wonder. In cases where the thought is stated in full grammatical structure there is intensity enough in the context to support the emotion, which then is indicated merely by the mark of exclamation (!). The utterance of the emotion is often aided also by interjectional words.

**Examples.**—Hamlet's expression of wonder at the greatness of man is a very pure example of the figure: "What a piece of work is a man!

how noble in reason; how infinite in faculty in form and moving; how express and admirable in action; how like an angel in apprehension; how like a god!—Sitting as the figure is, the right use of exclamation is a delicate mark of literary skill. Especially, if the writer marks his emotion merely by an exclamation point, he must judge accurately if the emotional value of his context warrants it; and, if he ventures on the support of interjections, he needs to guard against giving the impression of forcing the emotional note.

**Interrogation.**—A figure used principally in oratory and animated argument, is the asking of a question, not in order to elicit an answer, but to imply strongly the opposite of what is asked. It connotes a conviction so strong that the truth of it cannot be gainsaid; it is thus a kind of challenge.

**Examples.**—In the following, from one of Burke's speeches, it can be felt how he is asking questions: not to get an answer, as if it were something yet to be investigated, but as indignantly challenging his hearers to make any other answer than is implied: "What! Gentlemen, was I not to foresee, or, foreseeing was I not to endeavor to save you from all these horrors, mischiefs and disgraces? Was I an Irishman on that day that I boldly withstood our pride? or on that day that I hung down my head, and wept in shame and silence over the humiliation of Great Britain? I became unpopular in England for the one, and in Ireland for the other. What then? What obligation lay on me to be popular?"

**Apotrophe.**—This figure is an address to some absent or distant object as if it were present and could hear and respond; it connotes the fervor of intense realization. Thus, with the connoted idea, is conveyed emotionally the beauty or pathos of the thought.

**Examples.**—In the following, Stevenson, filled with the vivid realization of the truth that men follow ceaselessly after vague ideals, and never attain them, breaks forth into this fervid address to them: "'O toiling hands of mortals! how many mischiefs and disgraces you know not whither! Soon, soon, it seems to you, you must come forth on some conspicuous hilltop, and but a little way further, against the sky, the great spires of El Dorado.'" The intensity of the apotrophe, it will be noted, is supported by exclamation. Note also this exclamation, "toiling hands," "unwearied feet."

**Figures of the Anlmus Type.**—In this type, as in the previous, there is a degree of intensity in the emotion; but the controlling element is the *kind* or direction of the emotion; it reveals how the writer would have his reader feel, in a sense of sublimity or of humor or of the absurd, toward the idea thus set forth—in other words, a certain *anlmus* toward it.

**Hyperbole.**—This is simply overstatement; describing a thing in terms so beyond all reasonable or possible bounds that the reader cannot be misled into understanding it literally; he adjusts the statement to fact, rather, in the spirit of it.

**Examples.**—The figure hyperbole, which is essentially a descriptive figure, actually to have had an interesting history. In the old times men used hyperbole because they could not set bounds to their own imagination; as when the Hebrews went out to explore the Canaan, reported that the cities of that land were "fortified up to heaven," and of the inhabitants: "we were in our own sight as grasshoppers, and so we were in their sight." Of the same army also it is said: "The children of the east lay along the valley like locusts for multitudes; and their camels were without number, and the sand which is upon the sea-shore." (R. V.) In modern times, however, it is used rather to induce in the reader an unbounded imagination, describing in exaggerated terms so that he will not try to measure or to number, but

simply surrender himself to an impression; as when an old-fashioned tattle is described by Hawthorne as "exhibiting as many feet as a centipede," or as when, describing an astonishing run in a violin passage, a nonmusical man avers that the performer played "more than a million notes."

One can produce much the same effect as in hyperbole by a studied *understatement*, an exaggeration in reverse; and this may be regarded as a kind of transition to the next figure.

**Irony.**—In this figure the writer's animus is so strong, and the real state of the case so obvious, that he says or assumes the exact opposite, in the certitude that his meaning will be taken as it is. It connotes various degrees of contempt, or resentment, or indignation, or ridicule. Being mainly a vituperative figure, it is best employed in a tone of playfulness and lightness, else the writer may injure his case by seeming morose and cynical.

**Examples.**—When Job says to his friends, in whose arguments he has discovered a fallacy: "No doubt but ye are the people, and wisdom shall die with you," we can feel the contempt with which he estimates their mental powers and conclusions. When Macaulay, describing a man whose character he detests, begins, "It may well be conceived that, at such a time, such a nature as that of Marlborough would print in the very luxury of lassness," the word *luxury* apprises us that he is putting his conduct in ironical terms; and he goes on to say, "Least his admirers should be able to say at the time of the Revolution he had betrayed his King from any other than selfish motives, he proceeded to betray his country." Here the animus is unrelieved by any lightness of touch; it is pure vituperation. Short handling of one's enemies does not make friends.

The figure *Irony* has many forms and degrees of intensity; giving rise to a whole class of kindred figures: from *Intuendo*, which conveys the ironical suggestion by light hints and touches; through *Satire*, which makes its way by the general ironical or disparaging tone of the writing; to *Invective*, which lets loose the indignant animus in undisguised and scathing terms. On the whole, irony is a rather dangerous figure; if much employed, it is apt to react on the writer's own disposition, or at best to misrepresent his character, especially to unsuitable readers.

**How Not To Do It.**—Figures are a wonderful means of giving life and vigor to

one's language, spoken or written; and probably all can think in figurative terms when the copy is set them by copyist; but not all are equally capable, and perhaps only the few, comparatively speaking, can originate a telling figurative style. It is here that the main caution—how not to do it—lies. Figures are not things to be manufactured in cold blood; they are essentially an appeal to the imagination; and it requires an active and controlled imagination, on the part of the writer, to employ them to their true purpose, or rightly to utilize the figurative language already current; for the language both of literature and of daily intercourse is as full of figure as it can be—figure full of pristine power for those whose minds are ready to apprehend it. The principal misuse or abuse of figures, in both prose and verse, comes from the prevalent tendency not to use them with thought and realization—not to keep them alive. The tendency may be noted in three ways.

**Dead Figures.**—Everything that is used becomes worn, and the more commonly it is worn the faster it wears out. Figures that to begin with were full of life and "go," become dead. The language is as thickly covered with dead figures as with green ones; and the use of slang in the current speech and journalism, from year to year, witness the use and decline of figurative expressions, telling tropes and phrases, which have their day, and either pass into the permanent fund of the language or lose their usage altogether. This is the main source of what is called slang. As to the use of slang, the caution is not against using it—everybody uses it more or less freely while it is alive—but against using it as a substitute for your own thinking, and without realizing that it is slang. To do that is to go on using a dead figure; and like all dead things, if kept too long above ground, its odor is so strong that of course this does not apply to coarse and dirty slang; to use that is malodorous from the start; it is of a piece with coarse and dirty manners.

**Mixed Figures.**—The caution that first rises in most people's minds is against mixing your metaphors so as to form an incongruous and ludicrous image of the whole idea. It comes from employing figures that have become so worn that the

image contained in them is not realized as an image, but only as literal; in other words, from not keeping your imagination active. As a result, the figures of various kinds are constantly mixed together in good and skillful usage; the passage may be a tissue of combined figures, each one doing its fitting work. It is only the incongruous mixture that is to be shunned; and this means simply that slipshod and heedless thinking is to be shunned, which, in fact, "goes without saying."

**Examples.**—"Gives under the yoke." 1. When Stevenson, speaking of certain suburban resorts in the vicinity of Edinburgh, says, "There are places that still smell of the plough in memory's nostrils," he is mixing three figures together: trope or metaphor (*smell*), metonymy (*plough*, for *farm usage*), and personification (*memory's nostrils*, as if memory were a person); and all the figures are alive. 2. When, however, a rustic preacher says "The Gospel ship is sailing on, full-laden and well-rigged, and will continue to sail and prosper, because it is founded on a rock," he is using two figures: the ship and the rock, and were both true; but the mixture of them makes an incongruous idea, the two members annulling each other. The literal of each idea is true, and it is the literal that he is thinking of; the figurative, long current in the religious vocabulary, has become worn and dim.

**Insincere Figures.**—The insincere use of figures rises from the mistaken notion that the figure itself, as a device and a trick, rather than the value of the thought and the honest conviction of the man, is to be relied on for the desired effect. Every figure, indeed, employed heedlessly, a counter as it were instead of a coin, is to some extent an insincere figure, because the man's mind is not in it; this needs no caution, however, its effect being merely futile. The main caution, however, applies to the emotional figures. To try to raise a tempest of emotion, by explanation or interrogation or apostrophe, when there is no true feeling to warrant it, has the effect of bombast, or what is popularly called "highfalutin." To indulge in hyperbole when the literal idea is an insignificant net value, is to betray either an unbalanced imagination or a desire to play on the reader's realizing powers beyond the warrant. There is nothing for it, after all, in the use of figurative language, but to keep your thoughts about you, your imagination active, and your aim sincere.

## DICTIONARY OF ROMONYMS

WORDS HAVING THE SAME OR NEARLY THE SAME SOUND, BUT DIFFERENT IN SPELLING AND MEANING

- |   |  |  |                              |
|---|--|--|------------------------------|
| a. Adda, join                                     | a. Badio, did                              | a. Berry, a small fruit                      | a. Cannott, an engine of war |
| a. Add, an oz                                     | a. Bail, a servant                         | a. Bury, about                               | a. Canan, a lake or river    |
| a. All, to be ill                                 | a. Bala, a bundle of goods                 | a. Birth, coming into life                   | a. Canan, a church dignitary |
| a. All, add up                                    | a. Bala, a dance-entertainment             | a. Birth, office or situation, on board ship | a. Cash, a vessel            |
| a. All, one of the elements                       | a. Ball, a round body                      | a. Blow, did blow                            | a. Cash, a caque, a helmet   |
| adv. Ere, before                                  | a. Bawl, to speak very loud                | a. Blot, a color                             | a. Cast, to throw            |
| adv. Er, over                                     | a. Baw, an animal                          | a. Blot, a color                             | a. Cast, to throw            |
| a. Heir, interior                                 | a. Bear, to carry                          | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. All, every one                                 | a. Bear, dog's cry                         | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. All, a sharp tool                              | a. Bear, outer rind of a tree              | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Altar, a raised structure for divine offerings | a. Barque, kind of ship                    | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Altar, to make different                       | a. Base, the lower part                    | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Analyst, one who analyzes                      | a. Base, the lower part of a stump         | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Analyst, order of animals                      | a. Base, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Anchor, of a ship                              | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Anker, a liquid measure                        | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ant, an insect                                 | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Aunt, a father's or mother's sister            | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| prefix. Ante, before                              | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| prefix. Anti, against                             | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ate, part of a circle                          | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ark, a chest; a large floating vessel          | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ascend, going up; rising ground                | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ascent, ascent (noun)                          | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Ate, did not                                   | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Aught, twice four                              | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Auger, a boring tool                           | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Auger, a sawtooth                              | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Aught, anything                                | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Aught, a thousand                              | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. August, name of a month                        | a. Bait, to prepare or offer an allurement | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. August, noble                                  | a. Bait, to lower (one's price)            | a. Bore, to make a hole                      | a. Cede, to give up          |
| a. Bad, not good                                  | a. Bait, an allurement                     | a. Bore, to make a hole                      | a. Cede, to give up          |

- [illegible]

**Die with, from.**—Invalids do not die with, nor from but of, a disease.

**Die from, with.**—One thing differs from another as appearance; one person differs with another in opinion.

**Direly.**—Not to be used in the sense of as soon as, but only as "Direly they came we left," but "We left directly" is correct.

**Disseminate.**—Provisional for *propagate*, and should not be used.

**Donate.**—An unauthorized formation from *donation*. Better say "I have donated."

**Don't for doesn't.**—Don't is the plural contraction of do not, therefore such common expressions as "He don't live here," "She don't like to sing," etc., are ungrammatical.

**Don't think.**—Instead of saying "I don't think it will rain," it is better to say, "I think it will not rain."

**Double negative.**—Double negatives in English are universally common but incorrect. Avoid such words as "I haven't never been there," "I haven't had but one vacation in ten years."

**Due, owing.**—That is which ought to be paid; as, "The note is due next month." *Owing* is used in the sense of on account of; as, "It was owing to his daring that the inscription was checked."

**Dutch for German.**—Do not say Dutch when you refer to German. Dutch refers to Holland.

**Each.**—Each is singular in number, and should be used with a singular noun and verb. Do not say "Each comes in their turn," but "Each comes in his turn," not "Each man were singled out," but "Each man was singled out."

**Elegant.**—Elegant means refined, of good taste. A man misused and much overused word.

**Else.**—This form is not justified by good usage. Else, by preponderance of custom, when *else* joined to *anaphora*, *emphatic*, *any one*, or *some one*, forms a possessive, the *s* is dropped, and *else* remains. Many, however, prefer to write the form *some else*.

**Emigrant, immigrant.**—These two words are often confused. *Emigrants* are people going out of a country; *immigrants* are people coming into a country.

**Endere or Indere.**—Do not say "Endere for the back of," but "Indere for the back of." *Indere* is the spelling now generally preferred.

**Enjoy.**—Poor fiction for this expression, should be avoided; no one really enjoys poor health.

**Enthusie.**—A verbal form not authorized by good usage. Better say, "I am enthusiastic."

**Equally as well.**—The *as* is not necessary; say, "Equally well."

**Especially.**—Be careful to see that a verb in the singular number follows. "Every man at his post."

**Every one, Everybody, Everything.**—These words, except "every one," should always be preceded by a singular pronoun. "Every one should mind his own business." "Everybody has his troubles."

**Evidence, testimony, proof.**—Evidence is anything that tends to convince; testimony is evidence given by witnesses; proof is whatever establishes the truth of a proposition.

**Except, Unless.**—Except is not to be used for unless. Do not say "Except I am delayed, I shall arrive at three," but "Unless I am delayed," etc.

**Existing truths.**—Existing truths should always be expressed in the present tense. Do not say "Galileo taught that the world was round," but "It is round."

**Expect.**—Expect refers only to the future, and is not to be used for think or suppose. Do not say "I expect I was there," "I expect you had a pleasant time yesterday."

**Farther, Further.**—Farther refers to linear distance. "We had gone farther than I supposed." Further measures quantity or degree, as, "I shall speak further on the question."

**Fellow.**—Not correctly used for woman. Fellow is used in a few cases, but of different meanings. "Few persons like Mr. Jones' means that he is generally disliked. A few persons like him" means some, and perhaps all who know him.

**Firstly.**—Not an approved form. First is both an adjective and adverb.

**First-rate.**—Correctly used as an adjective. "He has a first-rate place," but not "He did first-rate."

**Former, latter.**—The former refers to the first of two things, the latter to the second. "He stopped to get the machine." "He stopped to get the former rule" or "the latter member."

**For is.**—Do not say "I went for to see the show." It is superfluous.

**Funny.**—The word should not be used to mean strange or curious.

**Gesture.**—This word should never be used. *Gesticulate*—Not to be used as a verb. Do not say "The speaker gesticulated frequently." Say, rather, "He gesticulated."

**Get.**—Strictly, *get* means to obtain by voluntary effort. It does not signify mere possession. Do not say "I haven't got my rest," but "I haven't a rest." *Get* is also preferred by good writers to *get in* such expressions as "We had got in from our illness."

**Get over.**—Often incorrectly used for *survive* or to *survive*.

*reover*, as "He got over the disease," or "He got over a fact," meaning to *revert* it.

**Get to go.**—This expression is common in some parts of the country but should not be used. "I was unable to go," or "I was prevented from going," rather than "I didn't get to go."

**Good.**—This word is used in many incorrect expressions. "I have walked a good deal," "The boy looked about a good deal better than sleep."

**Good night.**—Do not say "Good night" as an adverb. Do not say "You sang good." "Did you sleep good last night?" In these cases *well* should be used. *Good* is used in the sense of *well* as in "The United States to mean think, as in 'I guess you are right' for 'I think.'"

**Had out.**—A provincial and incorrect. *Had* or any form of the verb *to have* cannot correctly be used as an auxiliary with *ought*. Use *should* or *ought* but not "He *hadn't* ought to have gone," but "He *should* not have gone."

**Hang.**—A vulgarism. There is no such contraction for *have not* or *has not*.

**Hang, Hanged.**—The verb *hang* has two forms for the past participle, *hanged* and *hung*. *Hanged* is used for persons, *hung* for other objects. "The man was hanged." "The coat was hung on the rack."

**Health.**—*Healthful*. That is *healthy* which is in good health; that is *healthful* which promotes health. The family was in a *healthy* condition, but the child had been living on *healthful* food.

**How.**—*How* is not to be used for *what* nor for "What do you say?"

**Human.**—Not to be used as a noun. Do not say "The house was not fit for humans to live in."

**Idea.**—Not to be used in the sense of *percept* or *beautiful*; it properly means that which exists in the mind. "His ideas are high."

**If I was.**—Use *was* instead of *were* in all cases where the conditions are contrary to fact. "If I were you, I would do it." "If I were a man, I should practice law."

**I'm not sure.**—Use the indicative in cases of uncertainty. "If I were you, I did not do it." "I did not do it, I am uncertain as to whether I was or not."

**Illy.**—Should be avoided; it is the proper word, but not a positive and adverb. "He did the work very illy."

**In, into.**—Use *in* to signify rest in a place; use *into* to signify motion into a place. "He was standing with his hands in his pockets." "I put my hands into my pockets." I came in an attitude of *in* to the door of his office."

**Inaugurate.**—The word means to induce into office or to make a ceremonious beginning. It is not to be used in the simple sense of *begin*.

**Individual.**—The word should not be used in the mere sense of *person*. The word is correctly used in "Chemical bodies are individual." Do not say "Individual, cleft." The *cleft* or *split* signifies that the individual is with an adverb between the two words.

**Initiate.**—The word ought not to be used simply for *begin*. The word suggests ceremonious initiation. "The candidates were initiated into the lodge."

**In our midst.**—The possessive case is not to be used, but rather a construction with *of*; as, "In the midst of us."

**Invite.**—Not to be used as a noun. Do not say "I received an invite," but "I received an invitation."

**Kind of a.**—This is superfluous.

**Lady.**—This word is not to be used for *wife*, or to mean simply *woman*.

**Learn, Teach.**—These words are often vulgarly misused. *To learn* is to receive instruction; *to teach* is to give instruction. "I can learn if you will teach me."

**Lead.**—*Lead* is a verb; from a noun. I lend a man a dollar, and he receives the loan.

**Less, Fewer.**—*Less* has to do with amount or quantity, and *fewer* with numbers. "He had less money and fewer clothes than he needed."

**Let.**—Requires the objective case. "Let him with his gun." Not "Let he and I."

**Like.**—See *As*.

**Lie, Lay.**—See *Verb*. These verbs have been so confounded as to deserve some notice. *To lie* is to recline, and designates a state; *to lay* is to act, and denotes an action on an object. It is properly to cause to *lie*. "A thing lies on the table." "Some one *lays* on the table." "He lies with his father." "They *lay* him with his fathers." In the same manner, when used idiomatically, we say, "I *lie* thing here by us," and "I *lay* it into use." "We *lay* it by for some future purpose."

**Lie, Lay.**—The confusion arises probably from the fact that *lay* appears in both verbs. The words are correctly used in the following sentences: "I lay myself upon the bed (action). I lay upon the bed (rest)."

**Lie, Lay.**—I laid myself upon the bed (action). I have lain upon the bed (rest). "I have laid an egg (action). A ship lies at the wharf (rest)."

**Lie, Lay.**—The murdered Lincoln lay in state (rest); The crowd lay on the relief (action).

**Like, As.**—*Like* has a prepositional use, but as a conjunction, it is not to be used.

**Like, As.**—Do not say "It looks like it was caused by fire," but "It looks *as if*," etc. The following are correct: "My brother looks like me," "He acted as if he were insane." "Do it as I do."

**Likely.**—See *As*.

**Limb.**—Do not use *limb* when you mean *leg*. *Limb* may be applied to any member, and it is not more modest than *leg*. "The woman had her leg broken."

**Lit.**—Not to be used for *lighted*. Instead of saying "He lit the gas," say "He lighted the gas." Do not say "He lit on his feet," but "he lighted on his feet."

**Locate.**—This word should not be used in the sense of *settle* or *locate*, inactively, to mean to sit or place in a position; as, "He located a claim."

**Lot, Lots.**—Very inelegantly used for a great many things. Do not say "He had a lot of money left him;" "She looks a lot like her brother." The word means a distinct part or portion. "He divided his goods into lots."

**Launch.**—An authorized form both as noun and verb, but not considered so elegant as a noun as *launch*.

**Mad.**—Should not be used for *angry*. As a noun as *madness*.

**Mail man.**—An inelegant form for *postman*.

**Me being.**—Do not say "He did not know of me being there." The possessive case is required. "He did not know of my being there." "There is little chance of my being there."

**Monstrous.**—*Monstrous* means abnormal or deformed. Not to be used for *large* or *immense*; as, "It was a monstrous man."

**Most.**—Not to be used for *almost*; as "He is here most every day."

**Mutual.**—Not to be used to mean common, but reciprocal. "We may have a common friend, but a mutual dislike." That is, a dislike for each other.

**Myself.**—Do not use *myself* for *me*. Do not say "John and myself are friends;" but "John and I," etc.

**Near.**—Not to be used for *nearby*. Say "He was not nearly so unamiable as his brother." Instead of "Not so very unamiable."

**Nearly.**—Should not be used as an adjective. We may say "The house is nearly," but not "A nearly house."

**New beginner.**—Omit the *new*; all beginners are new.

**Nice.**—A very generally misused word. Properly *nice* means delicate, discriminating, fastidious. It is little used in the sense of *pleasant*.

**Not as.**—Do not use *not as* to mean *as*. "The man may be nice in his manners. The word should not be used to mean *aggressive* or *charming*," as "I had not as nice a man."

**Nicely.**—Do not use *nicely* for *well*. As "The sick man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

**Not as.**—Do not use *not as* to mean *as*. "The man is doing nicely."

à propos (d'œ œ p' p'p'œ), at the proper time.  
à propos de rien (d'œ œ p' p' d'œ œ r'j'nt), apropos to nothing; not pertinently.  
arc-en-ciel (d'œ œ œ œ œ), rainbow.  
à ras de champagne (d'œ œ r'œ d'œ œ œ œ), even with the ground.  
argent comptant (d'œ œ œ œ œ œ œ), ready money.  
à riveder (d'œ œ œ œ œ d'œ œ), adieu until we meet again.  
à Rome comme à Rome (d'œ œ r'œ œ œ œ œ œ), at Rome do as Rome does.  
arrière pensée (d'œ œ œ œ œ œ), mental reservation; unwavering purpose.  
assignat (d'œ œ œ œ œ), French paper money issued after the revolution at the end of last century.  
atelier (d'œ œ œ œ), a work-shop; studio.  
à tort et à travers (d'œ œ œ œ œ œ œ), at random.  
à toute outrance (d'œ œ œ œ œ œ œ), desperately; tremendously; with a vengeance.  
à tout hasard (d'œ œ œ œ œ œ), at all hazards; at all events.  
à tout prix (d'œ œ œ œ œ), at any price.  
attache (d'œ œ œ œ), an official belonging to an embassy.  
à bon droit (d'œ œ œ œ œ œ), with good reason.  
à bon sens (d'œ œ œ œ œ œ), at the end of his Latin; to the extent of his knowledge.  
au contraire (d'œ œ œ œ œ œ), on the contrary.  
au courant (d'œ œ œ œ œ), fully acquainted with matters.  
au dépeint (d'œ œ œ œ œ œ), in despair.  
au fait (d'œ œ œ œ), to the point.  
au fond (d'œ œ œ œ), to the bottom.  
au wiedersehen (d'œ œ œ œ œ œ œ), till we meet again.  
au levant (d'œ œ œ œ œ), to the east; eastward.  
au pis aller (d'œ œ œ œ œ œ), at the very worst.  
au reste (d'œ œ œ œ œ œ), besides.  
au revoir (d'œ œ œ œ œ œ), till we meet again.  
au sujet dit, au sujet fait (d'œ œ œ œ œ œ œ), no sooner said than done.  
autant d'hommes, autant d'âmes (d'œ œ œ œ œ œ œ), as many men, as many minds.  
auto da fe (d'œ œ œ œ œ œ), a sort of faith; the burning of Jews and heretics.  
autre droit (d'œ œ œ œ œ œ), another right.  
autre fois (d'œ œ œ œ œ œ), another time.  
autre vie (d'œ œ œ œ œ œ), another life.  
aut vincter aut mori (d'œ œ œ œ œ œ œ), victory or death.  
aux armes (d'œ œ œ œ œ), to arms.  
aux prières (d'œ œ œ œ œ œ œ), prayer; Introductory matter.  
avec permission (d'œ œ œ œ œ œ œ), by consent.  
à volonté (d'œ œ œ œ œ œ œ), at will; at pleasure.  
à votre santé (d'œ œ œ œ œ œ œ), to your health.  
à votre santé (d'œ œ œ œ œ œ œ), to your health.  
à votre santé (d'œ œ œ œ œ œ œ), to your health.  
aux champs (d'œ œ œ œ œ œ), a country ball.  
ballon d'essai (d'œ œ œ œ œ œ), a balloon sent up to test the direction of air-currents; hence, a suggestion to gauge public feeling on any question.  
bas bleu (d'œ œ œ œ œ), a blue-stocking; a woman who seeks a reputation for learning.  
beau-ideal (d'œ œ œ œ œ œ), a model of ideal perfection.  
beau monde (d'œ œ œ œ œ œ), the fashionable world.  
beaux esprits (d'œ œ œ œ œ œ), men of wit, or genius.  
beaux yeux (d'œ œ œ œ œ œ), handsome eyes; attractive looks.  
bel esprit (d'œ œ œ œ œ œ), a wit; a genius.  
bel étage (d'œ œ œ œ œ œ), the second story of a house.  
belles-lettres (d'œ œ œ œ œ œ), refined literature.  
benedetto e vizio male che vien solo (d'œ œ œ œ œ œ œ), blessed is the misfortune that comes alone.  
ben-bravé (d'œ œ œ œ œ œ), well invented.  
bon mot (d'œ œ œ œ œ œ), a good word; a bugbear.  
bienvenue (d'œ œ œ œ œ œ œ), good man; welcome; decorum.  
bienvenue (d'œ œ œ œ œ œ œ), welcome.  
bijou (d'œ œ œ œ), a jewel; a treasure.  
bijouterie (d'œ œ œ œ œ œ), jewelry.  
billet doux, or billet d'amour (d'œ œ œ œ œ œ), a love letter.  
billets-d'état (d'œ œ œ œ œ œ), government paper; bank notes.  
blazze (d'œ œ œ œ), odd; gaudy.  
blanc (d'œ œ œ œ), surprised.  
bon ami (d'œ œ œ œ œ), good friend.  
bon bon (d'œ œ œ œ œ), a sweetmeat; confectionery.  
bon diable (d'œ œ œ œ œ), a jolly good fellow.  
bon gré, mal gré (d'œ œ œ œ œ œ), with good or bad grace; willing or unwilling.  
bonhomme (d'œ œ œ œ œ œ), good nature; easy temper; erudition.  
bon jour (d'œ œ œ œ œ œ), good day; good morning.  
bon mal (d'œ œ œ œ œ), a slight cold.  
bonne (d'œ œ œ œ), a nurse.  
bonne-hausche (d'œ œ œ œ œ), a luxurious meal; a toothsome tit-bit.  
bonne et belle (d'œ œ œ œ œ œ), good and handsome (said of a woman).  
bonne foi (d'œ œ œ œ œ), good faith.  
bon goût (d'œ œ œ œ œ œ), good taste.  
bon ton (d'œ œ œ œ œ œ), high fashion; first-class society.  
bon vivant (d'œ œ œ œ œ œ), a good liver; a jolly companion.  
bon voyage (d'œ œ œ œ œ œ), a good journey.  
boutique (d'œ œ œ œ œ), a small private apartment.  
bourgeoisie (d'œ œ œ œ œ œ), the body of citizens; burghs; the shop-keeping class.  
bravé (d'œ œ œ œ œ), patented.  
brusquerie (d'œ œ œ œ œ), rudeness.  
cérémon de la guerre (d'œ œ œ œ œ œ), the war office.  
charbonnier (d'œ œ œ œ œ œ), a coal merchant.  
échec (d'œ œ œ œ œ), a defeat.  
camaraderie (d'œ œ œ œ œ œ), good fellowship.  
canaille (d'œ œ œ œ œ œ), a low class of people; the rabble.  
canard (d'œ œ œ œ), a false story.  
cap-à-pied (d'œ œ œ œ œ œ), from head to foot.

carbonari (d'œ œ œ œ œ œ), members of a secret political society in Italy, carboni (d'œ œ œ œ), fast; Lent.  
carte blanche (d'œ œ œ œ œ œ), full power.  
carte de visite (d'œ œ œ œ œ œ), a small photograph upon a card.  
castello che dà crederci a voi rendere (d'œ œ œ œ œ œ œ), (d'œ œ œ œ œ œ œ), the fortress that parleys soon surrenders.  
casualties (d'œ œ œ œ œ), familiar talk.  
ce n'a pas de dire (that goes without saying), (œ œ œ œ œ œ œ), that is understood.  
ce n'est que le premier pas qui compte (œ œ œ œ œ œ œ), it is only the first step that is difficult.  
c'est à dire (œ œ œ œ œ œ), that is to say.  
c'est une autre chose (œ œ œ œ œ œ œ), that is quite another thing.  
chacun a son point (œ œ œ œ œ œ œ), every one to his taste.  
chaqueun d'eux son d'œ œ œ œ œ œ œ, every one inclines to his own side or party.  
Champs Elysées (œ œ œ œ œ œ), Elysian Fields; a public park in Paris.  
chanson (œ œ œ œ œ), a song.  
chansons à boire (œ œ œ œ œ œ œ), drinking songs.  
chapeau (œ œ œ œ œ), a hat.  
chapeau bas (œ œ œ œ œ œ), hats off.  
chapeau de bras (œ œ œ œ œ œ), a military cocked hat.  
chambre ardente (œ œ œ œ œ œ), the chamber where a dead body lies in state.  
chargé d'affaires (œ œ œ œ œ œ), one intrusted with state affairs at a foreign court.  
château (œ œ œ œ œ), a castle.  
châteaux en Espagne (œ œ œ œ œ œ œ), castles in Spain.  
chauffeur (œ œ œ œ œ), driver of an automobile.  
chef (œ œ œ œ œ), a man.  
chef de bataillon (œ œ œ œ œ œ œ), a major.  
chef-d'œuvre (œ œ œ œ œ œ œ), a masterpiece.  
chemin de fer (d'œ œ œ œ œ œ), a railway.  
chemin faisant (œ œ œ œ œ œ œ), by the way; in passing.  
chère amie (œ œ œ œ œ œ), a dear (said to a lady); a lover.  
che sera, sera (œ œ œ œ œ œ), what will be will be.  
cheval de bataille (œ œ œ œ œ œ), chief dependence.  
chic (œ œ œ œ œ), stylish, smart.  
chi face confessa (œ œ œ œ œ œ œ), ha ha who's silent admit his fault.  
ci git (œ œ œ œ œ), here lies.  
coiffeur (œ œ œ œ œ), a hairdresser.  
coiffure (œ œ œ œ œ), a headpiece.  
comme il faut (œ œ œ œ œ œ), proper, as it should be.  
comme tout portez vous (œ œ œ œ œ œ œ), how are you?  
commis voyageur (œ œ œ œ œ œ œ), a commercial traveler.  
compagnon de voyage (œ œ œ œ œ œ œ), a traveling companion.  
compte rendu (œ œ œ œ œ œ), rendered, a report.  
comptoir (œ œ œ œ œ), a counting-house.  
comte (œ œ œ œ œ), count.  
comtesse (œ œ œ œ œ), countess.  
con amore (œ œ œ œ œ), with affection, very earnestly.  
concerger (œ œ œ œ œ), a door-keeper.  
conclure (œ œ œ œ œ œ), to conclude.  
concurrence (œ œ œ œ œ œ), competition for, or as for, a prize.  
congratulations (œ œ œ œ œ œ), with diligence.  
congratuler (œ œ œ œ œ œ), to congratulate.  
confère (œ œ œ œ œ), a colleague.  
conférence (œ œ œ œ œ), a conference.  
conseil de famille (œ œ œ œ œ œ œ), a family council or consultation.  
conseil d'état (œ œ œ œ œ œ), a council of state; a privy council.  
consolation (œ œ œ œ œ œ), a kind of consolation.  
contrepoids (œ œ œ œ œ œ), an awkward mishap.  
cordon sanitaire (œ œ œ œ œ œ), a line of sentries to prevent, or for as a means of contagion or pestilence. Used also of other precautionary measures.  
corps diplomatique (œ œ œ œ œ œ), a dramatic body; a company of actors.  
cortège (œ œ œ œ œ), a procession.  
coulure de rose (œ œ œ œ œ œ), rose color.  
coup (d'œ œ), a stroke.  
coup de grace (d'œ œ œ œ œ), a finishing-stroke. (Formerly applied to the fatal blow by which the executioner put an end to the torments of a culprit broken on the wheel).  
coup de main (d'œ œ œ œ œ), a sudden attack, enterprise, or undertaking.  
coup de maître (œ œ œ œ œ œ), a master-stroke; with consummate skill.  
coup de pied (œ œ œ œ œ), a kick.  
coup de plume (œ œ œ œ œ œ), a literary attack.  
coup de pied (œ œ œ œ œ), a kick.  
coup d'état (œ œ œ œ œ), a first attempt.  
coup d'état (œ œ œ œ œ), a stroke of policy; a sudden and decisive blow, usually inflicted by a constitutional government.  
coup de théâtre (œ œ œ œ œ œ), a theatrical effect.  
coup d'œil (œ œ œ œ œ œ), a rapid glance.  
coupage sans peur (œ œ œ œ œ œ), fearless courage.  
route qui n'a rien de (œ œ œ œ œ œ), cost what it may.  
crève-cœur (œ œ œ œ œ), deep sorrow; grief.  
cuisine (œ œ œ œ œ), a kitchen; cookery.  
cul-de-sac (œ œ œ œ œ), the bottom of the bag; a blind alley.  
d'accord (œ œ œ œ œ), agreed; in tune.  
dame d'honneur (œ œ œ œ œ œ), a maid of honor.  
das geht alle nichts an (œ œ œ œ œ œ), that does not concern you.  
dame angare (œ œ œ œ œ œ), of good.  
dame de bonne grace (œ œ œ œ œ œ), with good will, willingly.  
debris (d'œ œ œ), refuse.  
débiter (œ œ œ œ œ), to clearance.  
débâter (œ œ œ œ œ), a young lady just entering society.  
dévoté (œ œ œ œ œ), open-breasted.  
dégagé (œ œ œ œ œ), free, easy, without constraint.  
de gâté de cœur (œ œ œ œ œ œ), in sport, sportive.  
de haute lutte (œ œ œ œ œ), by a violent struggle.  
dehors (œ œ œ œ œ), without; out of; foreign; irrelevant.  
déjeuner à la fourchette (œ œ œ œ œ œ), a cold breakfast.  
de mal en pis (œ œ œ œ œ œ), from bad to worse.  
démence (œ œ œ œ œ), dwelling; residence.  
demi-jour (œ œ œ œ œ), faint light.  
demi-laine (œ œ œ œ œ), a small cup.  
démontre (œ œ œ œ œ), to demonstrate.  
dépêche (œ œ œ œ œ), a dispatch; a message.  
dernier cri (œ œ œ œ œ œ), (the latest cry), the latest fashionable ad.  
dernier ressource (œ œ œ œ œ œ), the last resource.  
désagrément (œ œ œ œ œ œ), something disagreeable or unpleasant.  
désorienté (œ œ œ œ œ œ), confused.

[illegible][illegible]

## LITERATURE

Literature, in its most extended significance, comprehends everything written in a given language which is colored by the temperament of the writer. A geometrical treatise should be colorless, though Euclid's *Elements* are marked by a sense of form and proportion peculiar to the Greek mind. A plain statement of fact is almost invariably colored by the sentiment of the narrator and his belief as to what is interesting and important. In a narrower sense, literature is restricted to writings to which the temperament of the writer has imparted charm, whether by reason of his earnestness and breadth of mind, his love of nature or of his fellow-men, or his peculiar power of embodying impressions in a verbal form of attractiveness and suggestion.

To the writer, literature is a method of expression and communication. Men naturally desire to express themselves, to put into form their ideas on some subject that appears to them of interest and importance. Matthew Arnold, influenced largely by his familiarity with the poetry of Wordsworth, defined literature to be a criticism (expression of judgment) of life. It would be nearer the truth to say that it contained a criticism of life. As man is essentially a "social animal," in the phrase of Aristotle, he desires to communicate his views to others. Even Milton, whose soul "like a star dwelt apart," sought an audience "fit though few." This desire to express and to communicate is the impelling force to the creation of literature, even when some peculiar perversity makes a writer use a cryptic or unintelligible style. The desire to produce something beautiful—the artistic impulse—which at first would seem to be strictly individualistic, is compounded with and modified by the desire to express thought and sentiment and to communicate them to others.

This being so, it is evident that a writer must use the language of his time and must embody the views and general principles of his age. Even when a man addresses a remnant who adhere to the ideas of the last generation, or the few progressives who have an intimation of the future or have caught sight of the new light which is soon to be the "light of a common day" to the next generation, he must deal with ideas which are somewhere in vogue in his own time. For this reason literature is representative of its own age, though as the temperament which makes the writer is usually one which sympathizes with progress and hates embodied injustice, it tends to express the advanced ideas of that age rather than the reactionary or stationary ones. "Write on my tomb," said the poet Heine, "that I was a soldier in the cause of freedom." The same words might be engraved on Shelley's monument. There are many, like Shakespeare and Tennyson, to whom the ordered civilization of the present seems most significant; to others, like Sir Walter Scott, the pathos or magnificence of the past appeals more strongly. But all write for a certain number of those who sympathize with them; each must have a living audience.

For this reason the literature of any time is a mirror of the thought of the time, and as there is a gradual evolution of thought, not merely an accumulation of knowledge, the tone of literature changes with advancing civilization. It is a peculiarity of this evolution that it is not a continuous process, but is an irregular movement with periods of quiescence and of advance. Nor is the movement, as far as we can see, always in one direction. It seems to follow the line of least resistance, even if the impelling force is forward. Consequently, there are periods in which the national spirit—reflected in national literature—is in quite distinct moods. The prevailing views on politics, religion, philosophy, society, duty, and even property are gradually modified. For a number of years one set of these ideas seems prevalent, then they weaken and change, sometimes with great rapidity, and another period is inaugurated.

**ENGLISH LITERATURE.**—As the English nation is continuous, so the literature of one period is bequeathed to the next. It may seem that an early period was more energetic or more spiritual or more artistic than a later one, still the influence of what was taught in one century is never entirely lost. The best literature survives, and continues to exercise an influence on many minds long after the termination of the period in which it appeared. The bible and some of the plays of Shakespeare are still living influences. Men build on the teachings of their fathers for many generations, and the mental condition of the Englishman of to-day is a composite of the mental condition of Englishmen of every century back at least as far as the Conquest. Even the uninspired periods have significance, for something from them survives. It is as in the individual life: certain strenuous years or years of grief and soul-searching experience stand in our memory as important. Nevertheless, not a day passed that did not contribute to making us what we are. And in national literature, the least productive periods gave birth to some ideas traceable in the literary life of 1910.

**The Anglo-Saxon Period, 449-1066.**—The first two periods—the Anglo-Saxon, during which the invading Germanic invaders occupied the south and west of Great Britain; and the Norman-French, during which an army from France, under William the Conqueror, invaded the Saxon territory and established their leader as king of England—must be regarded from the literary point of view as strictly preparatory. The written languages were Anglo-Saxon, to read which requires much study on the part of an English-speaking person as to learn German; Latin, the language of the church and of international communication; and the Norman-French. It is not till there is an English language that English literature can be said to exist; and the English language, formed by the simplification of Anglo-Saxon and the sinking into it of a large number of Norman-French and Latin words, came into use in a form in which we can understand it, slowly, and was not used as a literary vehicle much before 1360, the date at which the Norman-French period is assumed to terminate. But as both Norman-French and Latin brought not

only words into the language but literary forms and modes of thought, the roots of English literature were spreading even before the language was formed. A brief reference to the works written in French, Latin and Anglo-Saxon properly finds a place in this review. The writings in Anglo-Saxon are the epic poem *Beowulf*, in the short, rhymeless, alliterative lines of the earliest times; the *Song of Widsith*; *The Traveler or Exile*; poems on religious subjects by Caedmon and Cynewulf, written after the conversion of the people to Christianity; King Alfred's translations of the legendary history of Orosius, of the ecclesiastical history of Bede, and of the *Consolations of Philosophy* by Boethius; the translations of the Gospels by the Venerable Bede, a monk of Yarrow; the Anglo-Saxon *Chronicle*, compiled at the court or at some monastery for many years; and various fragments of prose and verse which have escaped destruction. This body of the writings of our remote ancestors, though accessible only to scholars, testifies, especially in the case of Bede and Alfred, to their industry, sense of duty, responsibility and loyalty. Their writings in Latin are principally the *Ecclesiastical History of Britain* by Bede, and various fragments on kindred subjects valuable as "sources" for historians.

**The Norman-French Period, 1066-1366.**—The Saxon tongue assumed an inferior position after the Conquest, and passed through the stages called Early English and Middle English. For two centuries the language of literature was French and Latin, though the Anglo-Saxon literature was kept up fitfully till it ends abruptly in 1154, marking the death of the old civilization. Nevertheless, the writings in Norman-French must be regarded as a constituent element of English literature; for they were translated later into Middle English, and the chivalric romances, both in prose and verse, have been drawn upon down to the day of Swinburne and Tennyson. Of these the most important was the Arthurian cycle, taken originally from Celtic sources. The Normans, too, brought the light touch from France, and satire and jesting verse as well as short humorous stories were written and collected, and, in time, translated. These do not seem to be native with the Germanic races, who are more marked by sincerity and seriousness than by humor and gaiety. The Normans produced a large number of books which testified to their intellectual activity. Among these are Walter Map's *Court Triflings* and Latin rhyming songs of a bacchanalian cast, and the Launcelot legend in French, Wace's *Roman de Rou* and *Roman de Brut*, and a chronicle of the Norman dukes. Wace lived in France, in the part subject to the English kings. Geoffrey of Monmouth, a Welshman, wrote the long Latin history entitled *Chronicon*, *Sive Historia Britonum*, which, though largely fabulous, has proved a prolific source book for poets, and has been the foundation for a great number of histories down to Holinshed in Shakespeare's day. The principal writings in Middle English toward the close of the period were the *Ormulum*, a paraphrase of the daily gospel, with exhortations and homilies suggested by the Gospels, some of which have literary merit, and Layamon's long historical poem based on older books. The language of these is intelligible to us after a little practice. Robert of Gloucester also wrote a rhymed chronicle in English based largely on Geoffrey of Monmouth's book.

**First English Period, 1360-1425.**—In the reign of the great Edward III., when Chaucer was a boy, the national consciousness may be said to have become unified. France, no longer regarded as the mother country by the king and nobles, had become a foreign enemy. Into the stream of English speech had dropped a large number of French words like snow-flakes into a river. Chaucer (1340-1400) and Wycliffe (1324-1384) are the great men of this day—the former through a large body of poetry full of sense, wit, and imagination, and the latter through his sermons and translation of the bible. Chaucer illustrates for us the age of chivalry in his longer poems, and the eager, inquiring spirit of man in almost everything. He is, therefore, an example of what was said before; that one literature embodies the spirit of the age and presents its "form and pressure." Wycliffe gave form to the underlying seriousness of the English people, and their impatience with any foreign interference. Printing was invented late in this age, and gave literature a powerful instrument of expansion. Literature in Scotland began to assume character as part of British expression. The popular English ballads were a literary form of the day, especially on the border. These were composed by unknown authors, handed down in memory, written and edited by various professional amusers, and chanted or sung aloud at all sorts of gatherings. From this intimate connection with the public, they came to have the peculiar representative character, a certain directness and naïveté impossible to counterfeit, though they may seem to us rough and incomplete.

Perhaps the most important literary work produced in this period was the collection and redaction in prose by Sir Thomas Malory of a large number of the Arthurian romances called the *Morte d'Arthur*. This is the immediate source of much modern verse, and is in many regards noble prose. Chaucer's Contemporaries and Immediate Successors.—John Gower (1325-1408), John Lydgate (1370-1450), and Thomas Hoccleve (1369-1450) were by no means his equals, but William Langland (1322 to 1400, approximately) was the first poet to express the sense of injustice and hopelessness induced in thoughtful and sympathetic minds by the artificial inequalities of society and the hard lot of the unfortunate poor.

A book of some influence in this period was the absurd *Travels of Sir John de la deville*—if there was such a person. So strong is the love for the marvelous, and so late is the appreciation of the worth of accuracy in describing remote places, that this book was eagerly read, though evidently full of inventions, not to "use the uglier and shorter word." Imagination and reason, however, always try to intrude into one another's provinces, even in our venacious day. Sir Thomas More (1478-1535), a character of great worth and charm, chancellor of England, and beheaded by Henry VIII. because he would not render a legal decision in accordance with the views of that intemperate monarch, was the author of *Utopia*—written first in Latin. This is interesting as the first appearance in English of the imaginary commonwealth, the literary embodiment of the ideal toward which we are still blindly striving. It represents one of those compromises between individualism and altruism thus far possible only on paper.

**The Renaissance Period, 1525-1634.**—This period is called the "New Birth"

because the mediæval spirit largely disappeared with the Reformation, the revival of classic (Greek) learning, the extension of printing, the circumnavigation of the globe, the defeat of Spain, the invention of firearms, and the general economic advance of the community. These things combined to give men an access of mental energy and zest in life. The drama developed wonderfully from its germ in the religious mystery and the morality—pageants rather than plays—to a form which in its culmination in Shakespeare has ever since commanded the enthusiastic admiration of mankind. There were great writers in this period: Hooker, Marlowe, Shakespeare, Bacon, Webster, Spenser, Sidney, Raleigh, and a host of the second class. It was an age of great translations: North's *Plutarch*; Florio's *Montaigne*; King James' Bible; Chapman's *Homer*, and others of less note—remarkable not so much for fidelity as for transmitting the spirit of the original and clothing it in idiomatic, nervous English. The lyric verse of the period has the true song-like inspiration—witness the Songs in Shakespeare's and Beaumont's plays. Robert Herrick's short lyrics (1594-1634) are wonderfully felicitous; as, for example, *Gather Ye Rosebuds While Ye May*, No. 208; and *To Daffodils*, No. 316. Michael Drayton's *Ballad of Agincourt* is a spirited war-song. Greene, Lodge and Dekker were lyric poets as well as dramatists, and so was Ben Jonson. To enumerate the names and works of the writers of this period would require almost as much space as to chronicle the writers of novels of to-day in England. The serious poetry of the period: Michael Drayton's *Poly-Olbion*; Norton and Sackville's *Mirror for Magistrate*; William Warner's *Romans of England*, a rhymed chronicle of England; Shakespeare's *Richard the Third*; and Samuel Daniel's *History of the Civil Wars* (York and Lancaster), are not superior to the similar poetry of other periods, but add their testimony to the intellectual activity of the age. The English unrhymed pentameter or blank verse was introduced by the earl of Surrey in a translation of the *Aeneid*, circa 1545, and greatly improved by its handling by Marlowe in his plays. Shakespeare made it an instrument of wonderful flexibility, suitable for description, reflection, and all the multifarious phases of human emotion. Surrey and his friend Wyatt introduced the Italian sonnet into England, and this beautiful fourteen-line poem was used by many of the poets mentioned, in sonnet sequences of fifty or more, usually on some subject connected with the passion of love. The period gathered much inspiration in form and treatment from Italy, the home of the new learning, as is evident to any reader of Shakespeare's *Richard the Third*, who died the same year as Shakespeare (1616), wrote *The Principal Navigations and Voyages—at any time within the compass of 1500 years*. This begins, like the *Poly-Olbion* with fabulous narratives, but consists principally of authentic records, and the historian Froide rightly calls it the "epic of the English nation."

This period is the beginning of modern civilization. New England was settled, the Reformation begun, and thought was emancipated in many spheres. In spirit it is nearer akin to us than is any earlier period and the mental energy of its leading writers and the ascent in life shows how much greater is the effect on the imaginations of men of an advance in the

philosophy of life and the discovery of new realms of intellectual beauty and worth than of an advance in scientific knowledge and useful inventions which add to material resources and personal comfort without exciting in an equal degree the sense of wonder and intellectual curiosity which are the motive powers of great literature.

**The Puritan Period, 1634-1660.**—The freedom from interference in matters of religious doctrine and administration by the Church of Rome and from all fear of invasion by the kingdom of Spain which was achieved in the preceding period, made Englishmen more conscious of the importance of any authority whatever in church matters. The spirit of individualism and the belief that the bible and the example of the early church furnished an all-sufficient rule for bodies of Christian worshippers led to a revolt against the church of England. At the same time men began to question the authority of the king, and actually revived the study of Anglo-Saxon to prove that the monarchy was limited in power, and that the great council, or parliament, was supreme at least in all questions of taxation and control of the army. Charles I. was very jealous of his prerogatives or privileges, and believed that the authority of a king came direct from God. This belief, if carried out in practice, was evidently fraught with great danger to the liberty and self-respect of the subjects. It was intolerable to many Englishmen, who regarded it as directly contrary to inherited rights. The theoretical cause to an issue on the question of taxation, and as must always be the case where diametrically opposite theories of civil rights are held by nearly equal parts of the people, resulted in a civil war. This led to the beheading of the king, and the establishment of a protectorate by the general, Oliver Cromwell. England got into serious trouble with a king for seven years, but after Cromwell's death the son of the executed king was restored. The monarchy of England has been strictly limited ever since. As a matter of course, these momentous political events filled men's minds to the exclusion, temporarily, of the cultivation of literature, or indeed of any of the arts, except here and there where some solitary scholar clung to the culture of the past. But after the brilliant Renaissance England became the serious, sober Puritan England. It was not a less England but a different England.

John Milton (1608-74) was trained in the Renaissance culture. His early poems are Elizabethan in spirit, though in *Comus* the disdain of earthly pleasure which characterized the Puritan view of life is the controlling motive. He belonged to the Puritan body by birth and temperament and on the outbreak of the armed conflict he was at once drawn into the service of state. He devoted his life to defending the commonwealth, and treaties in Latin and English flowed from his pen. Though intemperate in controversial language—the mode of the time—these, especially the *Areopagitica*, in defense of a free press, are marked by great energy and elevation. A lucid prose style was not developed till the next century, so that his prose owes its reputation to fundamental qualities of thought, and not to elegance or clearness. During this time he wrote no poetry except some sixteen sonnets which justify his title of poet. Constant use of his eyes brought on a style blindness. After the Restoration he resided in London and dictated *Paradise Lost*, *Paradise Re-*

joined and *Samson Agonistes*. The great Puritan epic contains passages of dignified musical sublimity, and remains a great monument of genius, though the sentiment which inspired it is far removed from us.

Edmund Waller (1605-87), who spent a long life writing poetry, was of a different type. He was an opportunist, and, being caught in a plot to aid the banished king, Charles I., was himself banished to France, from where Cromwell allowed him to return after ten years. He introduced the rhymed pentameter couplet, somewhat in the style Pope made so familiar. He is in reality best remembered for his graceful song, *Go, Lovely Rose*.

Abraham Cowley (1628-78) was a consistent royalist, and accompanied the queen-mother to France. He was the favorite poet after the Restoration, and was esteemed by Milton. He introduced the "Pindaric Ode" form, afterward cultivated by Gray. His epic, *The Davids* has not much more than a historic interest. He was a man of fine character, great industry, and decided poetical gift.

Andrew Marvell (1620-78) was a consistent adherent of the commonwealth, and, like Cowley, a man of integrity and upright life. He introduced poetical satire. His ode on Cromwell is dignified and liberal, and contains the admirable verse on Charles I. on the scaffold, beginning:

He nothing common did or mean  
Upon that memorable scene.

The royalist poets, Suckling and Richard Lovelace, have achieved immortality by the spirit and felicity of a few songs: *To Lucasta, To Althea* and *A Ballad on a Wedding*. The theologian Jeremy Taylor (1613-67) and Thomas Fuller (1608-61) belong in this period, as does Sir Thomas Browne, whose prose treatises, *Religio Medici*, and *The Urn Burial*, have become classics by reason of the sonorous dignity of some passages and their appeal to our sense of the contrast between time and eternity, man and the universe. The delightful Isaac Walton (1593-1683) lived in this period, and wrote his *Complete Angler* and his *Lives of The Worthies*; but of course neither he nor the others mentioned in this paragraph are Puritans except in uprightness of life. Jeremy Taylor, indeed, has all the luxuriance of an Elizabethan.

**The Restoration Period, 1660-1702.**—This is a transition period from the Puritan austerity of morals and manners to the respectable good sense of the eighteenth century. The court was under French influence. The gay laxity of the Frenchman grafted onto English character is apt to produce a cynical profligacy abhorrent to most nations and to humanity itself. The drama, imitated in Dryden the neo-classicism of Racine without Racine's genius; and, in Wycherley, Congreve, Farquhar and Van-Brugh, the comedy of Molière without Molière's grasp of life. The literature of the period illustrates the period, but adds little or nothing to the world's great classics.

John Dryden (1631-1700) was a prolific writer and critic. His satirical political verse is full of wit and point, and his prose essays are not only good criticism but lucid and consecutive in style. Samuel Butler's (1612-80) *Hudibras* is rattling doggerel with flashes of wit. The true classic of the period is John Bunyan's (1628-88) *Pilgrim's Progress*. It was written when society was very corrupt but is a pure embodiment of evangelical Christianity and shows that a book to live in the after-

tions of posterity, must be fundamentally moral and representative of human life and emotion.

**The Augustan Period, 1702-1744.**—The age of Queen Anne was marked by urbanity and rationalism. In fact, the eighteenth century was throughout a common-sense century. The great mathematical period of the seventeenth century began to bear fruit in interest in natural science. Joseph Addison (1672-1719) and Richard Steele (1672-1729) were charming essayists in the light style, treating with delicate satire some social or literary topic of the day. Jonathan Swift (1667-1745) was a satirist of great power, and *Gulliver's Travels* are extremely entertaining narratives even if the reader miss the satire. Daniel Defoe (1660-1731), though best remembered by *Robinson Crusoe*, was a vigorous and voluminous pamphleteer, with a genius for journalism, then in its infancy. Pope's verse (1688-1744) is representative of the age—pointed, witty, and epigrammatic, but never rising into enthusiasm, social or intellectual; neither passionate nor profound. His mode dominated English verse for nearly a century, and is on the whole the best style for narrative or reflective verse. William Collins (1721-59) wrote odes into which he sought to infuse passion. James Thomson's *Seasons* show a true love for nature, and Young's *Night Thoughts* embody a conventional piety. All of these partake, though in a less degree than Pope's poetry, of the artificiality of the period.

**The Georgian Period, 1744-1800.**—The Georgian period is a continuation of the preceding, the date of the death of Pope being taken as convenient for dividing the eighteenth century. The advance in natural science began to bear fruit in industrial inventions, and the eve of England's great prosperity was inaugurated by the coke blast furnace in 1735, and Watt's steam-engine, 1769. The central literary figure of the period is Dr. Samuel Johnson (1709-84), whose dictionary was the first comprehensive attempt to arrange and define all the words in the English language. His poetry is largely in the manner of Pope, and his prose, in the two periodicals he published, *The Rambler* and *The Idler*, and in the *Lives of the Poets*, *Journal of a Voyage to the Hebrides*, etc., was the model for the century. To us his style seems formal and self-conscious, but he was emphatically a great writer. It is easy to imitate his balanced sentences and Latinitized diction, but the pith and wit of his phrases and the good sense of his thoughts are not so easily attained. Oliver Goldsmith (1728-74) had the gift of a less pretentious but more truly literary style. "He adorned everything he touched," Dr. Johnson said; and his two poems, *The Traveller* and *The Deserted Village*, are immortal by their melody and the kindness of the sentiment expressed. Edmund Burke was also a great writer and philosophical statesman. Johnson and his friends owe much to Boswell's *Life*, for James Boswell has a genius for reporting. In this period the first philosophical histories were written: Hume's *England* and Gibbon's *Decline and Fall of the Roman Empire*. The dramatists were far cleaner than those of the preceding period, and two comedies of Sheridan's, *The Rivals* and *The School for Scandal*, and Goldsmith's *The Squire* to Conquer are full of wit and humor, and remain a permanent possession of the stage. Thomas Gray (1716-71),

the shy and scholarly poet of Cambridge, is best remembered by his *Elegy Written in a Country Churchyard*, a poem whose gentle pathos appeals to the common heart. He wrote, too, some spirited odes, the *Progress of Poetry* and *The Bard*, which, though very carefully constructed, have never captured the public. The poets Crabbe and Cowper, though very different, may be linked together in that they wrote of everyday subjects, with no effort at elevation or heroics, and so did something to break up the artificial dignity which Dr. Johnson considered "good form" on paper. The Scotch poet Robert Burns (1759-96), the great song-writer of his land, is more typical of the future than any of the more correct and academic writers of the age; for he was a voice of the people, a prophet of manly individualism and sturdy democracy, a genius in full sympathy with humanity and a powerful satirist of social shams. In this period, too, the novel begins to assume distinct form in the hands of Fielding, Smollett and Richardson. Laurence Sterne (1713-68), though a sentimentalist, and, as a writer, full of artifice and affectation, gave in *Tristram Shandy* a model of whimsical, half pathetic, half non-sensical treatment of ordinary life which has had great influence on subsequent authors.

Toward the end of the period, the American Revolution, and still more the French Revolution, agitated violently the social atmosphere. The effect of this excitement is evident in Burke's *Letters on a Regicide Peace* and *Reflections on the Revolution in France*; but it was, from the literary standpoint, more potent in the next period. **The Romantic Period, 1800-1837.**—The general doctrine of the authority of the French king fell into a wicker basket in front of the guillotine. If there was no sacred character in the long established civil authority, why should there be any in the old literary standards? An emancipation based on individual rights is apt to spread a more determined spirit of human activity to another, and literature is but a reflection of life. Signs of rebellion against the standard of Pope and Johnson were not wanting in the close of the eighteenth century. Society is more than a well-ordered machine—it is a progressive and living organism. There is no one definite poetic form, nor is moderation and good sense the only literary virtues. Men are capable of enthusiasm, which to Dr. Johnson was a literary sin. They are capable of viewing things with wonder and excitement, of worshipping beauty blindly, and expressing themselves without the restraint of rules drawn from the practice of the past, which, guides to the fathers, become fetters to the children. Any revolt from conventionalism is really romantic, and in the nineteenth century such a revolt led to the disuse of the old literary fashions.

Two representative writers are William Wordsworth (1770-1850) and Samuel Taylor Coleridge (1772-1834). They felt that the spirit of the old ballads—partially represented in Percy's *Reliques* in 1765—was a true poetic spirit. They treated the life of men and women on every social plane, usually in the lyric form. The philosophical thought of Germany, transfused imperfectly through the mind of Coleridge, gave thinkers new intellectual conceptions. Walter Scott (1771-1832), in his ballads, songs and historical novels, viewed the past and its setting with the eye of a romanticist, though his tempera-

ment as an individual was conservative. In fact, admiration of nature in her wilder aspects—the mountain, the torrent, the storm—is a romantic motive akin to the recognition of ill-regulated human nature if only it be powerful and individualistic. This was the form romantic thought took in Byron (1788-1824). The enthusiastic Shelley (1792-1822) also disliked any form of social restraint. Pope and Johnson would have set him aside as a madman—we see in him a manifestation of generous traits, and admit his fundamental mistakes, but insist that:

The light that led astray  
Was light from heaven.

John Keats (1795-1821) is a passionate lover of beauty, an unsurpassed artist in words, while revolting from the old mechanical form, was not inspired as Shelley was by the enthusiasm for humanity. Charles Lamb (1775-1834), quaint and delightful essayist; William Hazlitt (1778-1830), a critic; Sydney Smith (1771-1845), wit and reviewer; Thomas DeQuincy (1785-1859), essayist and scholar; Thomas Moore (1779-1832), society poet and song-writer; and Thomas Campbell (1717-1844), author of some stirring war-lyrics, illustrate different phases of the intellectual life of this period. Thomas Parnell (1738-1845) and Winthrop Mackworth Praed (1802-1839) were writers, the one of humorous, the other of society verse of fine quality. Jane Austen's (1775-1817) novels are admirable sketches of the life of upper middle-class people, depicted with truth and quiet humor.

The period was marked by economic and industrial progress, and the invention of the railway and locomotive initiated the great advance of the latter half of the century.

#### The Victorian Period, 1837 to 1901.—

Though there is a marked distinction between early Victorian (to 1865) and late Victorian, it will be more convenient to consider them as continuous, the more so as they merge into one another and the poet Tennyson (1809-1892) belongs to the entire period. Thomas Macaulay (1800-1860) and Thomas Carlyle (1795-1881), though individually distinct, are markedly apart from historians of the later school; Gardiner, Stubbs, Lord Acton and the rest aimed at scientific accuracy rather than at a striking literary portraiture of the past. James Anthony Froude (1818-1894), however, perpetuated the old tradition that the historian must be an artist as well as a chronicler. Among the prose writers, John Henry Newman (1801-1890), John Ruskin (1819-1900), and, later, Walter Pater (1839-1894) take high rank as artists. The novel received early its highest development at the hands of William Makepeace Thackeray (1811-1863), Charles Dickens (1812-1870), George Eliot (1819-1880), and many minor masters. The number of good novels still produced in England is remarkable, though many of them seem to owe more to workmanship than to inspiration. Of the early Victorians, Anthony Trollope (1815-1892) is one of the most faithful depictees of social manners, and of the late Victorians, Robert Louis Stevenson (1850-1894) and John Galsworthy (1867-1933) are the most charming stylist but a constructor of semiromantic tales of vivid interest. Rudyard Kipling, in his stories of India, viewed life from a novel imaginative standpoint, and though inclined to deify material power and the life of reckless adventure, makes a convincing picture of the quiescent native civilization. The contrast between

the races is in his hands fruitful of humorous situations.

About the middle of the century (1850), Charles Robert Darwin (1809-1882) published his *Origin of Species*, and the general thesis, "things are not created, they grow," has modified very largely men's views of nature and society. Herbert Spencer (1820-1904), Thomas Henry Huxley (1825-1895) and John Tyndall (1820-1893) were among those who developed the central evolutionary concept in its applications to society and biology, and innumerable books have appeared in which the philosophy of development and growth is amplified.

The early Victorian age was an age of poetry, the later inclines to be an age of science. Alfred Tennyson (1809-1892) was devoted to the production of verse. His poetry is representative of the thought of his day, and is marked by finish and melody. Robert Browning (1812-1889) claims, it may be, a keener glance into the human soul, deeper psychical problems, than his great contemporary; but the obscure nature of his subject-matter renders him less generally acceptable. His wife, Elizabeth Barrett Browning (1806-1861), was a favorite poet in her day. All these have a marked lyrical gift. Dante Gabriel Rossetti (1828-1882), though primarily a painter, was also a poet of highly imaginative quality. Charles Algernon Swinburne (1837-1908) wrote a great deal of highly melodious verse marked by sonorous energy. His meters, largely dactylic and anapestic, have disclosed new musical resources in our language. Matthew Arnold (1822-1888), though known as a critic, was also a poet, and a few of his verses, though written in a minor key, will survive as an expression of the petulant depression which settles on thoughtful souls when the faith of their childhood is undermined and they lack impulse or force to build new foundations. George Meredith (1828-) might be mentioned among the poets did not the obscurity of his style render his meaning so cryptic as to be incommunicable, and communication to the reader of something more than a vague impression is one function of style. Meredith is a great novelist, and were he readable would be, perhaps, the greatest; but his enigmatical style presents too many puzzles for any but a specialist in paradox. Therefore Thomas Hardy (1840) must be reckoned first among the late Victorian novelists.

The drama of this period did not rise much above the level of mediocrity, in spite of the earnest efforts of Tennyson and Browning to infuse some poetry into it. Toward the end some of the "problem plays" satirized society without suggesting that it could ever be any better. The later plays which turn on some social question contain more earnestness. There is probably a time for the mocker like Shaw before the reformer, as Rabelais preceded Calvin. Since the opening of the twentieth century there seems to be an increase of seriousness almost painful in such a man as Galsworthy and the author of *The Servant in the House*. Without criticising in detail modern English literature, we may say that the tone is less flippant than it was ten years ago; that it appeals more to the genuine and broad emotions than it did; and that there seems to be a general recognition of the truth that satire and persiflage are not the only weapons for the writer, and that, to make a worthy work, he must base it on a worthy theme—some

of the old questions of sin and sorrow and injustice—and not on the superficial aspects of society or humanity.

It may be that economically, politically, and socially England is entering on a new phase of development. If so, literature, the expression equally of reason and emotion, may take on a new form of imaginative life; especially in that popular form, the drama. It is certain that earnestest social sympathy, stern love of justice, forward-looking hope and love have not perished among the people; and these, fused by the imagination, are elements of real literature, though a cynical, mocking, or hopeless feeling seems at present to deny them expression.

**AMERICAN LITERATURE.**—American literature is not readily or satisfactorily defined. It excludes all the literatures of this Western Hemisphere except that of the United States, and even in the United States is generally reckoned as exclusive of all languages except English.

**Branches of American literature.**—American literature belongs to the generic class English literature, of which other subdivisions are British, Canadian, Australian, and soon, but the specific difference between these several classes is primarily geographical and, therefore, not of much practical value.

**Provisional Definition.**—If American literature be defined as that part of English literature produced by Americans, the definition does not minister materially to clear thinking.

**Definition Discussed.**—Literature in general may, for purposes of convenience, be defined as the expression of human interests in artistic prose or verse, and then American literature might be the expression of human interests in artistic American prose or verse.

But the prose or verse of America does not differ materially in form from that of Great Britain, and, in the human mind, there is something distinctive, such as the *Leaves of Grass*, by Walt Whitman; or the *Marches of Glyn*, by Sidney Lanier; or the *Songs of the Sierras*, by Joaquin Miller. Or, American literature may be defined as the expression of American interests in artistic prose or verse, with an intimation that not all human interests, but merely some of them, make an appeal to Americans. But it is at least questionable whether Americans are not as catholic in their interests as any other nation, and hence as much inclined to make avail of all literary themes that would serve any writer's purpose. A third and perhaps feasible variation of this definition would be that American literature is the American expression of human interests in artistic prose or verse.

**Definition Accepted.**—This form of the definition concedes similarity of interests and methods, but suggests that there is possibly a difference in point of view, in fundamental conceptions, and in essential emphasis between an Englishman's and an American's treatment of similar themes. Such a difference may be readily discerned in the treatment of political, social, and religious themes, but is hardly to be noted in the realm of pure poetry. Perhaps this is as far as we can go in making any distinction between British literature on the one hand and American on the other.

**Beginning of American Literature.**—Unlike most literatures, that of America did not have an independent origin, but was a continuance in America of a litera-

ture well developed in the mother country. It was the projection of the English spirit into a new territory, where its subsequent manifestations were conditioned by its new environment and its changed purpose. This accounts for the fact that the beginning of our American literature is well-nigh coincident with our earliest English settlement; for it was in 1607 that John Smith founded at Jamestown this first settlement, and in the next year (1608) that he wrote his *True Relation of Virginia*.

In many respects, this book is almost too thrillingly romantic in its adventures and hairbreadth escapes to be wholly accepted as true history; but it is certainly of sufficient literary significance to be classed as our first specimen of American literature. This was followed by Strachey's *Wrecks and Redemption of Sir Thomas Gates*; and shortly after came the excellent translation of Ovid by George Sandys, begun in England and continued without loss of merit in this new land.

After 1620 there was a larger output in New England, for the Puritans began promptly to give expression to their supreme confidence in divine guidance and to their new-found freedom in religious thought and worship. Histories by Bradford and Winthrop evidence the hand of God in history, while Anne Bradstreet's poetry may have found its chief value in its religiousness. For literary style the *Voyage to Virginia* by Henry Norwood is perhaps the best book of this first period.

**Waxing Colonialism, 1647-1674.**—This period from 1607 to 1676 may be designated as the period of waxing colonialism, for in it the chief concern of the new colonists was to strengthen themselves and procure recruits from the home-land. This period came to an end in an incident so dramatic in its character and so far-reaching in its moral consequence as to be reckoned not a mere incident of history, but a vital link in the chain of cause and effect.

**Bacon's Rebellion, 1676.**—Bacon's rebellion, which was a protest against the arbitrary and tyrannical rule of a British governor, was in nearly every respect a prototype of that more significant protest just one hundred years later. This first Declaration was not written in words, but was elaborate in deeds wrought by that valiant young rebel, Nathaniel Bacon. At this very time, too, the New England colonists established their power to protect themselves by overcoming the Indians in King Philip's war. After these events the attitude of the colonists to the mother country could never be the same as before, though it was fully sixty years before this marked change in their relations was generally felt.

**Fixed Colonialism, 1676-1736.**—From 1676 to 1736, or thereabouts, our political life and our literary spirit might be characterized as that of fixed colonialism. This phrase signifies that the colonists had now become firmly established, with no thought of deserting their cause or surrendering their hard-earned territory; but, on the other hand, with no such supreme sense of loyal allegiance to England as had the earliest settlers. They were still dependent upon England, but this dependence had not become galling, for they had shown their power of independent action when necessary. Sermons and histories were the largest contributions of this period.

**Contrast in Spirit.**—In New England these histories and sermons alike were characterized by an overwhelming sense of obligation to divine power, while in the southern colonies they were enlivened by a fuller recognition of God's love as manifested in his dealings and exhibited in nature. This fresh, first-hand observation of nature gave rise to a new delight and enthusiasm in surprising scenery.

A comparison of Mather's sermons with Blair's, or of Bradford's history with Beverley's will illustrate this difference between the solidity and weight of the New England productions and the imagination and relative lightness of the Virginia books. William Byrd's *History of the Dividing Line*, with its sprightly comment on strange experiences and its irresistible humor, attests this literary quality even more pointedly. It was in this period that Penn gave in his life and letters a new meaning to colonization.

**Waning Colonialism, 1736-1764.**—From about 1736, when the first book was published in the south, to about 1764, which marked a dividing line in our development, comparatively little was actually achieved.

This period was marked rather by the birth of men who were to become distinguished than by occurrences or utterances of signal note.

While the literary production was limited it is impossible to believe that the outburst of independent and revolutionary thought about 1764 was not the result of long meditation and of brooding over injuries, real and fancied, and of a growing determination that one day they would be free. Jonathan Edwards is the preëminent figure in this period; but his mind turned more naturally to God's dealing with his people than to England's rule of her colonists. Ramey, an interested and intelligent contemporary historian, is clear in his own mind that the year 1764 is a turning point in our history. With that date came that outburst of oratorical arraignment and denunciation from Samuel Adams, James Otis, and Patrick Henry.

**Period of Nation-Making, 1764-1806.**—These men were the prophets and fore-runners of the proudest era of our history—that of nation-making. The vital and fascinating historical events of this period are the adoption of the Declaration of Independence; the Revolutionary war, which this declaration compelled; the provision of a constitution; the election to the presidency of the great leader who had led this war to a successful conclusion; and finally, the peaceful transfer of power from a pronounced Federalist like Adams to a self-consistent Democrat like Jefferson.

Coincident with these political achievements were literary manifestations of hardly less significance. In fact, it would not be difficult to defend the thesis that the triumphant oratory of Otis and Henry and others who came to their support, was as remarkable an event as the war itself; and certainly such papers as the Declaration of Independence and the constitution seem to be utterly inexplicable, unless one catch the full spirit of this new period of self-reliant ardor and determined zeal.

**Revolutionary Poetry.**—Closely akin to oratory is patriotic poetry, for the definitions of those two forms may be easily confounded. Anonymous songs, poems by Godfrey, Trumbull, Frenau, and others, give evidence that this emotional

life uttered by some in speech and by others in warfare, was guiding for others still the poet's stylus.

There was little time or demand for fiction in these trying times, and the academic essay must await a quieter day; but for illumined state papers or the prudential wisdom of a Franklin, there was alike the crying demand and the consequent supply.

**First Period of Nationalism, 1800-1850.**—

The year 1800 marks a peaceful transition from a decade in which men had dreaded a fancied imperialism, to an era frankly committed to an absolute trust in the people and a permanent democracy. It is, therefore, a convenient point from which to reckon our first truly national period. For the time, all difficulties had been overcome and differences adjusted and the dangers ahead hardly occurred to any but the sagest leaders.

**Jefferson to Jackson, 1800-1829.**—From 1800, when Jefferson was elected, to 1829, when Jackson became president, our country, passing through its era of expansion and of peace, pursued an even course; but when the new president took his chair a new tendency was observed. Up to 1829 our presidents had all been men of refinement and culture, bearing the stamp either of foreign training or of its best traditions. They were men of the social world, fit to meet on equal terms the world's sovereigns.

With the coming of Jackson, the rugged leader from the frontier, there were substituted for the polish and culture of the western European the training and self-confidence of the western pioneer. Nor was he much concerned with the affairs of western Europe. His mind turned instinctively to the land whence he had come; and his first thought was about strengthening the alliance, not between America and Europe, but between the several parts of his own country. It is not at all surprising that, with this new motive dominant in the capital, a new motif should run through our American literature and that the note of it should be independence and self-reliance. Perhaps this was best expressed at the time by Emerson's famous address, *The American Scholar*, which has been not untingly termed our literary declaration of independence.

This first period of our distinctive nationalism coincides with our first period of literary greatness, unless the preëminence of our Revolutionary orators be urged to the point that this was at once cause and concomitant of it. National pride is almost an essential of a national literature, and obviously a national literature ministers materially to national pride. Almost every form of literature was produced in this period, except the successful epic. Poems, plays, orations, novels, essays, histories, biographies and other types were produced before 1829, and became more abundant and more valuable after that date. Whether we turn to New England, the South, or the Middle States, this new interest in letters is noticeable.

**New World and Old.**—Great questions such as abolitionism, tariff agitation, internal improvement, etc., engaged the thought of party leaders like Clay, Calhoun, Webster; Longfellow was bringing the old world to the new by revealing its literary attainments; while Irving was showing to the old world that our own were not insignificant. Poe began and

ended in this period his career, that helped to give American literature an international value both in poetry and prose. Writers multiplied, magazines like the *Southern Literary Messenger* and *Grass* were established and maintained, and the reading public grew rapidly. New England readily assumed the primacy; but the Middle states contested her claim, and the Southern colonies showed no less versatility and native talent than these. It was especially in the period between 1829 and 1850 that literature flourished, and there was no diminution of its power when we reached its end.

**Clay Compromise.**—The Clay compromise in 1850 merely served to delay a disaster it could not avert, and produced no immediate effect upon literature.

**Period of Division.**—Even in the South, where the rumors and premonitions were thickest and loudest, the period of impending war was active in literary productivity.

**Impending War, 1850-1860.**—In fact, the greatest poetical succession our country has known, save that of Longfellow, Lowell, Whittier, in New England, was that line from the death of Poe (1849) to the death of Lanier (1881). A roll call of the names would include Hayne, Tinsel, Ryan, Pike, Thompson, Mrs. Preston, and many others. Fiction was fashionable everywhere, and the academic essay ran side by side with the partisan paper, and the academic oration gave place to the political address. Feeling ran high; and heated men to fervid and often eloquent utterance.

**War, 1860-1865.**—Even the war, lasting until 1865, could not entirely hush the literary voice; though it was true, in the South especially, that there was little time and perhaps little inclination to indulge in literary pursuits. There were battle songs and isolated poems, patriotic appeals and fiery ejaculations, and now and then the calm and solemnized utterance of the most thoughtful, but in all very little worth recalling by name in a single paragraph.

**Reconstruction, 1865-1876.**—On the contrary the literary activity between 1865 and 1876, the period of reconstruction, was exceedingly striking. There were dozens of poets to relate, memories of great men to be preserved, incidents and episodes to be recorded, and a pride of heroism to be glorified. Biographies followed fast upon each other, and called for others still, fixing in their rightful places the men of note; histories, too often *ex parte* in statement and partisan in spirit, were numerous, and no less readable because they defended a theory or a course of action; novels from which the antebellum antipathy had disappeared and short stories full of local color became fashionable; and poetry, sweetened and vitalized by sad experiences, became a daily solace. Back of this literary activity, however, loomed large and dreadful in the South the policies of reconstruction. To-day there are few, if any, apologists for this era of misguided zeal and humiliation that delayed and endangered a reunion which might well have come earlier.

**A Significant Date, 1876.**—This period ended in 1876, though its consequences could not cease so abruptly. This date does center in itself, however, certain very interesting signs that this period was practically at an end. In that year troops were withdrawn from Louisiana, the government of South Carolina passed from the hands of aliens into those of her own beloved chieftain, Wade Hampton. The people accepted not without murmur, but without violence, the decision of the electoral commission in Florida; and, as if all these signs of a reunion about to be focused on one spectacular exhibition, the Centennial celebration assembled people from all parts of our common country in the city of Brotherly Love.

**Second National Period, 1876.**—With this date the second national period began, and more than a generation has passed since of vital activities, high ideals, and magnificent efforts. Perhaps the most significant development has been

in education; and, of this in its higher reaches, Johns Hopkins, opened in 1876, may serve as a symbol. The growth of the literary spirit in our institutions may have not kept pace with the merely scholarly; but it is coming to its own, and in the meantime the whole country has felt the quickening power and enjoyed the self-sacrificing services of scholarship. Literature has found its course free, and its rewards more alluring, and, therefore, her votaries more numerous. But behind these fleet aspirants for flying fame plod worthy students doing their tasks more slowly and reaching results of more lasting value.

**Modern Types.**—The short story of local color and the historical novel, the chivalrous romance with its chain of marvelous coincidences, and purpose stories throbbing with the pressing problems of the day, have had wide popularity, for we are a nation of high-school readers. Histories have regained aplomb and poise, and essays of marked acumen and delightful finish are not rare. Oratory has cut for itself other channels, but is no less intensive and effective than of yore. Indeed, the new themes have called for a new type and method that is different from the old, but not inferior to it. The magazines are hospitable to poetry too, and, if the supply seems lacking in originality and primal excellence, it is not because our poets lack mastery of form, but because they have had no profound experiences to record.

**Promising Future.**—But all is promising. Education is widespread, scholarship has high ideals, literature has ample rewards for those who can win them, and our national spirit and pride strengthen day by day. Our first national period was from 1800 to 1850, with its most fruitful years in the second quarter of the century. It would not run counter to our present trend if the largest literary achievements of this century should fall in corresponding years.

His doctrines were ethical and political.	1000, Zoroaster. 776, First Olympiad. 753, Founding of Rome.

TABLE I. FROM THE BEGINNING TO THE BIRTH OF CHRIST—Continued

DATE	GREEK	LATIN	HEBREW	INDIAN AND PERSIAN	CHINESE	HISTORICAL EVENTS
1000 to 500 B.C. Cont.	<b>Sappho</b> .—One of the two greatest leaders of the <i>Ionian school</i> of lyric poetry. Passion, sincerity and grace in her work. <b>Anacreon</b> .—A graceful, lyric poet who sang of wine, love, and merry company.			<b>Laws of Manu</b> (In.)—A law-book and system of cosmogony. <b>Brhadamas</b> (In.)—Writings relating to prayer and sacrifices. <b>Upanishads</b> .—Speculations on the nature of the world and man.		586, Babylonian captivity.
500 to 400	<b>Findar</b> .—The greatest of the Greek lyric poets. <b>Æschylus, Sophocles, Euripides</b> .—Writers of tragedies. Their works are so full of deep human content that they belong to the world's greatest treasures. <b>Aristophanes</b> .—The greatest writer of Greek comedy. <b>Plato</b> .—The most important of the Athenian philosophers.		<b>Job</b> .—A drama of the soul. <b>Ruth</b> .—An idyl of Jewish life in the period of the judges.		<b>Mencius</b> .—Second in rank among Chinese sages. Taught that man by nature is good.	492, Persian war. 490, Marathon; age of Pericles. 438, Parthenon. 431-404, Peloponnesian war.
400 to 300	<b>Isocrates</b> .—The fourth among the ten Attic orators. <b>Demosthenes</b> .—A celebrated Athenian orator. <b>Æschines</b> .—An Athenian orator. <b>Aristotle</b> .—The founder of the Peripatetic school of philosophy. <b>Xenophon</b> .—An Athenian historian.		<b>Malachi</b> .—A minor prophet. <b>Daniel</b> .—The apocalyptic prophet. <b>Songs of Solomon</b> .—Hebrew pastoral poems.	<b>Paulin's Sanskrit Grammar</b> .—The greatest of India's grammarians. His is the oldest preserved Sanskrit grammar. Cuneiform inscriptions near Persepolis.		399, Execution of Socrates. 390, Gauls sack Rome. 336-323, Alexander the Great.
300 to 200	<b>Theocritus</b> .—The creator of bucolic poetry in Greek. <b>Erasthenes</b> .—Famous for astronomical, geographical and mathematical labors. <b>Apollonius</b> .—A Greek scholar and epic poet. <i>Septuagint version of Hebrew Scriptures</i> .—A translation made at Alexandria by seventy Greek scholars.		<b>Ecclesiastes, or Jesus, Son of Sirach</b> .—Practical moral reflections.	<b>The Puranas</b> (In.)—The name of a class of Hindu works of mixed cosmogonic, epic, and didactic character. Beginning of the Indian drama.		264-241, First Punic war. c. 229, Achaean league. 218-201, Second Punic war.
200 to 100 A.D.	<b>Homer</b> .—A Greek bucolic poet noted for his sharp and incisive sayings. <b>Moschus</b> .—Author of eight bucolic poems elegant in expression. <b>Polybius</b> .—One of the most important Greek historians.	<b>Plautus</b> .—Comedies: <i>Amulius, Captivi, Pseudolus</i> , etc.—Rich in humor and invention, his comic art rivals that of Shakespeare. Our modern drama owes much to him. <b>Facilius</b> .—A learned and able imitator of Greek literature. <b>Ennius</b> .— <i>Annales, Tragedies</i> , etc.—The writer of the first great Roman historic epic. He made the Latin language suitable for lofty poetry. <b>Tereus</b> .—Comedies: <i>Andria, Phormio</i> , etc.—His comedies are almost modern in their elegance, and have been widely copied by French and English dramatists. <b>Lucilius</b> .— <i>Satires</i> .—A daring satirist who spoke out his full meaning in language that was sometimes lofty and sometimes half-Greek and full of slang. <b>Cato the Elder</b> .— <i>Concerning Agriculture</i> .—At once a fine writer and a writer of strong works in prose. "The father of Latin prose." <b>Varro</b> .— <i>On Agriculture, On Languages</i> .—The most learned of the Romans. A great encyclopedist who wrote on various subjects with authority. <b>Cæsar, Julius</b> .— <i>Commentaries</i> .—At once a great statesman, writer, and historian. His work on the Gallic war is read in modern schools for its perfect style. <b>Cicero</b> .— <i>Orations, Essays, Letters</i> .—Rome's finest writer. The model of prose style for all time, ranging from lofty and powerful declamations to urbane and rhythmically beautiful passages. <b>Lælius</b> .— <i>Concerning Nature</i> .—The most original philosopher-poet in Latin. He espoused the Epicurean philosophy with an intensity of feeling that was almost madness. <b>Catullus</b> .— <i>Lyrics</i> .—In his strong passionate language the model of the modern Italian poet, d'Annunzio. <b>Sallust</b> .— <i>Histories: Catiline Conspiracy, War with Jugurtha, Memoirs</i> .—An accurate historian who wrote with clearness and vigor. <b>Nepos</b> .— <i>Histories, Biographies</i> .—Style is colloquial, but biographies are fair, sympathetic and well arranged. <b>Vergil</b> .— <i>Georgics, Æneid</i> .—The greatest of the Roman epic writers. His <i>Æneid</i> , partly imitated from Homer, is remarkable for its pathos and deep feeling. <b>Horace</b> .— <i>Odes, Satires, Letters</i> .—The most polished and the most quoted of all the lyric writers. No Roman poet is so long remembered as he, for he seems to exercise a personal influence over all who read him and came to him.	<b>Sudraka</b> .—An Indian dramatist.		146, Greece became Roman territory. 113-102, Invasion by Teutons. 63, Cicero consul. 49-45, Civil war. 44, Cæsar killed. 31, Battle of Actium. 27, Augustus emperor. 4, Birth of Jesus?	

TABLE II. FROM JESUS TO MOHAMMED, 1-400 A. D.

DATE	LATIN	EARLY CHRISTIAN LITERATURE—GREEK AND LATIN	GREEK	ORIENTAL	HISTORICAL EVENTS
A. D. 1 to 100	<b>Livy</b> (59 B. C.-17 A. D.).— <i>History of Rome</i> .—A florid, fluent historian, whose history of Rome was so long that part of it has been lost, inaccurate but very readable. <b>Seneca</b> (5 B. C.-65 A. D.).— <i>Tragedies, Moralists, Essays, Satires</i> .—Epigrammatic wit, rhetorical, he created a new and florid style.		<b>Josephus, Flavius</b> (37-100).— <i>History of the Jewish War, Jewish Antiquities</i> .—A Jewish historian who wrote in Greek in such pleasing style as to win the title of "the Greek Livy." His history gives a detailed account of the fatal war with Rome. <b>Plutarch</b> (c. 46-125).— <i>Lives, Morals, Table Talk</i> .—Master in sketching character. His work is permeated by lofty enthusiasm and a warmth of portraiture.		14, Death of Augustus. 68, Death of Nero.

TABLE II. FROM JESUS TO MOHAMMED—Continued

DATE	LATIN	GREEK	ORIENTAL	HISTORICAL EVENTS
1 to 100	<p><b>Orid</b> (43 B. C.-18 A. D.) <i>Metamorphoses, Heroides</i>, etc. A court poet who wrote much that is beautiful and much that is indecent. He died in exile.</p> <p><b>Pliny the Elder</b> (23-79).—<i>Natural History</i>. An encyclopedist who has left us a large work drawn from the writings of a multitude of other men. He died in the eruption of Pompeii.</p> <p><b>Lucan</b> (39-65 A. D.).—<i>Pharsalia</i>. The author of this third important Roman epic. He dared the displeasure of Nero and lost his life.</p> <p><b>Petronius</b> (—66).—<i>Satire</i>. The first writer of realistic literature. His work is remarkable for its knowledge of the world, brilliant criticisms, and its pictures of low life in Italy.</p> <p><b>Journal</b> (40-120). <i>Satires</i>.—A vigorous satirist of Roman life, depicting hideous vices and cauterizing them with words of fire.</p> <p><b>Quintilian</b> (45-110).—<i>Rhetoric and Criticism</i>. A genial writer on practical education, abounding in anecdotes and examples.</p> <p><b>Marital</b> (45-104).—<i>Epigrams</i>.—Very witty but obscene epigrammatist.</p> <p><b>Tacitus</b> (55-117).—<i>Germany, History, Annals</i>, etc. A scientific, historical writer, though prejudiced against the emperor. His style is obscure yet terse and vigorous.</p> <p><b>Pliny the Younger</b> (61-115).—<i>Epistles</i>. A rather self-conscious personage whose letters are written with one eye on the public at large. The facts he gives regarding his time make his epistles attractive reading.</p> <p><b>Suetonius</b> (72-c. 160).—<i>Lives of the Caesars, Lives of Eminent Grammarians</i>.—A voluminous writer, from whom we have the lives of the first twelve emperors. His style is dry but precise.</p> <p><b>Apuleius, Lucius</b> (c. 130).—<i>Golden Ass, Concerning Magic</i>.—Writer of romances who portrayed the life of his time with much humor and in life-like colors.</p>	<p><b>Epictetus</b> (c. 50).—<i>Discourses</i>.—An ascetic philosopher in exile, who led a life exemplary of the pure morals which he taught.</p> <p><b>Dion Chrysostomus</b> (c. 50-117).—<i>Orations</i>.—Though his writings have but little inherent value he is famous on account of the beauty of his style.</p> <p><b>Lucian</b> (c. 120-200).—<i>Dialogues of the Dead, Satires</i>.—A bold satirist who, fertile in invention and racy in humor, ridiculed the religion, philosophy and literature of his people.</p> <p><b>Apollonius</b> (c. 150).—<i>History of Rome</i>.—His point of view is purely religious but the work is invaluable for the history of the civil wars.</p>	<p><b>Kalidasa</b> (In).—<i>Drama</i>.—The most illustrious name in the second epoch of Sanskrit literature. This is the period of artificial poetry. Kalidasa is rich in creative fancy and strong in powers of description. His fame rests on his dramas, but he is also an epic and lyric poet. Toland began. This grant work is the encyclopedia of Jewish civilization.</p>	<p>70, Destruction of Jerusalem by Titus.</p> <p>79, Destruction of Pompeii by Vesuvius.</p> <p>96-117, Trajan.</p> <p>117-138, Hadrian.</p> <p>138-161, A. Pius.</p> <p>161-180, Marcus Aurelius.</p>
100 to 200	<p><b>Early Christian Literature</b></p> <p><b>New Testament, Justin Martyr</b>.—<i>Apologetics for the Christians</i>.—Important as defender of Christian religion. Was an ardent student of philosophy. Said to have been beheaded in 165 because he refused to sacrifice to heathen gods.</p> <p><b>Chrysostom</b>.—<i>Homilies, Commentaries, Epistles</i>.—An eloquent exponent of Christian doctrine.</p> <p><b>Clement of Alexandria</b>.—<i>Exhortation to the Greeks</i>.—A defense of the faith, designed to win converts.</p> <p><b>Tertullian</b> (c. 150-250).—<i>Apology, Tracts</i>. The creator of Christian Latinity. His works imprinted on Western theology a legalistic character which it never lost. Sharply attacked mortal laxities of his time.</p> <p><b>Origen</b>.—The greatest theologian of the third century. He developed the allegorical interpretation of scripture.</p>	<p><b>Galen</b> (c. 120-170).—A celebrated physician and prolific writer. Nearly every phase of medical science is indebted to him.</p> <p><b>Diocassius</b> (c. 150-235).—<i>History of Rome</i>.—Though a Roman senator he adopted Greek in his writings. The work is a model of digression.</p> <p><b>Ptolemy, Claudius</b>.—<i>Astronomy, Almagest</i>.—A famous mathematician, astronomer, and geographer. The last work still of interest, as it contains a catalogue of the stars.</p> <p><b>Herodian</b> (c. 170-c. 240).—<i>History of the Roman Empire</i>.—A sober, accurate and impartial historian.</p> <p><b>Plotinus</b> (c. 204-270).—<i>Enneads</i>.—A Greek philosopher characterized by depth of thought and purity of language.</p> <p><b>Longinus</b> (213-273).—A rhetorician so learned that he was called "a living library and a walking museum."</p> <p><b>Longus</b>.—<i>Daphnis and Chloe</i>.—This pastoral romance is considered the best of all ancient romances on account of its graceful narrative and deep, natural feeling.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p>	<p>Hau dynasty in China.</p> <p>226, New Persian empire.</p> <p>272, Defeat of Zenobia.</p> <p>273, Death of Plotinus.</p> <p>284, Reorganization by Diocletian.</p>
200 to 400	<p><b>Ausonius</b> (310-390).—<i>Mosellin</i>.—A Latin poet of Gaul in whom we first find the modern love of nature predominant. His best known poem is called <i>Mosella</i>, from the river Moselle; but he also dwelt on many subjects.</p> <p><b>Claudian</b> (c. 365-400).—<i>Raps of Proserpine, Epigrams</i>, etc. The last of the classical Latin poets. His poetical gifts were considerable, especially in the mastery of language and meter.</p>	<p><b>Athanasius</b> (c. 293-373).—<i>Discourses, Historia</i>.—The father of Greek orthodoxy.</p> <p><b>St. Ambrose</b> (c. 340-397).—A learned bishop noted for his mild and gentle, but indefeasible character.</p> <p><b>Jerome</b> (c. 340-420).—<i>Bible</i> (Vulgate).—This translation was destined to become the Bible of the occident.</p> <p><b>Prudentius</b> (c. 348-405).—<i>Hymns</i>.—The greatest of the early Latin Church. The <i>Hymns</i> were designed for devotional use.</p> <p><b>St. Augustine</b> (354-430).—<i>Confessions</i>.—Greatest of the Latin fathers. Taught that outside of the true church there could be no salvation.</p> <p><b>Fortunatus, Venantius</b> (c. 530-600).—<i>Hymns, Epitaphs, Epistles</i>.—The chief Latin poet of his time. The <i>Royal Banners Forward Go</i>, is his most famous hymn.</p> <p><b>Gregory the Great</b> (540-604).—<i>Exposition of Job, Dialogues</i>.—As a poet he was the great organizer of the ritual and public services of the Roman Church. One of the four greatest teachers of the Western church.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p>312, Edict of Milan by Constantine.</p> <p>361-363, Julian.</p> <p>376, Visigoths admitted.</p> <p>393, Death of Theodosius.</p> <p>410, Alaric sacks Rome.</p> <p>449, Saxons invade Britain.</p>
400 to 500	<p><b>Boethius</b> (470-525).—<i>Consolations of Philosophy, Translations</i>.—Almost the last Latin prose writer who also knew Greek. He ends the Roman period of literature with his philosophic treatises.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p>455, Vandals sack Rome.</p>
500 to 600	<p><b>Boethius</b> (470-525).—<i>Consolations of Philosophy, Translations</i>.—Almost the last Latin prose writer who also knew Greek. He ends the Roman period of literature with his philosophic treatises.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p><b>Completion of Palestine Talmud.</b></p> <p><b>GOTHIC</b></p> <p><b>Bishop Ulfilas</b> (c. 311-381).—<i>Gothic Bible</i>.—The earliest literary monument in Germanic speech, translated by the bishop of the Visigoths, and formed the basis of Arian Christianity for two centuries. One manuscript is preserved in the <i>Codex Argenteus</i> in Uppsala.</p> <p><b>Musurus</b>.—<i>Hero and Leander</i>.—A short epic of love. In its warmth of feeling it has touches that are almost modern.</p>	<p>527-565, Justinian.</p> <p>571, Death of Mohammed.</p> <p>590, Gregory becomes pope.</p> <p>593, Books printed in China.</p>

TABLE III. FROM MOHAMMED TO DANTE, 600-1300

DATE	ENGLISH	GERMAN	SCANDINAVIAN	ARABIAN, PERSIAN	HISTORICAL EVENTS
600 to 700	<b>Bede or Baede (673-735).—</b> <i>Ecclesiastical History, Poems</i> —Inspired by early Christian sentiment. <b>Cædmon (673?).—</b> <i>Paraphrase of Scripture</i> —Showing how strong an appeal the bible story made to the reverence of the race.	This is the period of the infiltration of Roman civilisation and Roman ideas.	400-1000, <i>Hundreds of Runic Inscriptions</i> (Dan.).—Very brief. Some in verse. Generally commemorative the dead. Very important for history, language, mythology. 400-1500, <i>About 2000 Runic Inscriptions</i> (Swed.).—Some authors known, as Uhir, Bah, Amundin, Krunau. About 160 are in poetic form. Important for history, language, art.	<b>Mohammed's Koran.</b> —The sacred book of Islam, collected shortly after his death. Many odes and lyrics in Arabic. <b>Bundeshah (Per.).</b> —Date very uncertain. A work on cosmogony and theology.	622, Flight of Mohammed from Mecca, the Hegira. 632, Death of Mohammed. Rapid spread of Mohammedanism. 687, Battle of Teutry.
700 to 900	<b>Traveler's Song (700?).</b> —Illustrates the sentiment of a wandering singer and the Anglo-Saxon's love of home. <b>Alcuin (735-804).—</b> <i>Letters, Biographies, Crus. Etc., Admonitions</i> —Friend of Charlemagne, wrote a comparatively pure Latin. <b>Cynewulf (c. 750-825).—</b> <i>Poems</i> —Serious poems of moral simplicity and power.	<i>Lay of Hildebrand, Wassabrunn Prayer, Muspilli</i> —All are in the old Germanic alliterative verse. Authors are unknown. The <i>Lay of Hildebrand</i> is an example of the rough, unsmooth ballad out of which the German national epic was, later, to be constructed.		In the latter half of this century Arabia enjoyed a glorious reputation in science and literature under the patronage of Haroun-al-Raschid. <b>Abu Hanifah (702-772).—</b> <i>Code of Laws</i> —Still in force in many parts of the Ottoman empire. <b>El-Ainval—Romance of Amor (Arab.).</b> —A long poem upon the poet Antara.	711, The Arabs enter Spain. 732, Arabs repelled at Tunes. 751, Pippin the Short, king of Franks.
900 to 990	<b>Alfred the Great (c. 846-901).—</b> <i>Translations</i> —Some original matter interpolated, e. g., narrative of others; versified by Langfellow.	<b>Orfild (c. 800-870).—</b> <i>Gospel Book</i> —A poetic version of the life of Christ, and like the <i>Heland</i> , doubtless intended to supplant the old heathen epic. <i>Heland (c. 830?)</i> —An alliterative epic in Old Saxon speech, treating the gospel account of the life of Christ.  Numerous religious writings, visions of judgment, lives of saints, epic gospel narratives, harmonies, and a few political compositions fill up the tenth century.	<b>Skalds (800-1100).—</b> <i>Dræpas</i> (i. e., vivid laudatory poems describing feasts and battles of contemporary Scandinavian and English rulers. Traveled from court to court. <b>Anonymous (850-200).—</b> <i>Elder (or poetic) Edda</i> (i. e.,) About 35 poems in alliterative verse dealing with myths (Odin, Thor, Frey) and hero legend (Sigfrid story). Composed in Iceland, Norway, Greenland; vivid, dramatic, terse.	<b>Al-Khifdi (c. 800).—</b> <i>Medicine, Astrology</i> (Arab.).—Remains of 200 works on science and philosophy. <b>Abu Ubaidah (824). (Arab.).—</b> <i>History</i> , in 105 monographs including histories of Mecca and Medina.	800, Charlemagne crowned emperor of the west. 809, Death of Haroun-al-Raschid. 814, Death of Charlemagne.
900 to 1000		<b>Eikehard—</b> <i>Lay of Walthar of Aquitaine</i> (c. 930)— <i>Waltharius manu forte</i> is a short epic in Latin hexameters describing the adventures of Hildebrand of Burgundy and of Waltharius as hostage at the court of Attila.  <b>Roswitha or Hrotswith.—</b> <i>Dramas</i> —A nun of Gandersheim who wrote six dramas in Latin in the Christian spirit of her time to take the place of the pagan plays of Terence.	<b>Egil Skallagrimsson (Ic.). (900 - 983).—</b> <i>Hilfudlau (Head-ransom); Sonarrætt, (Son-Laws)</i> —Dating straight-forward, original in expression. <b>Eyvind Skuldaspillir (Nor.). (c. 910-965).—</b> <i>Poem on King Hiden, Hildeyatal</i> —Is a fine poet and excellent man, but initiator of predeceases, whence his nicknames "destroyer of skulls." <b>King Harald Hargræ (Nor.). (933).—</b> <i>Sinsæfndardrapo</i> —Encouraged skaldic poetry and is said to have been a poet himself. <b>Thorbjörn Hornklofi (Nor.).—</b> <i>Poem on Harald Hargræ</i> Words. <b>Einar Helgason Skaldaglam (Ic.). (c. 945).—</b> <i>Yellala (Gold-wind)</i> —Powerful and exalted. Fine diction. Melodious verse. <b>Halfræd Vandradaskald (Ic.). (c. 970).—</b> <i>Poems on Varanus Chief</i> —Faithful, upright, but a bitter enemy. Fluent poet. Master of language and verse. <b>Sigrat Thordarson (Ic.). (995-1045).—</b> <i>Vikingspætur (Viking lays); Borgþingarsætur (Lays of Frankens)</i> —Greatest poet of days of Olaf the Holy. Tactful, discreet, honest, ease and elegance, etc.	<b>Budagi (—954). (Pers.).—</b> <i>Dizun</i> —Graceful, fluent lyrics. The first great poet of Mohammedan Persia. <b>Shu-Alrami (905). (Arab.).—</b> <i>Poems</i> —Lyrics and other types of verse.	843, Treaty of Verdun. 876, Treaty of Wedmore.
1000 to 1100	<b>Alfric (955-1020).—</b> <i>Homilies, Grammar</i> —Writings in Latin. A man of power and sincerity. During the tenth and eleventh centuries the Anglo-Saxon or English language was undergoing radical grammatical changes. The great authors of these two centuries wrote in Latin, it being intelligible to the learned, for whom they wrote.		<b>King Harald Hargræ (Nor.). (933).—</b> <i>Sinsæfndardrapo</i> —Encouraged skaldic poetry and is said to have been a poet himself. <b>Thorbjörn Hornklofi (Nor.).—</b> <i>Poem on Harald Hargræ</i> Words. <b>Einar Helgason Skaldaglam (Ic.). (c. 945).—</b> <i>Yellala (Gold-wind)</i> —Powerful and exalted. Fine diction. Melodious verse. <b>Halfræd Vandradaskald (Ic.). (c. 970).—</b> <i>Poems on Varanus Chief</i> —Faithful, upright, but a bitter enemy. Fluent poet. Master of language and verse. <b>Sigrat Thordarson (Ic.). (995-1045).—</b> <i>Vikingspætur (Viking lays); Borgþingarsætur (Lays of Frankens)</i> —Greatest poet of days of Olaf the Holy. Tactful, discreet, honest, ease and elegance, etc.	<b>Firdusi (c. 940-1020). (Pers.).—</b> <i>Book of Kings</i> —One of the foremost poets of all literature. A great epic dealing with the Persian monarchs. <b>Mutanabbi (965). (Arab.).—</b> <i>Dizun</i> —A series of poems. <b>Avicenna (980-1037). (Arab.).—</b> <i>Medicine, Philosophy</i> —Philosophical and scientific works. His work on philosophy has been a text-book for European universities.	962, Restoration of Holy Roman empire. 981, Greenland discovered.
	<b>William of Malmesbury (1090-1142).—</b> <i>History of Kings of England</i> —Of some value as an original. <b>Geoffrey of Monmouth (1154).—</b> <i>History of English Kings</i> —Largely legendary.	<b>Rudolf (c. 1030?)</b> —A Latin epic with novelties features, describing the life of the time. <b>William—</b> <i>Song of Solomon</i> —William Abbot of Eberbach in Bavaria, translated the <i>Song of Solomon</i> into German. <b>Ezsa—</b> <i>Lay of Eisa</i> —A scholastic of Bamberg whose <i>Lay</i> was to be sung as an anthem on the last great pilgrimage to the Holy Sepulchre before the crusades.	<b>King Harald Hargræ (Nor.). (933).—</b> <i>Sinsæfndardrapo</i> —Encouraged skaldic poetry and is said to have been a poet himself. <b>Thorbjörn Hornklofi (Nor.).—</b> <i>Poem on Harald Hargræ</i> Words. <b>Einar Helgason Skaldaglam (Ic.). (c. 945).—</b> <i>Yellala (Gold-wind)</i> —Powerful and exalted. Fine diction. Melodious verse. <b>Halfræd Vandradaskald (Ic.). (c. 970).—</b> <i>Poems on Varanus Chief</i> —Faithful, upright, but a bitter enemy. Fluent poet. Master of language and verse. <b>Sigrat Thordarson (Ic.). (995-1045).—</b> <i>Vikingspætur (Viking lays); Borgþingarsætur (Lays of Frankens)</i> —Greatest poet of days of Olaf the Holy. <p><b>Ben Jonson</b> (1574-1637).—<i>Dramas</i>—A scholar and man of letters. A learned constructor of plays, had also the true lyrical faculty.</p> <p><b>John Fletcher</b> (1576-1633).—<i>Francis Beaumont</i> (1596-1616).—<i>Dramas</i>—Well constructed plays, but of a low moral tone.</p> <p><b>Robert Burton</b> (1577-1640).—<i>Anatomy of Melancholy</i>—Full of out-of-the-way learning and quotations bearing on the subject.</p>	<p><b>Jacob Boehme</b> (1573-1624).—<i>Mysticism</i>—The founder of the mystical theosophy of the century.</p>	<p><b>Mathurin Régnier</b> (1573-1613).—<i>Satires</i>—His poems, few in number, are imitated from the ancients. He borrowed also considerably from the Italian satirists.</p>		<p><b>Gomes de Quevedo</b> (Sp.), (1580-1645).—<i>Satires</i>, <i>Tragedies</i>, <i>Novels</i>, <i>Poems</i>—Political and religious prose; humorous and satirical works.</p>	
<p><b>Robert Herrick</b>, (1591-1633).—<i>Poems</i>—Lyrics, many of them of charming quality and ingenious construction.</p>	<p><b>Johann Lauremberg</b> (1596-1658).—<i>Satirical Poems</i>—A patriotic satirist of the customs, language and dress of his time, especially of imitation of the French.</p>	<p><b>Hugo Grotius</b> (Dutch), (1563-1645).—<i>Law</i>, <i>Philosophy</i>, <i>Translations</i>—Famous scholar and statesman. Modest, pious, gentle, generous.</p>	<p><b>Anders Arrebo</b> (Dan.), (1587-1637).—<i>Poetic version of David's Psalms</i>, <i>Hexameron</i>—Flourish language. Good description of nature. Alexandrine, mythological references.</p>	<p><b>John Smith</b> (1580-1631).—<i>A True Relation of Virginia</i>—A romantic recital of thrilling adventures.</p> <p><b>William Bradford</b> (1580-1657).—<i>History of Plymouth Plantation</i>—A full and clearly written account to 1646.</p>	<p>1572. Massacre of St. Bartholomew.</p>
<p><b>George Herbert</b> (1593-1633).—<i>The Temple</i>—Inspired by a devotional spirit and an æsthetic spiritualism.</p>	<p><b>Friedrich von Spee</b> (1591-1635).—<i>Lyrics</i>—Von Spee and Johann Scheffler were exponents of the Catholic religious lyric.</p>	<p><b>Racine</b> (1589-1670).—<i>Pastoral Poems</i>—A poet full of a melancholy charm, highly appreciated by his contemporaries.</p>		<p><b>John Winthrop</b> (1590-1649).—<i>History of New England</i>—A simple, personal narrative, with occasional freshness of style.</p>	<p>1588. Defeat of the Spanish armada.</p>

TABLE V. SEVENTEENTH CENTURY—Continued

ENGLISH	GERMAN	FRANCE	SCANDINAVIAN	ITALIAN, SPANISH, PORTUGUESE	AMERICAN	HISTORICAL EVENTS	
<b>Isaac Walton</b> (1593-1633).— <i>The Complete Angler</i> .—From of a delightful character, full of simple piety and love of outdoor nature.		<b>Gues de Balzac</b> (1594-1654).— <i>Éloquent Prose</i> .—His somewhat rhetorical but elegant and harmonious style had an excellent influence on the progress of the language.	<b>Gustavus Adolphus</b> (Swed.), (1594-1632).— <i>Speeches, History, Hymns</i> .—Hero of Thirty Years' war. Intended to write also about his own life and reign, but did not get beyond Karl IX.				
	<b>Martin Opitz</b> (1597-1639).— <i>Criticisms, Translations, Poems</i> .—Translated from Greek, Latin and Italian, and set up fixed principles of poetic art. He has been called "the father of German poetry."	<b>René Descartes</b> (1596-1650).— <i>Philosophy</i> .—The founder of the school of philosophy, based upon reason, known under the name of <i>Cartesianism</i> . Besides being a great philosopher, Descartes made remarkable scientific discoveries.	<b>Georg Stiernhelm</b> (Swed.), (1598-1672).— <i>Western Languages, and Mathematica, Poems</i> .—Introduces a new period in literature. Earliest Swedish sonnets. Great linguist, great erudite poet.	<b>Calderón</b> (Sp.), (1600-1681).— <i>Dramas</i> .—Dramas with love, jealousy and honor as motives.	1600. Martyrdom of Giordano Bruno.		
<b>Sir Thomas Browne</b> (1603-1682).— <i>Pseudopythia, Theology</i> .—One of the most learned men of his time. His style exerted a great influence on Charles Lamb.	<b>H. M. Moscherosch</b> (1601-1690).— <i>Novels, Poems</i> .—Represents the transition from satire to novel under Spanish influence.	<b>Jean de Mairac</b> (1604-1665).— <i>Tragedies</i> .—His <i>Sophonisbe</i> and <i>Cleopatra</i> are the first tragedies adhering strictly to the unities.	<b>Lars Vivaldus</b> (Swed.), (1605-1669).— <i>Lyrics</i> .—Love of liberty and nature. Long imprisoned.		1603. England and Scotland united under James I.		
	<b>Friedrich von Logau</b> (1605-1635).— <i>Epigrams</i> .—This great epigrammatist wrote 3000 German epigrams. Some were translated by Longfellow.	<b>Pierre Corneille</b> (1606-1684).— <i>Tragedy, Comedy</i> .—Called the "Father of French tragedy." Among his tragedies but one is ranked among the masterpieces of the world's literature: <i>Le Cid, Horace, Cinna and Polyeucte</i> . He was also the author of the best comedy written until then (1642): <i>Le Menteur</i> .					
<b>Thomas Fuller</b> (1608-1661).— <i>Church History of England</i> .—A chronicle, with passages of wit or natural pathos.	<b>Paul Gerhardt</b> (1607-1676).— <i>Hymns and Poems</i> .—After Luther the greatest hymn-writer of the Lutheran church, and like Luther modeled his hymns on the popular ballads.	<b>Mlle. de Scudéry</b> (1607-1701).— <i>Novels</i> .—One of the leaders of the "Précieuses" and called by them the "Tenth Muse." She published a number of voluminous novels which contain many interesting allusions to the events of her days. The best known of these novels is <i>Artamène, ou le grand Cyrus</i> .			1607. Jamestown, Va. founded.		
<b>John Milton</b> (1608-1674).— <i>Areopagitica, L'Allegro, Il Penseroso, Comus, Paradise Lost, Paradise Regained</i> , etc.—A poet, grave, learned, of mental dignity but gifted with musical power as much as Shakespeare.		<b>Paul Sarrasin</b> (1610-1665).— <i>Comic Plays, Poems</i> .—Author of a number of witty, burlesque poems. His widow became the famous Madame de Maintenon.		<b>Antonio de Solis</b> (Sp.), (1610-1666).— <i>Conquest of Mexico</i> .—An eloquent spirited account of Cortes in Mexico.		1610, Galileo discovered Satellites of Jupiter.	
<b>Samuel Butler</b> (1612-1680).— <i>Hudibras</i> .—A rhyming jingle, destitute of elevation but with here and there a witty couplet. A classic Puritan throughout. A favorite book of Charles II.	<b>Andreas Gryphius</b> (1616-1664).— <i>Novels</i> .—The German Shakespeare of the seventeenth century. His best work is in his comedies.	<b>Francis de la Rochefoucauld</b> (1613-1690).— <i>Maxims, Memoirs</i> .—His maxims, full of bold paradoxes, give him a lasting reputation. He asserts that the love of self is the only motive for all human actions.	<b>Hallgrím Pjettersson</b> (Ic.), (1614-1674).— <i>Poems</i> .—Printed about 40 times. Clear revelations in a northern tongue of the spirit of reformation.		<b>Anne Bradstreet</b> (1612-1672).— <i>The Tenth Muse</i> .—As affected and cumbersome didactic poem.		
<b>Jeremy Taylor</b> (1613-1667).— <i>Holy Living, Holy Dying</i> , etc.—"The Shakespeare of Divines." Passages of rare poetic beauty and oratorical volume.							
<b>Richard Baxter</b> (1615-1691).— <i>Saint's Rest</i> .—One of the <i>Yoda</i> mummies of the later Puritans, earnest and sincere.	<b>Philipp von Zezen</b> (1619-1689).— <i>Novels</i> .—Showed original talent as translator of the novel of gallant adventure.	<b>Jean de la Fontaine</b> (1621-1695).— <i>Fables, Contes</i> , etc.—The <i>Contes</i> , inspired by Ariosto and Boccaccio, although full of wit are too often indecorous. The reputation of the poet rests on his remarkable <i>Fables</i> which won for him the surname of "The Inimitable."	<b>Stefan Olafsson</b> (Ic.), (1620-1688).— <i>Poems</i> .—Lyric, ironic, satirical, moralizing.			1618-38. Thirty Years' war.	
<b>John Evelyn</b> (1620-1706).— <i>Diary</i> .—Of inestimable value, as it covers seventy years of dramatic English history.	<b>Christoffel von Grimmelshausen</b> (1621-1669).— <i>Novels</i> .—The most important novelist of the period. <i>Simplicissimus</i> , the first great rogue novel in German literature, deals with the vicissitudes of the Thirty Years' war.	<b>Molière (Jean B. Poquelin)</b> (1622-1673).— <i>Comedies, Le Misanthrope</i> , etc.—The greatest writer of comedies not only of his time but of all times. He has not been equaled in France, perhaps not in any country, and he is placed by common consent among the great men of genius who belong to the world.					
		<b>Blaise Pascal</b> (1623-1662).— <i>Philosophy, Mathematica</i> .—Not only a great mathematician but also a thinker and a philosopher. His <i>Pensées</i> (Thoughts), though he did not finish enough to finish, and his <i>Lettres</i> remain as models of French literature.					

TABLE V. SEVENTEENTH CENTURY—Continued

ENGLISH	GERMAN	FRENCH	AMERICAN	HISTORICAL EVENTS
		<p><b>Mme. de Sévigné (1626-1696).</b>—<i>Letters</i>—Her charming familiar letters written to her daughter give interesting information on the court life of her time.</p> <p><b>Jacques Bossuet (1627-1704).</b>—<i>Sermons, etc.</i>—The greatest orator and the greatest writer of his time. reached absolute perfection of oratorical style.</p> <p><b>Charles Ferault (1626-1703).</b>—<i>Stories for Children</i>—His stories are known all over the world and have immortalized his name.</p> <p><b>Louis Bourdaloue (1632-1704).</b>—<i>Sermons</i>—A severe and austere preacher. The strength of his reasoning has made his sermons famous.</p> <p><b>Mme. de La Fayette (1634-1693).</b>—<i>Novels</i>—Replaces the bombastic style of the pastoral of the time by a real language.</p> <p><b>Nicolas Boileau (1636-1711).</b>—<i>Epistles, Art, Poétique, Satires</i>—These works stamp him as a real poet and as a great critic. He did much to elevate the literature of the century.</p> <p><b>Malebranche (1638-1715).</b>—<i>Philosophy</i>—Whatever may be the opinion of his theology, his rich and poetical style cannot be denied, and he is considered a great writer.</p> <p><b>Jean Racine (1639-1699).</b>—<i>Tragedy</i>—brought the French classic tragedy to its perfection. He understood men better than Corneille and consequently his tragedies are more human. It has been said that Racine painted men as they are, and Corneille as they should be.</p> <p><b>Jean de La Bruyère (1645-1696).</b>—<i>Character Studies</i>—Above all a moralist who in his <i>Characteres</i> satirized without mercy his surroundings.</p> <p><b>François de La Motte Fénelon (1651-1715).</b>—<i>Télémaque, etc.</i>—Was not equalled in his century for the charm of his style. Less vigorous than his rival Bossuet, the influence of his sermons and his religious works was not less great.</p> <p><b>Jean François Regnard (1655-1709).</b>—<i>Comedies in Verse</i>—His comedies, especially <i>Le Joueur</i>, show a decided comic talent.</p>		
		<p><b>SCANDINAVIAN</b></p> <p><b>Olof Rudbeck (Swed.) (1630-1702).</b>—<i>Atlantica, Works on Botany and Anatomy</i>—Very famous in anatomy. <i>Atlantica</i>, fanciful, represents the north as cradle of civilization.</p> <p><b>Feder Sjö (Dan.) (1631-1712).</b>—<i>Collection of Proverbs</i>—Promoted study and use of Danish instead of Latin. Wrote first Danish grammar.</p> <p><b>Thomas Kingo (Dan.) (1634-1703).</b>—<i>Hymns</i>—Denmark's most favorite hymn-writer and one of the world's best.</p> <p><b>Thorvald Torfæus (Ic.) (1636-1719).</b>—<i>History of Norway</i>—A revolutionizing history.</p> <p><b>Niels Stensen (Dan.) (1638-1686).</b>—<i>Mineralogy</i>—Finest work on subject ever written. Great student of anatomy.</p> <p><b>Lars Johansson (Swed.) (1638-1674).</b>—<i>Lyrics</i>—Drinking songs, songs of love, casual poems.</p> <p><b>Samuel Columbus (Swed.) (1642-1679).</b>—<i>Works on Grammar, Poems, Hymns</i>—Unusually melodious.</p> <p><b>Harin Spögel (Swed.) (1645-1714).</b>—<i>Glossarium Svedicobæum, Poems, Hymns</i>—Wrote <i>Gåde Verk och Hris</i>, religious, didactic poem. Best as writer of hymns.</p>	<p><b>ITALIAN</b></p> <p><b>Henry Norwood (1628-1670?)</b>—<i>A Voyage to Virginia</i>—Surprisingly well written in parts, and informative.</p> <p><b>Michael Wigglesworth (1631-1708)</b>—<i>The Day of Doom</i>—A poem on the day of judgment, according to the views of the time.</p>	<p>1625. Charles I., king of England.</p> <p>1628. Gustavus Adolphus killed at battle of Lützen.</p> <p>1634. Wallenstein assassinated.</p> <p>1642. English civil war.</p> <p>1649. Charles I. of England beheaded.</p> <p>1660. Restoration of the Stuarts.</p>
<p><b>John Bunyan (1628-1688).</b>—<i>Pilgrim's Progress, Holy War</i>—Simple, idiomatic, with passages of rare beauty. Animated by simple, natural piety. A classic too much neglected.</p> <p><b>John Dryden (1631-1700).</b>—<i>Virgil Translated, St. Cecilia's Day, etc.</i>—A fine critic. The father of fluent prose. Many energetic lines of verse, especially in his satires. A man of fine talent but limited genius.</p> <p><b>John Locke (1632-1704).</b>—<i>Essay on Human Understanding, Thoughts on Education, etc.</i>—A sound, practical thinker, whose works illustrate the common sense and unspiritual tone of his age.</p> <p><b>Samuel Pepys (1633-1703).</b>—<i>Diary</i>—His diary, not intended to be public, throws light on the life and habits of a capable business man of the eighteenth century.</p> <p><b>Str Isaac Newton (1642-1727).</b>—<i>Principia, etc.</i>—A great mathematician, he laid the foundation of our understanding of the mechanical structure of the universe.</p>	<p><b>Caspar von Lohenstein (1635-1683).</b>—<i>Drama, Novels</i>—Represents the decline of German Renaissance. Traveled in themes of blood, incest, and cruelty.</p> <p><b>Christian Weise (1642-1708).</b>—<i>Plays, Novels</i>—Schoolmaster poet of Zittau, wrote after the manner of the Latin school dramas. He marks an advance by introducing fresh characters from the life about him and employing an unutilized style.</p> <p><b>G. W. Lethnitz (1646-1710).</b>—<i>Philosophic Wirfungen</i>—The first great scientific German philosopher of the modern type, sought to reconcile spirit and matter. Chief works deal with the goodness of God, the liberty of man, the origin of crime, and his theory of monads, or atoms.</p> <p><b>Christian Thomasius (1655-1728).</b>—<i>First German Monthly</i>—Sought to bring universal enlightenment into the vernacular into close touch with national life. Delivered the first of university lectures ever given in the German tongue.</p>			

TABLE VI. EIGHTEENTH CENTURY, 1700-1800

ENGLISH	GERMAN	FRENCH	AMERICAN	ITALIAN, SPANISH, SCANDINAVIAN	HISTORICAL EVENTS
<b>Daniel Defoe</b> (1661-1731).— <i>Robinson Crusoe</i> —A born story-teller and pamphleteer.			<b>James Blair</b> (1656-1742).— <i>Sermons, No Cross No Crown</i> —Comparatively modern prose, written with pious zeal.		
<b>Jonathan Swift</b> (1667-1745).— <i>Tale of a Tub, Gulliver's Travels</i> —Un- equaled as a satirist and writer of allegories in simple, nervous, idiomatic English.		<b>Jean Massillon</b> (1663-1742).— <i>Orations</i> —One of the great French sacred orators. He lives in his <i>Petit Carême</i> .	<b>Cotton Mather</b> (1663-1728).— <i>Blay of Rev. Nathaniel Collins, Sermons</i> , etc.—Voluminous sentimental writings of "pedantic and fantastic quaintness."		
<b>Joseph Addison</b> (1673-1719).— <i>Essays</i> —Originator of the social essay, marked by kindly, gentlemanlike humor in the urbane style.		<b>Aleais René Le Sage</b> (1668-1747).— <i>Gil Blas, Comedies</i> —Best known as the author of <i>Gil Blas</i> , a satirical novel, and the first one to depict truly the manners of society.		<b>G. Battista Vico</b> (It.), (1668-1744).— <i>Scienza Nuova</i> —Metaphysical and scientific.	
<b>Sir Richard Steele</b> (1672-1729).— <i>Essays</i> —Established the <i>Tatler</i> . A good second to Addison.			<b>William Byrd</b> (1674-1744).— <i>The Dying Lane and other tracts</i> —Full of fresh humorous observations on life.		1665. Great fire of London.
	<b>Christian von Wolff</b> (1679-1754).— <i>Philosophical Writings</i> —The modern scholastic who popularized philosophy and brought rationalism to bear upon theology.	<b>Duc de Saint Simon</b> (1675-1755).— <i>Memoirs</i> —An original and powerful writer whose memoirs are a rich mine for those who study the period in which he lived.	<b>Robert Beverly</b> (1675-1716).— <i>History of Virginia</i> —A straightforward narrative of slightly polemic purpose.	<b>Scipione Maffei</b> (It.), (1675-1755).— <i>Dramas</i> —His <i>Mezope</i> is the first classic Italian tragedy.	1675. Greenwich observatory founded.
<b>Bishop Berkeley</b> (1684-1753).— <i>Philosophy</i> —A very acute thinker, English founder of one form of idealism.		<b>Philippe Destouches</b> (1680-1754).— <i>Comedies in Vers</i> —His <i>Le Glorieux</i> is an excellent comedy of manners and the best of his plays.		<b>Ludvig Holberg</b> (Dan.), (1684-1754).— <i>Comedies, Historical Works, Philosophy, Comic Poetry</i> —Founder of Danish drama. Satirical comedy. Natural language of daily life. Fine picture of Copenhagen life.	
<b>Alexander Pope</b> (1686-1744).— <i>Poems</i> —The model poet of his time and century. Imparted to the couplet vigor, pungency, and some variety.			<b>Emanuel Swedenborg</b> (Swed.), (1686-1772).— <i>Philosophy</i> —Prominent seer. Founder of religious sect with adherents chiefly in England and America.		1688. English revolution.
<b>Samuel Richardson</b> (1689-1761).— <i>Novels: Clarissa Harlowe, Pamela, Sir Charles Grandison</i> —Founder of the sentimental moral novel, and gifted with the story-telling faculty.		<b>Aleais Firou</b> (1689-1773).— <i>Comedies in Vers</i> —The many superior qualities displayed in his poetical works are spoiled by the licentious nature of some of them. His best comedy <i>La Métempsé</i> , is one of the masterpieces of the French theater.			
<b>Bishop Butler</b> (1692-1752).— <i>Natural and Revealed Religion</i> —The orthodox moralist of his day, ponderous in style and common-place in method.	<b>J. C. Guenther</b> (1695-1723).— <i>Leyce</i> —A lyric poet of personal feeling, modeling his lyrics upon the ballad, and thus the forerunner of Goethe.	<b>Voltaire (François Marie Arouet)</b> (1694-1778).— <i>History, Letters, Philosophy, Poems, Dramas</i> , etc.—The greatest literary genius of the eighteenth century. Poet, historian, political and satirical writer, philosopher, writer of tragedies, he excelled in every branch of literature. His works fill from 75 to 80 volumes.		<b>H. A. Brorson</b> (Dan.), (1694-1764).— <i>Hymns</i> —Wrote some of the best Danish hymns.	
<b>Henry Carey</b> (1700-1743).— <i>Poems; Sally in Our Alley</i> , etc.—A light gift of doggerel nature.	<b>J. Bodmer</b> (1698-1783).— <i>Criticism, Translations</i> —Attacked Gottsched for subordinating the poet's imagination to the understanding, and finally wrought the latter's downfall.			<b>Pietro Metastasio</b> (It.), (1698-1782).— <i>Musical Dramas</i> —Lyric smoothness of melody.	1697. Peace of Ryswick.
<b>James Thomson</b> (1700-1748).— <i>The Seasons</i> , etc.—A delicate feeling for the quieter aspects of nature, harmoniously expressed.	<b>J. C. Gottsched</b> (1700-1766).— <i>Dramas, Criticism</i> —For twenty years literary dictator in Leipzig, sought to reform the German drama on the model of the French, but insisted upon historic costume, and banished the clown from tragedy.		<b>Jonathan Edwards</b> (1703-1766).— <i>Sermons, Surprising Conversions</i> , etc.—Strong and highly imaginative proclamations of Calvinism.	<b>Ignacio de Llanos</b> (Sp.), (1704-1789).— <i>Art of Poetry, Poems</i> —Helped introduce French influence in Spanish.	
		<b>Benjamin Franklin</b> (1706-1790).— <i>Poor Richard's Almanac, Autobiography</i> —Wise and sagacious utterances of a fair, avowed utilitarian.		<b>Finn Jonsson</b> (Ic.), (1704-1789).— <i>Revised History of Iceland</i> —Last of royal dynasties. History up to 1740.	1704. Boston New Letter established.

TABLE VI. EIGHTEENTH CENTURY—1700 to 1800—Continued

ENGLISH	GERMAN	FRENCH	SCANDINAVIAN	ITALIAN, RUSSIAN	HISTORICAL EVENTS
<b>Henry Fielding</b> (1707-1754).— <i>Tom Jones, Amelia, Jonathan Wild</i> , etc.—The first great realistic novelist. Depicts life broadly and faithfully.		<b>Comte de Buffon</b> (1707-1788).— <i>Natural History</i> .—A great naturalist and a writer whose style still serves as a model.	<b>Karl von Linné</b> (Swed.) (1707-1788).— <i>Botany, Travels</i> .—Founder of science of botany. Language is naive, expressive, simple, clear.	<b>Carlo Goldoni</b> (It.), (1707-1793).— <i>Comedies</i> .—Animated character comedy, mostly in prose.	
<b>Samuel Johnson</b> (1709-1784).— <i>Dictionary</i> .— <i>Rasselas, Lives of the Poets, Vanity of Human Wishes</i> .—A man great in eighteenth century learning and letters. The critical authority of his day.	<b>Friedrich von Hagedorn</b> (1709-1754).— <i>Anacreontic Lyrics, Fables</i> .—Essentially a social poet. He gives the dominant tone to the German lyric for twenty-five years.	<b>Louis Gresset</b> (1709-1777).— <i>Poems, Comedies</i> .— <i>Vertigier</i> , a popular poem, and <i>Le Méchant</i> , a comedy, are the best known of his works.	<b>Olof von Dalin</b> (Swed.), (1708-1769).— <i>Journalist, History, Comedies, Tragedies, Poems</i> .—Representative beginning of era of French influence. Shows influence of Pope, Addison, Swift, Voltaire.	<b>Prince Antioch Kanemir</b> (Russ.), (1708-1744).— <i>Forme</i> .—Bold satirist of the social life of his own people. Verse form under French influence.	1708. Battle of Oudenarde.
<b>David Hume</b> (1711-1776).— <i>History of England</i> .—The first learned historian of England. A philosopher of science.	<b>Albrecht von Haller</b> (1708-1777).— <i>Science, The Alps</i> .—Great Swiss anatomist and physiologist. Came under the influence of English poets and wrote <i>The Alps</i> in the spirit of the English nature poetry.	<b>Jean Jacques Rousseau</b> (1712-1778).— <i>Fiction, Education</i> .—The world-wide influence of the works of this man cannot be measured.	<b>Dezire Diderot</b> (1713-1784).— <i>Fiction, Encyclopédie</i> (Ed.).—One of the most powerful exponents of the ideas and philosophy of the eighteenth century.	<b>Michail Lomonossov</b> (Russ.), (1711-1765).— <i>Lyrics</i> .—Scholar and poet. Founder of Russian metrics. Grounded in Russian folk-song.	1710. St. Paul's cathedral, London, completed.
<b>Laurence Sterne</b> (1713-1768).— <i>Tristram Shandy, Sentimental Journey</i> .—A writer in whom affection becomes an art. Some pathetic passages have become classic.		<b>Etienne de Condillac</b> (1715-1780).— <i>Metaphysics</i> .—A friend of Rousseau and Diderot, and, as a philosopher, for a long time a disciple of Locke. His <i>Traité on Sensations</i> put him at the head of the "Sensualists" school.			1717. Alliance between France, England and Holland.
<b>Thomas Gray</b> (1716-1771).— <i>Elegy in a Country Churchyard</i> , etc.—A scholar-poet. Production limited but of fine workmanship.	<b>C. F. Gellert</b> (1715-1779).— <i>Novels, Letters, Poems</i> .—A poet of the people. Great stylist as letter writer. His Swedish <i>Countess of G.</i> is the first novel written in Germany.	<b>Ewald von Kietel</b> (1715-1759).— <i>Nature Poetry, War Odes</i> .—A Prussian military officer. Influenced in his poetry by Thomson. A spirit of melancholy unites with his passionate love for nature.			
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.	<b>J. J. Winckelmann</b> (1717-1768).— <i>History of Ancient Art</i> .—His work opened a new epoch in the history of art, and marked the beginning of modern archaeology as a branch of science.	<b>Ernst von Kietel</b> (1715-1759).— <i>Nature Poetry, War Odes</i> .—A Prussian military officer. Influenced in his poetry by Thomson. A spirit of melancholy unites with his passionate love for nature.			
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.	<b>J. W. L. Gleim</b> (1717-1803).— <i>Anacreontic Lyrics, Grenadier Songs</i> .—A mediocre poet of love and wine and of war-songs, best known as a generous patron of needy poets.	<b>Jean François Marmontel</b> (1723-1799).— <i>Novels, Tragedies</i> .—Also a noted encyclopedist.	<b>Gerhard Suhm</b> (Nor.), (1722-1780).— <i>History of Norway</i> .—Wrote a work on the north to 1400 in 14 volumes.	<b>Carlo Gozzi</b> (1722-1806).—Italian dramatist.	
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.	<b>F. G. Klopstock</b> (1724-1803).— <i>Messiah, Lyrics, Odes</i> .—The first genuine poet of the eighteenth century. Inspired by Milton's <i>Paradise Lost</i> , he wrote his <i>Messiah</i> . He was also a great lyric poet.		<b>Björn Halderson</b> (Ic.), (1724-1794).— <i>Dictionary</i> .—Originally an Icelandic-Latin dictionary, but published for the first time in 1814 with Danish meanings by R. Hask.		
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.	<b>G. E. Lessing</b> (1729-1781).— <i>Criticism, Plays</i> .—The greatest critic of Germany. Turned the minds of the Germans from the French stage to Shakespeare and German folk-drama. Introduced the English comedy of common life, developed a new type of national German tragedy, and preached the evangel of brotherhood and religious toleration.		<b>F. F. Suhm</b> (Dan.), (1728-1798).— <i>History of Denmark</i> .—In 14 volumes ending with the year 1400. Characteristic ponderousness of age.		
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.			<b>C. R. Tullin</b> (Nor.), (1728-1780).— <i>Poems</i> .—Poems describing nature and didactic poems. Influenced by Thomson and Pope. Too much detail in description.		
<b>John Smollett</b> (1721-1771).— <i>Humphrey Clinker, Roderick Random</i> , etc.—Originator of the sea-story. Inclined to vulgar coarseness.				<b>Giuseppe Parini</b> (It.), (1729-1799).— <i>Poems, Odes</i> .—His <i>Giorno</i> is one of the best works in Italy in the eighteenth century.	1727. George II. king of England.

TABLE VI. EIGHTEENTH CENTURY—Continued

ENGLISH	GERMAN	FRENCH	SCANDINAVIAN	ITALIAN, SPANISH, RUSSIAN, AMERICAN	HISTORICAL EVENTS
<b>William Cowper</b> (1731-1800).— <i>The Task, John Gilpin</i> , etc.—Diverts poetry of the affections of Pope. Writes on simple themes.	<b>Solomon Gessner</b> (1730-1788).— <i>Idylls, Pastorals</i> .—His <i>Idylls</i> the most popular German book in Europe before the appearance of <i>Werther</i> . His prose is delicately halcyon, but very artificial.	<b>A. de Beaumarchais</b> (1732-1799).— <i>Comedies</i> .—Celebrated especially for his two witty and well constructed plays, <i>Le Barbier de Séville</i> and <i>Le Mariage de Figaro</i> , in which we find much of the spirit that is coming with the French revolution.	<b>Gustav Filip Creutz</b> (Swed.), (1731-1785).— <i>Poems</i> .—Idyllic poetry. Tender in personality and expression. Delights of nature and of love.	<b>Girolamo Tiraboschi</b> (It.), (1731-1794).— <i>Literary History</i> .—A valuable history of Italian literature.	
	<b>C. M. Wieland</b> (1733-1813).— <i>Novels</i> .—Best known as author of the novels <i>Don Sylvio</i> of describing his transition from pietism to nature poetry; <i>Agathon</i> , giving his views of the antique; and the metrical romance <i>Oberon</i> , treating of the adventures of Hagen of Bordeaux.		<b>Gustav Fredrik Gyllenberg</b> (Swed.), (1731-1808).— <i>Poems</i> .—Best in didactic and satirical poetry. Wrote also fables and an epic.	<b>Ramón de la Cruz</b> (Sp.), (1731-1799).— <i>Dramas</i> .—Short farces of everyday life.	
	<b>Immanuel Kant</b> (1724-1804).— <i>Critical Philosophy</i> .—The greatest German philosopher. Substituted critical philosophy for the old dogmatic metaphysics, demanded obedience to the moral law, laid the foundations of modern aesthetics. He was the founder of the transcendental philosophy.	<b>Bernardin de St. Pierre</b> (1737-1814).— <i>Paul and Virginia</i> . This popular work brings into French literature the taste for "nature" as it is. St. Pierre was in literature a disciple of J. J. Rousseau.		<b>George Washington</b> (1732-1799).— <i>Farwell Address, State Papers</i> , etc.—Broadly patriotic and well-considered.	
<b>Edward Gibbon</b> (1737-1794).— <i>Decline and Fall of the Roman Empire</i> .—A painstaking and learned historian. Constructive powers of broad scope.				<b>Thomas Godfrey, Jr.</b> (1736-1768).— <i>The Prince of Parthia, Poems</i> .—Imitative but original in imagination and marked by color.	1734. University of Göttingen founded.
<b>James Boswell</b> (1740-1795).— <i>Life of Samuel Johnson</i> .—The true reporter's instinct for the point of a story. Otherwise a lousy.				<b>Patrick Henry</b> (1736-1799).— <i>Speeches, Letters</i> , etc.—Eloquent, ardent, and profoundly impressive.	
<b>William Paley</b> (1743-1805).— <i>Evidence of Christianity, Natural Theology</i> .—A cogent reasoner on the old premises.	<b>J. G. von Herder</b> (1744-1803).— <i>History</i> .—The chief factor in the literary revolution known as "naturalism." His work in history sets forth the evolution of human institutions.		<b>Karl Mikael Bellman</b> (Swed.), (1740-1795).— <i>Songs, Lyrics</i> .—Bubbling joy of life. Fluent writer. Wrote just to amuse. Musical. Very popular.	<b>Thomas Paine</b> (1737-1809).— <i>The Crisis, Common Sense, Rights of Man, Age of Reason</i> , etc.—Journalistic and talented, and generally effective.	
<b>Hannah More</b> (1745-1833).— <i>Coleridge in Search of a Wife, Sacred Dramas</i> .—Something of a minor poet, something of a dramatist and story-teller.			<b>J. M. Wessel</b> (Nor.), (1742-1785).— <i>Poems, Plays</i> .—Effective parody of dramas of the day, which were written in French style. Elegant language. <i>Love Without Sins</i> is his best known work.	<b>Gabriel Doroshawin</b> (Russ.) (1748-1816).— <i>Lyrics, Odes</i> , etc.—His ode <i>To God</i> translated into all European languages. Rhetorical but a strong poetic vein.	1740. Reign of Frederick the Great begins.
<b>Jeremy Bentham</b> , (1748-1832), <i>Philosophy, Essays</i> .—Greatest critic of legislation and government in his day.	<b>Johann Wolfgang von Goethe</b> (1749-1832).— <i>Dramas, Lyrics, Elegies, Sonnets, Epigrams</i> .—The greatest German poet. A universal genius. Before 1800 he had imitated Shakespeare, Ossian, Goldsmith and the ballad poetry, sung ode in the manner of Pindar and Klopstock, lived his story of <i>Werther</i> , and created a new German classicism in <i>Phigorie, Tasso</i> , and <i>Herzmann and Dorothea</i> . His life poem, <i> Faust</i> , is based upon the doctrine of redemption by ceaseless striving, and typifies the philosophical struggle of the poet's own life.	<b>Comte Mirabeau</b> (1749-1791).— <i>Orations</i> .—The greatest orator of the French revolution. His speeches have been published and are his principal title to literary distinction.	<b>Klaus Fasting</b> (Nor.), (1746-1791).— <i>Poems</i> .—Famous for critical essays and epigrams. Admired of French literature.	<b>Vittorio Alfieri</b> (It.), (1749-1803).— <i>Tragedies</i> .—Classical in spirit, observing the unities.	
<b>Richard B. Sheridan</b> , (1751-1816), <i>The Rivals, School for Scandal, Speeches</i> , etc.—Writer of witty dialogue and constructor of telling stage situations. Comedy still acted.	<b>William Blake</b> , (1757-1827), <i>Songs of Innocence, Songs of Experience</i> .—The single Englishman of supreme and simple poetic genius of his time.		<b>Edw. Storm</b> (Nor.), (1749-1794).— <i>Poems</i> .—Author of splendid heroic ballads.	<b>Tomás de Iriarte</b> (Sp.), (1750-1791).— <i>Literary Fables</i> .—Original fables directed toward literary subjects.	
<b>Robert Burns</b> , (1759-1796), <i>Poems</i> .—Lyrics, songs and satires in Scotch dialect, marked by music, pathos and wit.	<b>Friedrich von Schiller</b> (1759-1805).— <i>Drama, Lyrics, History</i> .—The great associate of Goethe. Reflects the ideal yearning of his time. Aimed to lead men to consecrate their gifts to the good, the beautiful, and the true. He is the best-loved poet among the Germans.	<b>Claude Bouquet de Laube</b> (1760-1826).— <i>Mercure, lais</i> .—The immortal national hymn of France.	<b>Johan Henrik Kellgren</b> (Swed.), (1751-1795).— <i>Journalism, Poems, Lyrics</i> and satiric poetry. Most prominent of the literary men who were intimate with Gustaf III.		1755. Earthquake at Lisbon.
	<b>A. von Katschube</b> , (1761-1819).— <i>Plays</i> .—Now almost forgotten, he was the most popular dramatist of his time. His plays are very numerous, and catered to the public taste.	<b>André Chénier</b> (1762-1794).— <i>Lyrics</i> .—A model in purity of form. His style in the lyrics is passionate, but not personal.	<b>Enoch Falen</b> (1755-1808).— <i>Dramas</i> .—His <i>Drogaden</i> enjoyed great popularity.		1756-1763. Seven Years' war.
					1759. Battle of Quebec.

ENGLISH	AMERICAN	FRENCH
<p><b>Maria Edgeworth</b> (1767-1849).—<i>Popular Tales</i>—Stories of middle-class domestic life, of excellent moral tone and some power of characterization.</p>	<p><b>Thomas Jefferson</b> (1743-1826).—<i>Notes in Virginia, Declaration of Independence</i>—Full of wise foresight and keen acumen.  <b>John Marshall</b> (1755-1835).—<i>Life of Washington, Decisions</i>, etc.—Profound and wise, but rather heavy.  <b>Alexander Hamilton</b> (1757-1804).—<i>Contributions to the Federalist</i>—Keen and ingenious, full of information.</p>	<p><b>Xavier de Maistre</b> (1763-1852).—<i>Novels, Essays</i>—Models of vigorous narration. Deserves prominent place among French novelists.  <b>Mme. de Staël</b> (1766-1817).—<i>L'Allemagne, Delphine, Germany</i>, etc.—The first to set forth the principles of the Romantic school. Her book on Germany did much to bring the thought of that country into France.  <b>Benjamin Constant</b> (1767-1830).—<i>Politics, Religion</i>—His works, both on politics and religion, are skeptical in tone. He also wrote <i>Adolphe</i>, a novel of some value.  <b>Jean François Micaud</b> (1767-1839).—<i>History of the Crusades</i>, etc.—The founder of the universal biography.</p>
<p><b>William Wordsworth</b> (1770-1850).—<i>The Excursion, Poems</i>—Nature poems and descriptive poems. Many fine sonnets. First expression of modern feeling for nature.  <b>James Hogg</b> (1770-1835).—<i>Pastorals, Shepherd's Calendar</i>—Scottish verses. One or two lyrics of sweetness and simplicity.  <b>Sir Walter Scott</b> (1771-1832).—<i>Novels, Lady of the Lake, Poems</i>—Originator of the historical novel. Tone natural and wholesome. Secure in the estimation of posterity.  <b>Sidney Smith</b> (1771-1845).—<i>Sermons, Essays</i>—The witty divine. Master of the expository style.  <b>James Montgomery</b> (1771-1854).—<i>Hymns, Poems</i>—A man universally esteemed; best remembered now for his hymns, of which some hundred are found in our hymnals.  <b>Samuel T. Coleridge</b> (1772-1834).—<i>Essays, Hymns of Ancient Mariner, Translation</i>, etc.—A man of remarkable gifts, intellectual and poetic; a keen critic; a natural master of verbal melody.</p>	<p><b>Charles Brockden Brown</b> (1771-1816).—<i>Wieland, Ormond</i>, etc.—Weird and sensational, of the Godwin type.</p>	<p><b>François de Chateaubriand</b> (1768-1848).—<i>Reus, Genesis of Christianity, Atlas</i>, etc.—Undoubtedly the greatest writer of his century, and his influence on the literature of the first half of the nineteenth century is considerable.  <b>Baron de Cuvier</b> (1769-1832).—<i>Natural History</i>—One of the best known French naturalists.  <b>Napoleon I.</b> (1769-1821).—<i>Proclamations, Letters, Memoirs</i>—His letters and his memoirs bear the stamp of the great genius whose characterization cannot be given in this restricted space.</p>
<p><b>Robert Southey</b> (1774-1843).—<i>Biographies of Nelson, Wesley</i>, etc., <i>Poems</i>—A man of industry and worth. Better as a prose stylist than a poet.  <b>Charles Lamb</b> (1775-1834).—<i>Essays of Elia</i>, etc.—A quaint and delicate essayist; a friend of Coleridge.  <b>Walter Savage Landor</b> (1775-1864).—<i>Imaginary Conversations, Count Julian, Heron, Iphigene</i>, etc.—Charming scholar and writer. Lhecture and old-fashioned in his thought but a remarkable stylist.  <b>Jane Austen</b> (1775-1817).—<i>Novels; Pride and Prejudice, Emma</i>, etc.—Her novels depicting upper middle-class life are delightfully realistic and full of quiet humor.  <b>Thomas Campbell</b> (1777-1844).—<i>Pleasures of Hope, Lyrics</i>, etc.—Something of a critic. His lyrics have much vigor and verve.  <b>Henry Hallam</b> (1777-1859).—<i>Europe During the Middle Ages, Constitutional History of England</i>—Strong, vigorous, historical writing from a standpoint now antiquated.  <b>William Hazlitt</b> (1778-1830).—<i>Table Talk, English Poets</i>, etc.—Critical essays; contain some true eloquence, and many powerful phrases.</p>	<p><b>Robert Treat Paine</b> (1773-1811).—<i>Adams and Liberty, Poems</i>—Superficial but of noticeable metrical facility.</p>	<p><b>Charles Fourier</b> (1772-1839).—<i>Socialism</i>—A socialist whose system did not prove practical although it had many followers.</p>
<p><b>Thomas Moore</b> (1779-1852).—<i>Biographies, Lalla-Rookh, Irish Melodies</i>, etc.—Songs of much melody but of an unreal sentimentality.</p>	<p><b>Henry Clay</b> (1777-1852).—<i>Speeches, Letters</i>, etc.—Attractive because of personality and power.  <b>Washington Allston</b> (1778-1843).—<i>Art Lectures, Poems</i>—Highly artistic in intent and achievement.  <b>James Kirk Paulding</b> (1779-1860).—<i>Novels—Romances of little present interest.</i>  <b>Francis Scott Key</b> (1780-1843).—<i>Poems, Star Spangled Banner</i>, etc.—The chief poem is a national song of patriotic ardor.  <b>William F. Channing</b> (1780-1842).—<i>Addresses, Sermons</i>—Social papers, clear, tolerant, thoughtful.  <b>John James Audubon</b> (1780-1851).—<i>Birds of America, Quadrupeds of America</i>—Marked by keen observation and wide interest.</p>	<p><b>Jean Baptiste Biot</b> (1774-1862).—<i>Philosopher and mathematician.</i>  <b>Pierre de Béranger</b> (1780-1857).—<i>Lyrics</i>—His songs, which have great lyric qualities, were very popular in his day and are still valued.</p>

CENTURY, 1800-1900

GERMAN	SCANDINAVIAN	ITALIAN, SPANISH, RUSSIAN	HISTORICAL EVENTS
<p><b>J. G. Fichte</b> (1782-1814).—<i>Philosophic Writings, Orations</i>.—The philosopher of the Romantic school and the exponent of the philosophy of individualism. His great work <i>Addresses to the German Nation</i> helped arouse the revolt against Napoleon.</p> <p><b>Jean Paul Friedrich Richter</b> (1763-1825).—<i>Novels, Eschairs</i>.—United elements of "storm and stress" with Fichte's philosophy. Often represents the idealist in conflict with real life.</p> <p><b>Wilhelm and Alexander von Humboldt</b> (1767-1825 and 1769-1859).—<i>Criticism, Science, Travel</i>.—Great scientists and travelers. Wilhelm, virtual founder of the University of Berlin, was a great classical scholar. Alexander wrote the great masterpiece <i>Cosmos</i>.</p> <p><b>A. W. von Schlegel</b> (1797-1845).—<i>Criticism, Poems</i>.—The great critic of the Romantic school. Gave the Germans his famous lectures on <i>Dramatic Art and Literature</i>, and contributed to their classical translation of Shakespeare, 1797-1810.</p> <p><b>Zacharias Werner</b> (1768-1825).—<i>Plays, Sonnets</i>.—Next to Tieck, the greatest dramatist of the Romantic school.</p> <p><b>F. E. D. Schlegel</b> (1796-1834).—<i>Addresses, Criticism</i>.—The preacher of the Romantic school, famous for his <i>Addresses on Religion</i>, his <i>Monologues</i>, and his <i>Lectures on Lucinde</i>.</p> <p><b>Ernst Moritz Arndt</b> (1769-1860).—<i>Warsongs, Lyrics</i>.—A sturdy patriot. An earnest, religious spirit pervades his work. Most effective in stirring his nation to revolt against Napoleon.</p> <p><b>Friedrich Hebel</b> (1770-1843).—<i>Hyperion, Lyrics</i>.—Devoted to Greek culture. Poetic activity early cut off by insanity. Was the most gifted lyric genius at the close of the century.</p> <p><b>G. W. F. Hegel</b> (1770-1831).—<i>Philosophy</i>.—The philosopher of collectivism and of evolution in history.</p> <p><b>Heinrich Heine</b> (1771-1845).—<i>Novels</i>.—Prolific novelist, social and political reformer. His best novels are written in the spirit of Scott's <i>Waverley Novels</i>.</p> <p><b>Novalis (Friedrich von Hardenberg)</b> (1772-1801).—<i>Novels, Lyrics, Criticism</i>.—The sentimental poet of the Romantic school. His <i>Hymns to the Night</i> contain some of the most spiritual poetry in the German tongue.</p> <p><b>Friedrich von Schlegel</b> (1772-1825).—<i>Criticism, Novels</i>.—Both critic and poet and wrote the greatest novel of the Romantic school, entitled <i>Lucinde</i>, dealing with the limitations of conventional society.</p> <p><b>J. L. Tieck</b> (1773-1853).—<i>Novels, Lyrics</i>.—The most prolific writer of the Romantic school. His <i>Puss in Boots</i> is the best satirical German drama. He is unrivaled in the world of fantasy.</p> <p><b>F. N. J. Schelling</b> (1775-1854).—<i>Philosophy</i>.—A disciple of Spinoza, taught the identity of spirit and nature, and published <i>Philosophy of Nature</i> (1797), <i>The World Soul</i>, (1798) and <i>System of Transcendental Idealism</i> (1800).</p> <p><b>Heinrich von Kleist</b> (1777-1811).—<i>Dramas, Novels</i>.—Poet of a tragic life. The most original dramatist of North Germany. His <i>Prince von Homburg</i> is Prussia's greatest historical drama.</p> <p><b>F. de la Motte Fouqué</b> (1777-1843).—<i>Fables, Lyrics</i>.—A later Romanticist, popularly known for his charming <i>Undine</i> (1811), the story of a water spirit without a soul.</p> <p><b>Clemens Brentano</b> (1778-1842).—<i>Novels, Ballads</i>.—Best known for his work on <i>The Boys' Wonder Horn</i>, the first extensive collection of German ballads.</p> <p><b>Friedrich von Ranke</b> (1781-1873).—<i>Historian</i>.—A voluminous writer.</p>	<p><b>Anna Maria Lenngren</b> (Swed.), (1755-1817).—<i>Poems</i>.—Satire and idyllic, but realities depicted in natural and simple colors. Her poetic career rather too late to show extreme traits of this period.</p> <p><b>J. T. Baggesen</b> (Dan.), (1764-1826).—<i>Novels, Essays, Travel, Lyrics, Rhymed Letters</i>.—Clothed his sparkling wit in most elegant language. Realistic nature.</p> <p><b>Jens Espelein</b> (Ic.), (1760-1836).—<i>History of Iceland 1698-1832</i>.—Twelve large quartos in annalistic form. Valuable as source, but often uncritical.</p> <p><b>Hans Christian Ørsted</b> (Dan.), (1777-1851).—<i>Science</i>.—Discovered electric magnetism.</p> <p><b>Franz Miksaël Frønsén</b> (Swed.), (1772-1847).—<i>Poems, Hymns</i>.—Exquisite lyric poems. Tender in feeling, clear in form.</p> <p><b>Countess Gyldenbourg</b> (Dan.), (1773-1856).—<i>Novels</i>.—Pseudonym. J. L. Heiberg's mother. Describes everyday life in all classes of society.</p> <p><b>Malte Brunn</b> (Dan.), (1775-1826).—<i>Geography</i>.</p> <p><b>J. P. Mynster</b>, (Dan.), (1776-1850), <i>Theology</i>.—One of Denmark's greatest theologians.</p> <p><b>Jens Jakob Børsehus</b> (Swed.), (1779-1848).—<i>Chimistry</i>.—Enjoys world-wide fame.</p> <p><b>Adam Gottlob Oehlenschläger</b> (Dan.), (1779-1850).—<i>Poems, Tragedies</i>.—Very prolific and brilliant writer. Material chiefly from Scandinavia. Wholesomely human. His <i>Helge</i> was model for Tegner's <i>Fritsja's Saga</i>.</p>	<p><b>Carlo G. Battia</b> (It.), (1766-1837).—<i>Histories</i>.—Dignified histories of the American war of independence and of Italy.</p> <p><b>Quar Krylow</b> (Russ.), (1768-1844).—<i>Fables, Odes, Epigrams, Tragedies</i>.—Full of wit and humor. His fables very popular with the Russian people.</p> <p><b>Jean Charles Stendhal</b> (It.), (1773-1842).—<i>Histories</i>.—Extensive history of the literature of the south of Europe.</p> <p><b>Alberto Lista</b> (Sp.), (1775-1841).—<i>Criticism</i>.—Literary criticism of a wholesome nature.</p>	<p>1763. <i>Georgia Gazette</i> established at Savannah.</p> <p>1772. Partition of Poland.</p> <p>1776. Battle of Bunker Hill.</p> <p>1776. American independence.</p>

TABLE VII. NINETEENTH

ENGLISH	AMERICAN	FRANCE
<p><b>Leigh Hunt</b> (1794-1859).—<i>Essays, Sketches, Memoirs, Poems</i>.—A minor poet. A mirror of appreciation rather than of creative power.</p> <p><b>Thomas De Quincey</b> (1785-1859).—<i>Confessions of an Opium Eater</i>, etc.—Passage of magnificent color. A learned man, lacking in sound realistic judgment.</p> <p><b>Lord Byron</b> (1788-1824).—<i>Poems</i>.—Vigorous, eloquent, sardonic, iconoclastic. A great satirist and in many respects a great poet.</p> <p><b>F Percy B. Shelley</b> (1792-1822).—<i>Queen Mab, Adonais, The Sky Lark</i>, etc.—A remarkable gift of lyrical melody. Full of generous impulse and the unbalanced judgment of youth. A genius.</p> <p><b>Capt. Fred Marryat</b> (1792-1848).—<i>Peter Simple, Jacob Faithful</i>, etc.—Boys' stories, but evincing considerable narrative skill.</p> <p><b>Felicita Hemans</b> (1793-1833).—<i>Lyrics</i>.—A minor poet of grace, sweetness and tenderness.</p> <p><b>George Grote</b> (1794-1871).—<i>History of Greece</i>.—A learned and sound historian, but superseded by modern exact research.</p> <p><b>John Keats</b> (1795-1821).—<i>Endymion, Hyperion</i>, etc.—A true poet, dying too young to reach full fruition of his remarkable artistic powers.</p> <p><b>Thomas Arnold</b> (1795-1842).—<i>Roman History, Sermons, Essays</i>.—A man of wide influence as headmaster of Rugby. An historian of the old school.</p> <p><b>Thomas Carlyle</b> (1795-1881).—<i>French Revolution, Cromwell, Sartor Resartus, Essays</i>, etc.—A very great though one-sided man. A prose poet, an historian of insight and industry, impatient of shams.</p> <p><b>Samuel Lover</b> (1797-1868).—<i>Songs, Ballads</i>.—A writer of slap-dash Irish stories and some good songs.</p>	<p><b>John C. Calhoun</b> (1782-1850).—<i>Speeches, Papers</i>, etc.—Foremost in logical thinking and clear exposition.</p> <p><b>Daniel Webster</b> (1782-1852).—<i>Orations</i>.—Elevated in thought and eloquent.</p> <p><b>Thomas Hart Benton</b> (1782-1858).—<i>Thirty Years' View</i>.—Rich and racy observations of wide experience.</p> <p><b>Washington Irving</b> (1783-1859).—<i>Knickerbocker's History of New York, Sketch Book</i>, etc.—Humorous, with delicate sentiment and grace.</p> <p><b>Richard Henry Dana</b> (1787-1879).—<i>Poems: The Buccaneer</i>, etc.—Overambitious and not wholly successful.</p> <p><b>Alexander Campbell</b> (1788-1866).—<i>Religious Debates, Editorials, Sermons</i>, etc.—Innovative in thought, tolerant in spirit, vigorous.</p> <p><b>James Fenimore Cooper</b> (1790-1851).—<i>Leather Stocking Tales, The Spy</i>, etc.—Romantic and overfortunate in coincidence, but readable.</p> <p><b>Jared Sparks</b> (1790-1866).—<i>American Biographies</i>.—Commendable efforts of a pioneer biographer.</p> <p><b>Wm Greene Halleck</b> (1790-1867).—<i>Poems, Marco Bozzaris</i>, etc.—Spirited but overwrought; sometimes graceful.</p> <p><b>Augustus E. Longstreet</b> (1790-1870).—<i>Georgia Scenes</i>.—Freshly humorous and delightfully fresh.</p> <p><b>George Ticknor</b> (1791-1871).—<i>History of Spanish Literature</i>.—Scholarly and authentic.</p> <p><b>John Howard Payne</b> (1792-1852).—<i>Home Sweet Home</i>.—Universal in appeal and satisfying in form.</p> <p><b>Samuel G. Goodrich</b> (1793-1860).—<i>Peter Parley Books</i>.—Popular introductions with a flavor of fiction.</p> <p><b>William Cullen Bryant</b> (1794-1878).—<i>Addresses, Letters, Poems: Thanatopsis</i>, etc.—Dignified and poised, serious and helpful.</p> <p><b>Joseph Rodman Drake</b> (1795-1820).—<i>The Culprit Fay</i>.—Cleverly executed, but ingenuously fanciful.</p> <p><b>James G. Fenwick</b> (1795-1856).—<i>Poems: Prometheus</i>, etc.—Unsustained, though not without positive merits.</p> <p><b>John Pendleton Kennedy</b> (1795-1870).—<i>Seafloor Bore, Horse Shoe Robinson</i>, etc.—Old-fashioned but interesting pictures of southern life.</p> <p><b>William B. Prescott</b> (1796-1859).—<i>Conquest of Peru, Ferdinand and Isabella</i>, etc.—Excellent history, very interestingly told.</p> <p><b>Thomas C. Halliburton</b> (1796-1866).—<i>Satanstoe</i>.—Humorous with the raciness of the soil.</p> <p><b>Hugh Swinotie Legaré</b> (1797-1843).—<i>Addresses, Articles, Letters</i>.—Academic, suited and in good form.</p>	<p><b>Henri Beyle</b> (Stendhal), (1783-1842).—<i>Novels</i>.—His novels <i>Le Rouge et le Noir</i> and <i>Le Chiribien de Parme</i> bring into literature an analysis of one's self more true than the self-presentation of the Romantic school in general.</p> <p><b>François Guizot</b> (1787-1874).—<i>Histories</i>.—His remarkable historical works have founded the school of philosophical history.</p> <p><b>Alphonse de Lamartine</b> (1790-1869).—<i>Poems, History of the Girondists</i>, etc.—The first, in date, of the great poets of the Romantic school. An idealist whose harmonious verses and high ideals have continued to grow in favor.</p> <p><b>Eugène Scribe</b> (1791-1861).—<i>Comedies</i>.—The author of a large number of plays which show more dramatic skill than study of manners or character.</p> <p><b>Victor Cousin</b> (1792-1867).—<i>Philosophy, Metaphysics</i>.—The chief of a school of philosophers called the Eclectics.</p> <p><b>Casimir Delavigne</b> (1793-1843).—<i>Dramas, Elegies</i>.—Author of popular elegies, but especially remembered as a dramatic writer.</p> <p><b>Augustin Thierry</b> (1795-1856).—<i>History of France</i>, etc.—Historian of the Romantic school.</p> <p><b>François Auguste Marie Mignet</b> (1796-1884).—<i>Histories</i>.—Like that of Guizot his history is founded upon a philosophical basis.</p> <p><b>Louis Adolphe Thiers</b> (1797-1877).—<i>French Revolution, History of the Empire</i>, etc.—A great historian and statesman. His histories are realistic and scientific.</p>

## CENTURY—Continued

GERMAN	SCANDINAVIAN	ITALIAN, SPANISH	HISTORICAL EVENTS
<p><b>Archib von Arnim</b> (1781-1831).—<i>Novels, Poems</i>—Like Brentano, a Heidelberg Romanticist, and assisted with the <i>Wander Horn</i>.</p> <p><b>Adelbert von Chamisso</b> (1781-1838).—<i>Peter Schlemihl, Poems</i>—A later Romantic lyricist, wrote ballads and <i>Peter Schlemihl</i>, the story of a man who sells his shadow, and finds his way through the world with seven-league boots; a romantic treatment of the poet's own life.</p> <p><b>Jacob Grimm</b> (1785-1863).—<i>Fairy Tales, Dictionary</i>—With his brother Wilhelm, founder of modern German philology, and compiler of the great German dictionary; known in literature for his large collection of <i>Fairy Tales</i>.</p> <p><b>Ludwig Börne</b> (1786-1837).—<i>Letters from Paris</i>—A Jew from the Frankfurt ghetto. Famous for his <i>Letters</i>, written as a protest against narrowing social limitations.</p> <p><b>Wilhelm Grimm</b> (1786-1859).—<i>Critical Writings</i>—See Jacob Grimm mentioned above.</p> <p><b>A. Justus Kerner</b> (1786-1862).—<i>Lyrics, Sonnets</i>—Famous lyric poet and Romantic mystic. His <i>Sonnets</i> is a collection of mysterious sayings and doings.</p> <p><b>Ludwig Uhland</b> (1787-1862).—<i>Criticism, Ballads</i>—Poet of Romantic type, wrote ballads, historical plays, patriotic poems, and treatises on German legends.</p> <p><b>J. von Eichendorff</b> (1788-1857).—<i>Lyrics, Life of a Good-for-Nothing</i>—The greatest lyric poet of the Romantic movement. Essentially a poet of nature, and the ideal of a free "Wanderleben" is the recurring theme.</p> <p><b>Arthur Schopenhauer</b> (1788-1860).—<i>Philosophy</i>—The philosopher of pessimism. His <i>World as Will and Idea</i> left a deep impression.</p> <p><b>Friedrich Rückert</b> (1788-1866).—<i>Sonnets in Armor, Poems</i>—Poet of the war of Liberation. His <i>Sonnets in Armor</i> recurred with the clank of arms. Also a great interpreter of oriental life and poetry.</p> <p><b>Theodor Körner</b> (1791-1813).—<i>Lyrics and Sword</i>—The young hero-poet, who fell in Lützen's corps in the war of Liberation, immortalized his poetic gift in his <i>Lyrics and Sword</i>, a collection of patriotic lyrics.</p> <p><b>Franz Grillparzer</b> (1791-1872).—<i>Dramas, Lyrics</i>—The greatest Austrian dramatist. He has neither contemporaries nor successors who can be compared to him for classic beauty and depth of human experience. His <i>Waters of the Sea and of Love</i> is a great modern love-tragedy.</p> <p><b>Wilhelm Müller</b> (1794-1827).—<i>Lyrics</i>—Master of the popular lyric. Poet of the German people in a higher degree than any other Romantic singer. His <i>Songs of the Grapes</i> are full of sentimental patriotism for Greek independence.</p> <p><b>August von Platen</b> (1796-1835).—<i>Venetian Sonnets, Poems, Stories</i>—A romantic poet and master among the German romanticists. His drama <i>The Fatal Fork</i> ridiculed the fate tragedy of the time.</p> <p><b>K. L. Immermann</b> (1796-1840).—<i>Novels</i>—A late Romantic writer best known as the author of <i>The Epigones</i>, foreshadowing the tragedy of his own life, and <i>Minchenhausen</i> distinguished for its description of Westphalian peasant life.</p> <p><b>Heinrich Heine</b> (1797-1856).—<i>Lyrics, Short Stories</i>—The greatest lyric poet after Goethe, strongly imbued with Romanticism. Best known as the author of <i>The Journey to the West Mountains</i> (1826), and the <i>Book of Songs</i> (1827).</p>	<p><b>Flan Magnussen</b> (Ic.), (1791-1847).—<i>Mythology</i>—Thorough student of northern antiquities.</p> <p><b>N. M. Petersen</b> (Dan.), (1791-1862).—<i>History, Mythology</i>—Wrote a work on Scandinavian mythology and a history of Danish literature.</p> <p><b>Emile Tegner</b> (Swed.), (1792-1846).—<i>Speeches, Poems, Frithiof's Saga</i>—World-wide renown. Great personality and original poet. Brilliant figure, clear expression. Musical lyric verse. Influenced by German and Greek. Emphasizes Scandinavian mythology.</p> <p><b>Erik Gustaf Geijer</b> (Swed.), (1793-1847).—<i>History, Philosophy, Poems</i>—Very great both as historian and poet. A scholar. His poetry appeals to the people.</p> <p><b>Christopher Hansteen</b> (Nor.), (1794-1873).—<i>Astronomy</i>—Became widely known by his study of the earth's magnetism.</p> <p><b>Bjarne Thoresen</b> (Ic.), (1796-1841).—<i>Poems</i>—Unique poems of love and patriotism. Excellent poems on deceased friends.</p> <p><b>Rasmus Rask</b> (Dan.), (1797-1832).—<i>Grammatical Works</i>—Great scholar in comparative philology. Was the first to publish the so-called Grimm's law.</p> <p><b>B. S. Ingemann</b> (Dan.), (1799-1862).—<i>Novels, Lyrics</i>—Walter Scott of Denmark. Romantic idealization of middle ages.</p> <p><b>Gustaf W. Garmelius</b> (Swed.), (1799-1877).—<i>Historical Novels</i>—In spirit of Walter Scott.</p> <p><b>J. C. Hauch</b> (Dan.), (1799-1872).—<i>Novels, Dramas, Lyrics</i>—A genuine Romanticist of deep moral earnestness. Not very popular. Best are his lyric poems.</p> <p><b>K. F. Dählgrén</b> (Swed.), (1791-1844).—<i>Novels, Short Stories, Poems</i>—At first allegorical and mystical. Later became leading humorist.</p> <p><b>J. L. Heiberg</b> (Dan.), (1791-1860).—<i>Dramas, Poems</i>—Humorous. Soc of P. A. Heiberg. Very popular. One of the best writers. Sharp critic. Musical comedies and other romantic plays.</p> <p><b>Karl J. L. Almquist</b> (Swed.), (1793-1866).—<i>Novels, Essays, Poems</i>—Unique, imaginative, mystical. Fine characterization.</p> <p><b>H. N. Clausen</b> (Dan.), (1793-1877).—<i>Criticism</i>—A clear critic in the domain of theology.</p> <p><b>Foul Möller</b> (Dan.), (1794-1838).—<i>Novels, Poems, Student Songs</i>—Spiritually sound and original in thought and expression. Influence on later realism.</p> <p><b>M. C. Hansen</b> (Nor.), (1794-1842).—<i>Novels</i>—Romantic. His stories are bright, but not national.</p> <p><b>Christian Winther</b> (Dan.), (1796-1876).—<i>Tales, Poems</i>—A master of style. Thoroughly and naturally Danish. Emphasizes nature of Denmark.</p> <p><b>K. J. Böhström</b> (Swed.), (1797-1866).—<i>Philosophy</i>—Created an independent philosophical system.</p> <p><b>Henrik Hertz</b> (Dan.), (1797-1870).—<i>Dramas, Epics, Satires</i>—Founder of the new comedy in Denmark. Elegant and correct in style. Most original in his lyric poetry.</p>	<p><b>Alessandro Manzoni</b> (1785-1873).—<i>Novel, Dramas</i>—<i>The Betrothed</i>, the greatest Italian novel.</p> <p><b>Silvio Pellico</b> (1789-1854).—<i>Italian dramatist, poet, novelist</i>.</p> <p><b>Gino Capponi</b> (1792-1876).—<i>Italian historian</i>.</p> <p><b>Cecilia Bohl von Faber</b> (Fernan Caballero), (1797-1877).—<i>Spanish novels</i>.</p>	<p>1786. Swedish academy founded.</p> <p>1789. Beginning of French Revolution.</p> <p>1792. French republic declared.</p> <p>1796. Washington issues his "Farewell Address."</p>

ENGLISH	AMERICAN	FRENCH
<p><b>Robert Pollock</b> (1798-1827).—<i>Course of Time</i>.—A sound, serious, and heavy poet; suits Scotch theologians.</p> <p><b>Thomas Hood</b> (1798-1845).—<i>Poems</i>.—A humorous poet of the first rank; some pathetic verses of high quality.</p>	<p><b>Amos Bronson Alcott</b> (1796-1838).—<i>Concord Days, Table Talks, Sermons and Conversations</i>.—Suggestively idealistic, but lacking in general interest.</p>	<p><b>Auguste Comte</b> (1798-1857).—<i>Positive Philosophy</i>.—His course on positive philosophy is one of the important works of the nineteenth century.</p>
<p><b>Thomas B. Macaulay</b> (1800-1859).—<i>Essays, History of England, Lays of Ancient Rome</i>.—He makes history alive and readable. A partisan, but on the right side.</p>	<p><b>George Bancroft</b> (1800-1891).—<i>History of the United States</i>.—Faithfully prepared and honestly presented.</p>	<p><b>Jules Michelet</b> (1798-1874).—<i>History of France</i>.—Has given a new conception of history. According to him it is a resurrection of the life of the people studied in its material and in its spiritual aspect. His style is admirably adapted to his conception of history.</p>
<p><b>Harriet Martineau</b> (1802-1876).—<i>Political Economy</i>, etc.—A woman of remarkably strong intellect. Her positions well argued but perhaps too radical.</p>	<p><b>George Bushnell</b> (1802-1876).—<i>Nature and the Supernatural, Work and Play</i>.—Serious, didactic efforts with spiritual purpose.</p>	<p><b>Moréas de Balzac</b> (1799-1850).—<i>Novels</i>.—The author of the great prose of the Romantic school. His distinguishing features are an extreme delicacy and a subtle melancholy. His <i>Le Père Goriot</i>, in which history is often arranged to suit his views, is recommended on account of its style.</p>
<p><b>Sir Edward Bulwer Lytton</b> (1803-1873).—<i>Last Days of Pompeii, Last of the Barons</i>, etc.—A versatile and successful litterateur in several forms of the novel, but prominent in none.</p>	<p><b>Ralph Waldo Emerson</b> (1803-1882).—<i>Conduct of Life, Representative Men, Essays, Poems</i>.—The prophet of American culture. Coalesces oriental conceptions and occidental individualism.</p>	<p><b>Alfred de Vigny</b> (1797-1863).—<i>Chig Maré</i>, etc.—One of the great poets of the Romantic school. His distinguishing features are an extreme delicacy and a subtle melancholy. His <i>Chig Maré</i>, in which history is often arranged to suit his views, is recommended on account of its style.</p>
<p><b>Benjamin Disraeli</b> (1804-1881).—<i>Lothair, Times Gipsy</i>, etc.—Society novels eminently readable but thoroughly artificial.</p>	<p><b>George D. Prentiss</b> (1802-1870).—<i>Editor Louisville (Ky.) Journal</i>.—Witty, sarcastic, daring and effective.</p>	<p><b>Victor Hugo</b> (1802-1885).—<i>Novels, Lyrics</i>.—One of the world-poets. In the field of epic poetry he has no rival and as a lyricist but very few. His dramas are valued more as admirable lyric pieces than as plays.</p>
<p><b>James Martineau</b> (1805-1900).—<i>Philosophy</i>.—A philosophical thinker of insight and honesty.</p>	<p><b>John S. C. Abbott</b> (1805-1877).—<i>Biographies, Histories</i>, etc.—Ephemeral in interest or easily eclipsed.</p>	<p><b>Alexandre Dumas</b> (1803-1870).—<i>Novels, Dramas</i>.—The author of a large number of popular novels based upon history and remarkable for their easy style and the creative fertility with which they abound. His dramas have a place in the history of the French theater.</p>
<p><b>Elizabeth Barrett Browning</b> (1806-1861).—<i>Aurora Leigh, Poems</i>.—A pleasing lyrical gift and warm, human sympathy made her favorite poetess in the Victorian era.</p>	<p><b>Charles E. A. Gayarré</b> (1805-1895).—<i>History of Louisiana, Fernando de Lemos</i>, etc.—Entertaining and scholarly bilingual productions.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>John Stuart Mill</b> (1806-1873).—<i>Political Economy</i>.—Of thorough intellectual honesty and diamond-clear intellect he furthered the cause of political justice and personal freedom.</p>	<p><b>Nathaniel Hawthorne</b> (1804-1864).—<i>Twice Told Tales, Scarlet Letter, Marble Faun</i>, etc.—Marked by a subtle mastery and the touch of genius.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Charles Darwin</b> (1809-1882).—<i>Origin of Species, Descent of Man</i>.—Laid and attractive in style and an unflinching lover of truth, he has had a greater influence on thought than any man of his time.</p>	<p><b>John S. C. Abbott</b> (1805-1877).—<i>Biographies, Histories</i>, etc.—Ephemeral in interest or easily eclipsed.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Alfred Tennyson</b> (1809-1892).—<i>In Memoriam, Idylls of the King, Poems</i>.—The national poet of the late 19th century; a painstaking artist and master of verbal melody.</p>	<p><b>Charles E. A. Gayarré</b> (1805-1895).—<i>History of Louisiana, Fernando de Lemos</i>, etc.—Entertaining and scholarly bilingual productions.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Elizabeth Gaskell</b> (1810-1865).—<i>Cranford, Mary Barton</i>, etc.—A writer of charming feminine humor. One of the first to make the economic problems the basis of a story.</p>	<p><b>Nathaniel P. Willis</b> (1806-1867).—<i>Poems, Sketches, Editorials</i>, etc.—Skillfully elaborated but diminishing in fame.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>William M. Thackeray</b> (1811-1863).—<i>Vanity Fair, The Newcomes, Henry Esmond</i>.—Satirist and humorist, but with great powers of characterization, especially of the everyday social elements.</p>	<p><b>William Gilmore Simms</b> (1806-1870).—<i>Poems, Novels, Biography</i>, etc.—Versatile, original and artistic.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Charles Dickens</b> (1812-1870).—<i>Novels; David Copperfield, Oliver Twist</i>, etc.—A broad humorist than Thackeray, appealing to the common human sympathies and the ordinary sense of the ridiculous.</p>	<p><b>Henry W. Longfellow</b> (1807-1882).—<i>Outs Mr. Hyperion, Poems, Hiawatha</i>, etc.—Popular in appeal and simple in form.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Robert Browning</b> (1812-1889).—<i>Dramatic Lyrics, Poems, The Ring and the Book</i>.—A powerful poet, intent more on subtle analysis of character than lucidity. His interest lay in the development of a soul.</p>	<p><b>John G. Whittier</b> (1807-1892).—<i>Editorials, Household Poems</i>.—With Burns' love of nature and human nature.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Charles Dickens</b> (1812-1870).—<i>Novels; David Copperfield, Oliver Twist</i>, etc.—A broad humorist than Thackeray, appealing to the common human sympathies and the ordinary sense of the ridiculous.</p>	<p><b>Edgar Allan Poe</b> (1809-1849).—<i>Tales, Poems, Raven, Annabel Lee</i>, etc.—Excellent as a writer of the fantastic.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Robert Browning</b> (1812-1889).—<i>Dramatic Lyrics, Poems, The Ring and the Book</i>.—A powerful poet, intent more on subtle analysis of character than lucidity. His interest lay in the development of a soul.</p>	<p><b>Albert Pike</b> (1806-1891).—<i>Hymns to the Gods, Poems</i>, etc.—Of recognized interest and merit.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Charles Dickens</b> (1812-1870).—<i>Novels; David Copperfield, Oliver Twist</i>, etc.—A broad humorist than Thackeray, appealing to the common human sympathies and the ordinary sense of the ridiculous.</p>	<p><b>Oliver Wendell Holmes</b> (1809-1894).—<i>Autocrat of the Breakfast Table, Novels, Poems</i>.—Clever, witty, versatile, and skillful.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. They are little masterpieces.</p>
<p><b>Robert Browning</b> (1812-1889).—<i>Dramatic Lyrics, Poems, The Ring and the Book</i>.—A powerful poet, intent more on subtle analysis of character than lucidity. His interest lay in the development of a soul.</p>	<p><b>Margaret Fuller Oswell</b> (1810-1850).—<i>Summers on the Lakes, Papers on Literature and Art</i>.—A valuable in transcendental aim and in merit of achievement.</p>	<p><b>Prosper Mérimée</b> (1803-1870).—<i>Stories, Novels</i>.—His stories alone give him a place among the authors of the nineteenth century. ## CENTURY—Continued

GERMAN	SCANDINAVIAN	ITALIAN, SPANISH, RUSSIAN	HISTORICAL EVENTS
<p><b>Wilhelm Haring</b> (W. Alexis), (1796-1871).—<i>Patriotic Novels</i>—One of the first and the ablest of the German imitators of Walter Scott, wrote a series of patriotic novels treating of German history.</p> <p><b>Hoffmann von Fallersleben</b> (1796-1874).—<i>Poems</i>—Philologist and poet, best known for his lyrics in the style of the ballad.</p>		<p><b>Giacomo Leopardi</b> (It.), (1798-1837).—<i>Poems</i>—Famously with "the infinite vanity of all things."</p>	
<p><b>C. D. Grabbe</b> (1801-1836).—<i>Dramas</i>—Deeply pessimistic and romantically unbalanced, but often masterful in dramatic characterization.</p> <p><b>Wilhelm Hauff</b> (1802-1827).—<i>Lichtenstein, Man in the Moon, Short Stories</i>—An eminent novelist, greatly influenced by Walter Scott. <i>Lichtenstein</i> is a story of Württemberg in the sixteenth century.</p>	<p><b>Fredrika Bremer</b> (Swed.), (1801-1865).—<i>Novels</i>—Describes family life of middle class realism. Worked for emancipation of woman. Was popular in America and England.</p>	<p><b>Alexander Pushkin</b> (Russ.), (1799-1837).—<i>Poems, Stories, Novels, Dramas</i>—A great poet. Romantic at first. Later emphasized national feeling in Russian literature. Greatly influenced by Byron.</p>	<p>1799. Death of Washington.</p>
<p><b>Eduard Mörike</b> (1804-1875).—<i>Lyrics, Stories</i>—The greatest lyric poet of Russia. There is a peculiar charm in his delicacy of touch and his simplicity.</p>	<p><b>E. Keyser</b> (Nor.), (1803-1864).—<i>History</i>—Wrote a learned work on the Catholic church in Norway.</p>	<p><b>Manuel Bretón de los Herberos</b> (Sp.), (1800-1873).—<i>Dramas</i>—Popular modern Spanish poet. Gives a good picture of Spanish social life.</p>	<p>1801. Discovery of first asteroid by Piazzi.</p>
<p><b>Heinrich Laube</b> (1806-1884).—<i>Novels, Plays</i>—Witty, declamatory and sententious, but seldom a delicate poet. His chief works are novels or dramas of purpose in the spirit of radical young Germany.</p>	<p><b>Johan Ludvig Runeberg</b> (Swed.), (1804-1877).—<i>Poems, Dramas</i>—Born in Finland. Describes realistically Finnish home-life. Idyllic, epic, and lyric poetry. Fine characterization. Most popular are <i>Fänrik Ståls Söner</i>, dealing with Finnish-Russian war of 1808-1809.</p> <p><b>J. N. Madvig</b> (Dan.), (1804-1886).—<i>Latin Grammar</i>—Great linguist and Latin scholar.</p>	<p><b>Hans Christian Andersen</b> (Dan.), (1805-1875).—<i>Fairy Tales, Novels, Dramas, Poems</i>—Used language of the people and of childhood. Next to bible, his <i>Fairy Tales</i> have been translated into the most foreign languages.</p>	<p>1804. Napoleonic code adopted in France.</p>
<p><b>Fritz Reuter</b> (1810-1874).—<i>Poems, Novels</i>—A Mecklenburg poet who wrote in his own dialect. A born story-teller, with broad realistic humor.</p> <p><b>H. Ferdinand Freiligrath</b> (1810-1876).—<i>Poems, Translations</i>—Poet of the Revolution and friend of Longfellow. Some of his finest translations are from Robert Burns.</p>	<p><b>Jonas Hallgrímsson</b> (Ic.), (1807-1845).—<i>Iceland Gunnarsholms</i>—Popular patriotic songs. Excellent power over language. One of the best poets of modern Iceland.</p> <p><b>J. S. C. Weihe</b> (Nor.), (1807-1873).—<i>Poems</i>—Polymath sonnets, lyric and descriptive. Opposed bitterly the hyper-patriotism of Wergeland.</p> <p><b>H. A. Wergeland</b> (Nor.), (1808-1845).—<i>Poems</i>—Poet, patriot, and later of Denmark. Brilliant, original, and imaginative.</p> <p><b>Fred. Falckman-Müller</b> (Dan.), (1808-1876).—<i>Poems, Mythological Plays</i>—Subjects from Greek mythology, Bible and from life. <i>Adam Homo</i> is his greatest work. Satire of life. A monumental work.</p>	<p><b>Alcel Kolbow</b> (Russ.), (1809-1842).—<i>Lyrics</i>—Deep feeling. The Russian Burns.</p> <p><b>Nikolai Gogol</b> (Russ.), (1809-1852).—<i>Plays, Tales, Novels</i>—The greatest of Russian humorists. Satirizes all classes of society.</p>	<p>1805. Battle of Trafalgar.</p>
<p><b>Karl Gutzkow</b> (1811-1878).—<i>Novels, Plays</i>—For a time the most influential writer in Germany. Combated the misuse of political and clerical power. <i>Uriel Acosta</i>, his best drama, is a strong plea for freedom of thought.</p>	<p><b>F. A. Munck</b> (Nor.), (1810-1866).—<i>History</i>—His great history of Norway is in eight short volumes. Brilliant and industrious. Both Munck and Keyser were overpatriotic in believing Norway the hearth of Scandinavianism from the historic point of view.</p>	<p><b>W. G. Bellinsky</b> (Russ.), (1810-1848).—<i>Criticism</i>—In spite of the censorship of the press he carried a powerful uplifting influence on society by his literary criticism.</p>	<p>1807. Fulton's steamboat on the Hudson.</p>
<p><b>Berthold Auerbach</b> (1812-1882).—<i>Novels, Short Stories</i>—The poet of the Rumanian Black Forest. His stories of village life, though not realistic, charm by their naive elements.</p>	<p><b>A. Munck</b> (Nor.), (1811-1884).—<i>Lyric Poems</i>—His chief work is <i>Figen fra Norge</i>, taken from Norwegian history.</p> <p><b>August Blanche</b> (Swed.), (1811-1868).—<i>Comedy, Novels, Short Stories, Sketches</i>—Was very popular. Comedy deals with lower classes. Novels sensational. Stories and sketches realistic.</p>	<p><b>F. C. Asbjørnsen</b> (Nor.), (1812-1885).—<i>Folk Tales</i>—The Grimm of Norway.</p>	<p>1809. Battle of Wagram.</p>
<p><b>Friedrich Hebbel</b> (1813-1863).—<i>Dramas</i>—The chief German dramatist of the century. A great innovator. His best works represent the clash of new epochs with those passing away.</p>	<p><b>S. A. Kierkegaard</b> (Dan.), (1813-1855).—<i>Philosophy</i>—Denmark's greatest religious thinker. Strong imagination. Wrote a beautiful poetic prose.</p>	<p><b>Alexander Herzen</b> (Russ.), (1812-1870).—<i>Journalism</i>—Greatest journalist of his time. Devoted to pleas for liberal institutions.</p>	<p>1812. U.S. and English war.</p>

TABLE VII. NINETEENTH

ENGLISH	AMERICAN	FRENCH
<p><b>Charles Reade</b> (1814-1884).—<i>Peep Woffington, Cloister and Hearth</i>, etc.—A vigorous narrator, animated by hatred of injustice.</p> <p><b>Anthony Trollope</b> (1815-1882).—<i>Barsetshire Towers</i>, etc.—Admirably realistic presentation of English society, political and ecclesiastical.</p> <p><b>George Rawlinson</b> (1815-1902).—<i>Five Great Monarchies</i>.—A learned Assyrian and Oriental scholar.</p> <p><b>Charlotte Brontë</b> (1816-1855).—<i>Jane Eyre</i>, <i>The Professor</i>, etc.—Great power in novels based on narrow experience.</p> <p><b>James Anthony Froude</b> (1818-1894).—<i>History of England</i>.—A brilliant prose-writer makes history human and interesting and suggestive.</p> <p><b>George Eliot</b> (1819-1880).—<i>Silas Marner, Spanish Gypsy</i>, <i>Poems</i>.—The greatest woman novelist. A realist with insight. Powers of wit and characterization; construction not remarkable.</p> <p><b>Charles Kingsley</b> (1819-1875).—<i>Hypatia, Peverell</i>.—His novels, in spite of slight objections and a taint of sentimentality, are vigorous and wholesome.</p> <p><b>John Ruskin</b> (1819-1900).—<i>Stones of Venice, Modern Painters</i>, etc.—A great stylist. As art critic, subjective and governed by the moral suggestiveness of the object. As an economist, an idealist.</p> <p><b>John Tyndall</b> (1820-1893).—<i>Scientific Papers</i>.—Unsurpassed, unless it be Huxley's, as a popularizer of Darwin's ideas.</p> <p><b>Herbert Spencer</b> (1820-1903).—<i>First Principles</i>, etc.—A deep thinker but ponderous to style. Applied principle of evolution to sociology, history, etc.</p> <p><b>Matthew Arnold</b> (1822-1888).—<i>Essays and Criticism, Sohrab and Rustum, Poems</i>.—Liberal in thought, but dominated by aristocratic prejudice on the literary side. As a poet inclined to despairing pessimism; weak to the power of verbal melody.</p> <p><b>Edward A. Freeman</b> (1823-1892).—<i>Histories</i>.—A conscientious, honest, painstaking historian.</p> <p><b>Thomas Hughes</b> (1823-1896).—<i>Tom Brown at Oxford</i>, etc.—A manly, breezy person, who wrote one good book for boys.</p> <p><b>Thomas Henry Huxley</b> (1825-1895).—<i>Man's Place in Nature</i>, etc.—A master of exposition and, with Tyndall, very effective in presenting the idea of evolution.</p> <p><b>E. D. Blackmore</b> (1825-1900).—<i>Novels: Lorna Doone</i>, etc.—Infused an element of romance into the modern novel.</p> <p><b>Dinah Maria Mulock</b> (1826-1887).—<i>John Halifax</i>, etc., <i>Poems</i>.—Author of some twenty novels of which <i>John Halifax</i> is the best. Also of pleasing minor verse.</p> <p><b>Dante Gabriel Rossetti</b> (1828-1882).—<i>Poems: The Blessed Damozel</i>, etc.—A highly imaginative poet, a master of color in verse and on canvas.</p>	<p><b>John Lothrop Motley</b> (1814-1877).—<i>Dutch Republic, United Netherlands</i>.—A rapid, easy style in presenting results of research.</p> <p><b>Rufus W. Griswold</b> (1815-1857).—<i>Christian Ballads, Poets and Poetry of America, Famous Poets</i>.—Valuable critical studies marred by partiality.</p> <p><b>John G. Saxe</b> (1816-1887).—<i>The Money King, New Rules of the Lock</i>, etc.—Humorous and sprightly.</p> <p><b>Samuel A. Allibone</b> (1816-1889).—<i>Literature and Authors</i>.—Laborious and valuable.</p> <p><b>Henry D. Thoreau</b> (1817-1862).—<i>Walden, Excursions</i>.—Redolent of nature love, and cultured scholarship.</p> <p><b>John Bigelow</b> (1817).—<i>Life of Benjamin Franklin</i>.—Sympathetic and sage.</p> <p><b>J. G. Holland</b> (1819-1881).—<i>Timothy Titcomb's Letters, Kalvins</i>.—Enjoyed a large popularity.</p> <p><b>Edwin P. Whipple</b> (1819-1886).—<i>Essays and Reviews, America Litterata</i>.—Of very distinct cultural value.</p> <p><b>James Russell Lowell</b> (1819-1891).—<i>Among My Books, My Study Windows, Blueless Papers, Poems: Sir Launfal</i>, etc.—Keen, sparkling, scholarly, and artistic.</p> <p><b>Walt Whitman</b> (1819-1892).—<i>Poems: Leaves of Grass, My Captain</i>, etc.—Unique in claim and form.</p> <p><b>Julia Ward Howe</b> (1819-1910).—<i>Social and Philosophical Papers, Battle Hymn of the Republic</i>.—Representative of the spirit of the times.</p> <p><b>Margaret J. Preston</b> (1820-1897).—<i>Bechenbrook, Curious, Colonial Ballads</i>.—Cultured and of human interest.</p> <p><b>Richard Grant White</b> (1821-1885).—<i>Words and Their Uses, Everyday English</i>.—Scholarly and suggestive.</p> <p><b>Thomas Buchanan Read</b> (1822-1872).—<i>Poems, Drifting, Sheridan's Ride</i>, etc.—Commendable, especially in form.</p> <p><b>James Parton</b> (1822-1891).—<i>Biographies</i>.—Serviceable, but not satisfying.</p> <p><b>Edward Everett Hale</b> (1822-1909).—<i>The Man Without a Country, His Last Best</i>.—Vigorous and pointed, but provincial.</p> <p><b>Donald G. Mitchell</b> (1822-1909).—<i>Dream Life, Reveries of a Bachelor</i>.—Attractive in meditation and grace.</p> <p><b>George H. Boker</b> (1823-1890).—<i>Plays, Poems of the War</i>.—Indisputably appreciated.</p> <p><b>Francis Parkman</b> (1823-1893).—<i>Oregon Trail, Medicine and Wolfe</i>, etc.—Romantic, picturesque and of real interest.</p> <p><b>George W. Curtis</b> (1824-1892).—<i>Patriarch Papers, First and Last</i>, etc.—Widely popular and effective.</p> <p><b>Bayard Taylor</b> (1825-1878).—<i>Northern Travel, Greece and Russia, Poems of the Orient, Translation of Faust</i>.—Too good at many things to be best at any.</p> <p><b>Stephen Collins Foster</b> (1826-1864).—<i>Old Folks at Home, Old Uncle Ned</i>, etc.—Popular in vein and melody.</p> <p><b>Low Wallace</b> (1827-1905).—<i>The Fair God, Prince of India, Ben Hur</i>.—Uneven, but at times highly successful.</p>	<p><b>Eugene Labiche</b> (1815-1888).—<i>Comedies</i>.—A master in the art of writing many light comedies or vaudevilles.</p> <p><b>Lecote de Lisle</b> (1818-1894).—<i>Poems</i>.—One of the greatest poets of the second half of the nineteenth century. He was the head of the group of poets called the Parnassians who sought above all technical perfection in poetry. He is a pessimist and in all his poems we see no aspiration toward death as the final rest.</p> <p><b>Emile Augier</b> (1820-1889).—<i>Dramas</i>.—One of the masters of the modern French drama. Less aggressive than his contemporary Dumas the Son, his influence in some respects was greater.</p> <p><b>Gustav Flaubert</b> (1821-1880).—<i>Novels</i>.—Wrote the most perfect novel of the century, <i>Madame Bovary</i>. One of the other side his <i>Salammbo</i> is purely romantic.</p> <p><b>Octave Feuillet</b> (1821-1890).—<i>Novels, Dramas</i>.—All his novels describe society.</p> <p><b>Henri Murger</b> (1822-1861).—<i>Novels</i>.—His <i>Scenes of Bohemian Life</i>, in which he depicts the bohemian life of a certain class of students, is still enjoyed.</p> <p><b>Edmond de Goncourt</b> (1822-1890).—<i>Novels</i>.—He and his brother Jules de Goncourt claim to be the first to paint true life. They are the apostles of "modernism."</p> <p><b>Emile Zola</b> (1822-1899).—<i>Novels</i>.—With Alexandre Chatriau he wrote a large number of novels in which are painted in a free and simple style the customs and thoughts of the Alsatians especially during the war of the first empire.</p> <p><b>J. Ernest Renan</b> (1823-1892).—<i>Life of Jesus</i>, etc.—Critic and historian but above all a marvelous artist, he greatly influenced the thought of his day. With Taine, but in a different way, he contributed to the triumph of positivism.</p> <p><b>Alexandre Dumas the Son</b> (1824-1895).—<i>Novels, Dramas</i>.—Marvellously clear and concise style. Dramas full of wit but lack in kindliness.</p> <p><b>Alexandre Chatriau</b> (1826-1890).—<i>Novels</i>.—See Erkman (1822-1896).</p> <p><b>Francisque Sarcey</b> (1827-1899).—<i>Criticism</i>.—A recognized authority on the drama, his criticism bears especially on the theater.</p> <p><b>H. A. Taine</b> (1828-1893).—<i>History of Literature</i>, etc.—<i>Origins of Contemporary France</i>, his most powerful work, shows his genius as a critic and as historian. He belongs to the same school as Litton but he is more aggressive.</p>

## CENTURY—Continued

GERMAN	SCANDINAVIAN	RUSSIAN, SPANISH, HUNGARIAN	HISTORICAL EVENTS
<p><b>Otto Ludwig</b> (1813-1865).—<i>Dramas, Shakespeare Studies, Novels</i>—Master of detail-painting in his novels. His novel <i>Between Heaven and Earth</i> has become a classic. His dramatic work suffered under critical sentences.</p> <p><b>Richard Wagner</b> (1813-1883).—<i>Operas</i>—Creator of the music-drama. Insisted that German drama must be national and so drew for themes on older Germanic myths.</p> <p><b>Emanuel Geibel</b> (1815-1884).—<i>Poems, Voices of the Time</i>—Successful writer of popular songs. <i>Voices of the Time</i> treats political events in a conciliatory tone.</p> <p><b>Gustav Freytag</b> (1816-1895).—<i>Novels, Dramas</i>—His <i>Antennae</i> is a cycle of the greatest modern German novels, awaking the national consciousness of the German people.</p> <p><b>Theodor Storm</b> (1817-1888).—<i>Lyrics, Novels</i>—Masterful writer of the novel of reminiscence. The lyric note is prominent in his prose.</p> <p><b>Gottfried Keller</b> (1819-1890).—<i>Novels, Short Stories</i>—Master of the "novelle," or short story. Strong independence of spirit reflected in this Swiss poet.</p> <p><b>Salomon Mosenthal</b> (1821-1877).—<i>Novels</i>—Chiefly historical, including <i>Leah the Forsaken, The Queen of Sheba</i>, etc.</p> <p><b>Conrad Ferdinand Meyer</b> (1825-1898).—<i>Short Stories, Novels</i>—Countryman of Keller, and one of the best story writers of the century. Particularly happy in giving true historical coloring to his novels.</p> <p><b>J. V. von Scheffel</b> (1826-1886).—A late successor of Walter Scott. <i>Eckehard</i>, one of the greatest German historical novels. <i>The Trumpeter of Sickingen</i>, an epic in the Romantic spirit.</p>	<p><b>J. Moe</b> (Nor.), (1813-1880).—<i>Poems</i>—Lyrics. Assisted <i>Ashbjørnsen</i> in collecting the popular tales of Norway.</p> <p><b>J. C. Heistrup</b> (Dan.), (1818-1892).—<i>Comedies, Popular Songs</i>—A great favorite. Adapts language to characters. Vivid picture of student life and life of middle classes.</p> <p><b>Meir Goldschmidt</b> (Dan.), (1819-1887).—<i>Journalism, Novels, Short Stories</i>—Good stylist. Felt keenly his Jewish origin, but was not ashamed of it.</p> <p><b>Victor Rydberg</b> (Swed.), (1828-1895).—<i>Philosophy, History, Mythology, Novels, Poems</i>—Great scholar, poet, and philosopher. Extreme purist in language.</p>	<p><b>Iwan Gontcharoff</b> (Russ.), (1813-1891).—<i>Novels</i>—At first romantic then realistic. His great work <i>Obdorsk</i> represents strongly that inertia which renders the hero incapable of action.</p> <p><b>Michail Lermontov</b> (Russ.), (1814-1841).—<i>Poems, Novels</i>—Powerful prose. Strongly attacked the government and the prevailing tone in society.</p> <p><b>José de Espronceda</b> (Sp.), (1815-1842).—<i>Lyric Poems</i>—Imbued with the manner and spirit of Byron.</p> <p><b>Alexis Tolstol</b> (Russ.), (1817-1875).—<i>Dramas</i>—Excellent historical dramatist. Fine artistic sense.</p> <p><b>Iwan Turgenev</b> (Russ.), (1818-1883).—<i>Novels, Stories</i>—Great prose-artist. Melancholy pessimism. Faithful reflection of the inner development of Russian society.</p> <p><b>Feodor Dostoyevsky</b> (Russ.), (1821-1881).—<i>Novels</i>—Great power of psychological analysis. Even claimed by Russian criminologists as their colleague.</p> <p><b>Nikolai Nekrasoff</b> (Russ.), (1821-1888).—<i>Lyrics</i>—Depth of feeling. Rare impassioned lyric power.</p> <p><b>Alex. Petöfi</b> (Hung.), (1823-1849).—<i>Lyrics, Translations</i>—One of the greatest lyric poets of the nineteenth century. Truth and naturalness. Full of the passion, melancholy, and humor of the Hungarians.</p> <p><b>Michail Saltikow</b> (Russ.), (1826-1889).—<i>Satiric Tales</i>—Written with his heart's blood. Keen wit, original in invention.</p> <p><b>Juan Valera</b> (Sp.), (1827).—<i>Novels</i>—Combines elegance of language with depth of thought.</p>	<p>1814. Stephenson's locomotive.</p> <p>1815. Battle of New Orleans.</p> <p>1815. Napoleon defeated at Waterloo.</p> <p>1821. Greek war of independence against Turkey.</p> <p>1824. National gallery in London opened.</p>

ENGLISH	AMERICAN	FRENCH
<p><b>George Meredith</b> (1828-1909).—<i>The Egoist, Diana of the Crossways</i>, etc.—Novels of extraordinary power. Style epigrammatic and not attractive.</p> <p><b>Samuel R. Gardiner</b> (1829-1902).—<i>Historical</i>.—A happy combination of attractive narrative and scholarly thoroughness.</p>	<p><b>Henry Timrod</b> (1829-1867).—<i>Poems</i>.—Admired in his time for his taste and manner.</p> <p><b>Chas. Dudley Warner</b> (1829-1909).—<i>My Summer in a Garden, Little Journeys</i>, etc.—Catholic in interests and attainments.</p> <p><b>John Eaton Cooke</b> (1830-1886).—<i>Novels: Story of Eagle's Nest, etc., Lives of Lee and Jackson</i>.—Firm favorites with romantic youth.</p>	<p><b>Jules Verne</b> (1828-1905).—<i>Twenty Thousand Leagues Under the Sea, Around the World in Eighty Days</i>, etc.—His novels have done much to popularize several branches of science. Interesting and instructive, they have been widely read all over the civilized world by both young and old.</p>
<p><b>Jean Ingelow</b> (1820-1897).—<i>Poems</i>.—A charming lyrical talent, of limited productive power.</p> <p><b>Justin McCarthy</b> (1830).—<i>History of Our Own Times, Novels</i>.—A prolific journalist, novelist, and historian of modern times.</p>	<p><b>Paul Hamilton Hayne</b> (1831-1886).—<i>Sonnets, Legends, Lyrics</i>.—In sonnets excellent, in other poems too prolific.</p>	<p><b>Jules de Goncourt</b> (1830-1870).—<i>Novels</i>.—See Edmond de Goncourt (1822-1890).</p>
<p><b>Edward Lord Lytton, (Owen Meredith),</b> (1811-1891).—<i>Biography of Palmer Lytton, Lucile</i>, etc.—Fluent writer of light verse and society verse.</p>	<p><b>Louise May Alcott</b> (1832-1888).—<i>Little Women, Little Men</i>.—Influential in their popular appeal.</p> <p><b>Edmund C. Stedman</b> (1838-1908).—<i>Victorian Poets, Poets of America, Alice of Monmouth, Poise in Wall Street</i>.—Showing creative power and critical ability.</p>	<p><b>Victorien Sardou</b> (1831-1908).—<i>Dramas</i>.—Although the theater of Sardou is generally superficial this author has a remarkable talent for showing exterior life and many of his vaudevilles, comedies and historical dramas met with pronounced success.</p>
<p><b>Edwin Arnold</b> (1832-1904).—<i>Light of Asia, Poems</i>.—An able journalist and prolific minor poet.</p>	<p><b>Chas. Farrar Browne (Artemus Ward)</b> (1834-1867).—<i>Artemus Ward, His Book</i>, etc.—Humorous in exaggeration and a perversion.</p> <p><b>Frank R. Stockton</b> (1834-1902).—<i>Rudder Grange, The Lady of the Tiger</i>.—Ingenuous in plot, straightforward in style.</p>	<p><b>Henri Meilhac</b> (1832-1897).—<i>Ludovic Halévy</i> (1834-1908).—<i>Comedies</i>.—Wrote together a number of very successful light comedies. They created the "opérette."</p>
<p><b>William Morris</b> (1834-1896).—<i>Essays on Art, etc., Poems, Early Paradise</i>.—Prolific as a narrative poet, fond of classic and medieval legends.</p> <p><b>George du Maurier</b> (1834-1896).—<i>Peter Ibbotson, Trilby</i>.—An artist and poet. <i>Peter Ibbotson</i> is a fanciful romance of dream life. <i>Trilby</i>, scene in Latin quarter of Paris, a masterful study of character.</p>	<p><b>Moses Cati Tyler</b> (1835-1900).—<i>History of American Literature</i>.—Accurate and exhaustive.</p> <p><b>Samuel L. Clemens</b> (1835-1910).—<i>Innocents Abroad, Huckleberry Finn</i>, etc.—Thoroughly representative of American humor.</p> <p><b>Thomas Bailey Aldrich</b> (1836-1907).—<i>Novels: Moravia, Dean</i>, etc.—Cultivated and of literary talent.</p>	<p><b>Edouard Paileron</b> (1834-1899).—<i>Comedies</i>.—His light comedies are full of graceful and delicate touches. In <i>the Monde</i> as <i>l'on s'ennoie</i> his tone is considerably raised.</p>
<p><b>John Richard Green</b> (1837-1883).—<i>History of the English People</i>.—Industrious and conscientious. His work more than a record of war and politics. Clear and simple style.</p>	<p><b>William Dean Howells</b> (1837).—<i>Venetian Life, Mrs. Silas Lapham</i>, etc.—Realistic and entertainingly descriptive.</p> <p><b>John Burroughs</b> (1837).—<i>Walden, Robin, Winter Satisfactions</i>.—Strongly uttering the charms of nature.</p>	<p><b>Henri Beque</b> (1837-1899).—<i>Dramas</i>.—With the "Corbreaux" (Cruve) a new school of drama was inaugurated: The naturalists play. In spite of his exaggerations dramatic art owes a great deal to Beque.</p>
<p><b>Algernon Chas. Swinburne</b> (1837-1909).—<i>Poems</i>.—A poet of remarkable musical power, master of handling but involved prose, a cult of enthusiasm and eloquence.</p> <p><b>John Morley</b> (1838).—<i>Criticism, English Men of Letters</i>, (Ed.).—A sound literary historian and critic and a thinker of force and scope.</p>	<p><b>Thomas E. Lounsbury</b> (1838).—<i>Life of Cooper, Studies in Chaucer</i>, etc.—Of recognized scholarship and ability.</p> <p><b>Francis Bret Hart</b> (1839-1902).—<i>Luck of Roaring Camp, Gabriel Conroy, Poems</i>.—Of international fame. Faithful and skillful character portrayals.</p>	<p><b>Sully-Prudhomme</b> (1839-1907).—<i>Poems</i>.—One of the greatest poets of the nineteenth century. From the "Paranassus" he took their respect for form. He was not only an artist but a thinker and a moralist. In him positivism and idealism are perfectly blended.</p>
<p><b>Walter H. Pater</b> (1839-1894).—<i>Marius the Epicurean</i>, etc.—A wonderfully finished prose style, which sometimes diverts attention from the justness and beauty of the thought.</p>	<p><b>Joaquin Miller</b> (1841).—<i>The Danites in the Sierras, Slinger of the Sierras</i>.—With the sweep and breadth of the prairies.</p>	<p><b>Garçon Paris</b> (1841-1903).—<i>Philosophy</i>.—Greatest literary critic of France since Sainte-Beuve, especially on early French literature.</p>
<p><b>Henry Austin Dobson</b> (1840).—<i>Vignettes in Rhyme, Proverbs in Prose</i>.—The English Iluzac. An authority on eighteenth century social and literary life. Charming light verses.</p> <p><b>Thomas Hardy</b> (1840).—<i>Novels: Tess of d'Uverville</i>, etc.—Novels depicting country life. A writer of broad humanity. His books pose as at once wit, realism, and an idyllic quality.</p>	<p><b>Sidney Lanier</b> (1842-1881).—<i>The Bug's Prosser, Tiger-Lilies, Poems</i>.—Artistic to a high degree.</p> <p><b>George W. Cable</b> (1844).—<i>Old Creole Days</i>, etc.—Successful in achievement of purpose.</p>	<p><b>Alphonse Daudet</b> (1840-1897).—<i>Novels</i>.—In most of his works Daudet is a painter of rare ability of manners and customs; in two or three he shows a very keen psychological insight. He is one of the great prose writers of the century.</p>
<p><b>William Black</b> (1841-1898).—<i>Novels: In Silk Attire</i>, etc.—His stories have considerable charm but not much force. Gaelic bloodland depicted pleasantly but unconvincingly.</p> <p><b>Robert W. Buchanan</b> (1841-1901).—<i>Alons in London, Poems</i>.—A minor poet and dramatist of considerable output. Known for his attack on Rossetti in <i>The Fleishy School of Poetry</i>.</p>	<p><b>Elizabeth N. Phelps Ward</b> (1844-1911).—<i>Gate-Ajar</i>, etc. Widely read for religious sentiment.</p>	<p><b>Emile Zola</b> (1840-1902).—<i>Novels</i>.—Called the head of the naturalistic school because he defined the theories of the school. His twenty volumes of the Rougon-Macquart series are a grand epopee of "human animality." In his later works materialism becomes idealism and his intense pessimism an exaggerated optimism. He is in literature a great painter of masses and crowds.</p>
<p><b>Robert W. Buchanan</b> (1841-1901).—<i>Alons in London, Poems</i>.—A minor poet and dramatist of considerable output. Known for his attack on Rossetti in <i>The Fleishy School of Poetry</i>.</p>	<p><b>George W. Cable</b> (1844).—<i>Old Creole Days</i>, etc.—Successful in achievement of purpose.</p>	<p><b>Alphonse Daudet</b> (1840-1897).—<i>Novels</i>.—In most of his works Daudet is a painter of rare ability of manners and customs; in two or three he shows a very keen psychological insight. He is one of the great prose writers of the century.</p>
<p><b>Robert W. Buchanan</b> (1841-1901).—<i>Alons in London, Poems</i>.—A minor poet and dramatist of considerable output. Known for his attack on Rossetti in <i>The Fleishy School of Poetry</i>.</p>	<p><b>George W. Cable</b> (1844).—<i>Old Creole Days</i>, etc.—Successful in achievement of purpose.</p>	<p><b>Alphonse Daudet</b> (1840-1897).—<i>Novels</i>.—In most of his works Daudet is a painter of rare ability of manners and customs; in two or three he shows a very keen psychological insight. He is one of the great prose writers of the century.</p>
<p><b>Robert W. Buchanan</b> (1841-1901).—<i>Alons in London, Poems</i>.—A minor poet and dramatist of considerable output. Sharp as fire, terse and vivid dialogue. Attacked conventional hypocrisy.</p> <p><b>B. Björnson</b> (Nor.), (1832-1910).—<i>Novels, Dramas, Poems</i>—Very popular. Forceful, deeply in earnest. Author of Norway's favorite national song. Active in public questions.</p> <p><b>Jonas Lie</b> (Nor.), (1833-1908).—<i>Stories, Dramas</i>—Sketches of nature and popular life in the north of Norway.</p> <p><b>Mathias Jorchumsson</b> (Ic.), (1835).—<i>Poems, Dramas</i>—Lyric and tragic. Translator of Shakespeare, Byron.</p> <p><b>Karl Sjöström</b> (Swed.), (1841-1903).—<i>Poems</i>—Clear elegant form.</p> <p><b>Georg Brandes</b> (Dan.), (1842).—<i>Literary Essays</i>—A piercing literary critic. Splendid use of language. Has had a hard career.</p>	<p><b>Leo Tolstoy</b> (Russ.), (1828-1910).—<i>Novels, Essays, Criticisms</i>—Strong individualism paired with the doctrine of non-resistance. Powerful appeal to simple life of the people as a standard of civilization.</p> <p><b>of Echegaray</b> (Sp.), (1835).—<i>Dramas</i>—Most prominent representative of the modern Spanish dramatists. Romantic in tone.</p> <p><b>Giosuè Carducci</b> (It.), (1836-1907).—<i>Poems</i>—Progressive, liberty-loving lyrics.</p> <p><b>Giovanni Verga</b> (It.), (1840).—<i>Novels</i>—Tales of Sicilian peasantry.</p>	<p>1831. Death of Mrs. Siddons.</p> <p>1832. Cholera in Europe and America.</p> <p>1835. Morse's model electrical telegraph.</p> <p>1839. Daguerre's perfected photographic process.</p> <p>1844. Electrical telegraph between Baltimore and Washington.</p>

TABLE VII. NINETEENTH CENTURY—Continued

ENGLISH	AMERICAN	FRENCH	GERMAN	SCANDINAVIAN	RUSSIAN, POLISH, HUNGARIAN, ITALIAN, SPANISH, PORTUGUESE	HISTORICAL EVENTS
			<b>Ernst von Wildenbruch</b> (1845-1909).— <i>Dramas, Short Stories, Poems</i> .—The greatest historical dramatist of his time.		<b>B. Pérez Galdós</b> (Sp.). (1843).— <i>Novels, Dramas</i> .—Studies of Spanish political and religious life.	
	<b>Arthur R. Hardy</b> (1847).— <i>Pastor Ross</i> , etc.—Of trained literary ability.	<b>Emile Faguet</b> (1847).— <i>Criticism</i> .—One of the great critics of our days.		<b>Hoiger Drachmann</b> (Dan.). (1846-1908).— <i>Novels, Lyrics, Dramas</i> .—His lyric poems and lyric dramas rank among the best.	<b>Henryk Sienkiewicz</b> (Polish). (1846).— <i>Novels</i> .—Very attractive historical novels. Keen at exploiting remarkable epochs of history.	1846. Mexican war.
	<b>James Lane Allen</b> (1849).— <i>Poets and Poets, The Choir Invisible</i> , etc.—Reaching a high standard of excellence.	<b>Frédéric Masson</b> (1847).— <i>Histories</i> .—His best known histories are on the private life of Napoleon.		<b>August Strindberg</b> (Swed.). (1849).— <i>Novels, Dramas, Short Stories, Lyrics</i> .—Greatest writer of to-day in Sweden. Superb dramatist.		
<b>Robert Louis Stevenson</b> (1850-1894).— <i>Essays, Novels, Child's Garden of Verses</i> , etc.—Careful and finished as a stylist, an excellent storyteller. <i>Treasure Island</i> and his <i>Scottish Tales</i> are true classics.		<b>Ferdinand Brunetiere</b> (1849-1906).— <i>Criticism</i> .—Occupies a high rank among the modern critics.				
	<b>Robert Louis Stevenson</b> (1850-1894).— <i>Essays, Novels, Child's Garden of Verses</i> , etc.—Careful and finished as a stylist, an excellent storyteller. <i>Treasure Island</i> and his <i>Scottish Tales</i> are true classics.	<b>Jean Richepin</b> (1849).— <i>Dramas</i> .—A poet of great talent and power. His drama <i>The Tramp</i> is one of the good plays of our times.				
		<b>Pierre Loti</b> (1850).— <i>Novels, Travels</i> .—Painter and a poet who gives us an image of his impressions of life and of the countries through which he passes.				1850. Clayton-Bulwer treaty.
		<b>Paul Bourget</b> (1852).— <i>Novels</i> .—He is a scientific psychologist who has used his great power of analysis in the study of society people.				
		<b>Jules Lemaitre</b> (1853).— <i>Dramas, Criticism</i> .—The impressionist critic par excellence.				
		<b>Edmond Rod</b> (1857-1910).— <i>Novels</i> .—The problem of human destiny.	<b>Hermann Sudermann</b> (1857).— <i>Plays, Novels</i> .—Foot of the realistic school. His great novel is <i>Das Geschick</i> , reflecting the struggles of the author's own life.	<b>Henrik Pontoppidan</b> (Dan.). (1857).— <i>Novels</i> .—Greatest prose writer of to-day. Ironical.	<b>Wesewolod Garshin</b> (Russ.). (1855-1888).— <i>Novels</i> .—Glorious fantasy. Unfortunately marred by detailed psychological analysis.	1853. Louis Napoleon installed. 1854. Treaty between United States and Japan. 1858. First Atlantic cable.
		<b>Paul Hervieu</b> (1857).— <i>Dramas</i> .—Power and love, but very little human indulgence.		<b>Selma Lagerlöf</b> (Swed.). (1858).— <i>Novels, Short Stories</i> .—World-wide renown. Original, romantic, imaginative, charming.		1859. Darwin's Origin of Species.
		<b>Eugene Brieux</b> (1858).— <i>Dramas</i> .—A vigorous playwright who faithfully depicts and attacks some of the bad sides of our modern civilization.		<b>Verner von Heidenstam</b> (Swed.). (1859).— <i>Novels, Short Stories, Poems</i> .—Chiefly historical prose.		
				<b>Gustaf Fröding</b> (Swed.). (1860).— <i>Lyrics</i> .—Harmonic mixture of elegant language of poetry with natural language of everyday life.		1861-5. Civil war in United States.
		<b>Edmé Doumic</b> (1860).— <i>Criticism</i> .—History of French literature and several volumes of literary criticism.		<b>Oskar Lererich</b> (Swed.). (1860-1906).— <i>Short Stories, Sketches, Literary Essays, Poems</i> .—Artistic and elegant use of the language. Perhaps Sweden's greatest literary critic.	<b>G. d'Annunzio</b> (It.). (1863).— <i>Novels, Poems, Tragedies</i> .—Realistic novels; powerful poetic tragedies.	
		<b>Marcel Prévost</b> (1862).— <i>Novels</i> .—One of the most successful of the younger generation of novelists.	<b>Gerhard Hauptmann</b> (1862).— <i>Dramas</i> .—Chief German dramatist of our day. His symbolist drama, <i>The Sunken Bell</i> is one of the most popular works of our time.			
		<b>Maurice Barrès</b> (1862).— <i>Novels</i> .—Penetrating psychology in his novels.		<b>Per Hallström</b> (Swed.). (1865).— <i>Novels, Short Stories, Lyrics, Dramas</i> .—Imaginative. Good in psychological analysis.		1867. Alaska purchased by the United States.
<b>Israel Zangwill</b> (1864).— <i>Novels, Dramas, Essays</i> .—As Jew, an exponent of the Zionist movement. Successful in the essay and especially in the novels depicting Jewish scenes and characters.		<b>Henri de Régnier</b> (1864).— <i>Novels, Poems</i> .—A symbolist poet of shadows and dreams.				1870. Franco-Prussian war.
<b>Rudyard Kipling</b> (1865).— <i>Novels, Stories, Poems</i> .—A vigorous, audacious, efficient writer. The most original genius among English literary men of to-day.						1871. Republic proclaimed in Spain.
<b>Stephen Phillips</b> (1865).— <i>Essays, Poems, Poets and Poets</i> .—Lyric tragedies in blank verse, akin in spirit to the French classic drama.		<b>Edmond Rostand</b> (1868).— <i>Dramas</i> .—With his <i>Cyrano de Bergerac</i> runs the prediction of a revival of the Romantic drama.			<b>Maxim Gorki</b> (Russ.). (1868).— <i>Tales, Novels</i> .—Masterful presentation of the life of those cast out by society.	1876. Centennial exposition at Philadelphia.
		<b>Henri Bernheim</b> (1874).— <i>Dramas</i> .—A dramatic artist of powerful works.				

king of Denmark, after the death of her former husband. Claudius prepared poisoned wine, which he intended for Hamlet; but the queen, not knowing it, drank it, was poisoned and died. Hamlet, seeing his mother fall dead, rushed on the king and killed him almost by accident, and is killed himself, but is reinstated again in the hands of Justice.

well by a pomohed rapier in the hands of Lartea.  
**Hard Times.**—A novel by Dickens. Bounderby,  
 a cruel and avaricious man, is the banker of the  
 place. When past fifty years of age he married  
 Louisa, daughter of Thomas Gradgrind. The  
 bank was robbed, and Bounderby believed Stephen  
 Blackpool to be the thief, because he had dismissed  
 him from his employ. The culprit was Tom  
 Gradgrind, the banker's brother-in-law, who escaped  
 out of the country. In the dramatised version,  
 the bank was not robbed, and the money was  
 sent to another drawer for safety.

**Heart of Midlothian, The.**—A novel by Sir Walter Scott, published in 1818. It has for heroine Jeanie and Effie Deans. Among the other characters are Dumbiedykes and Madge Wildfire. It has often been dramatised. "The Heart of Midlothian" was the popular name for the tollbooth at Edinburgh, the capital of the county of Midlothian.

**Hiawatha, The Song of.**—A poem by Henry Wadsworth Longfellow, written in the following peculiar measure:

Should you ask me, "Whence three stories?"

I should answer, I should tell you.

"I repeat them as I heard them."

The poem is entirely devoted to a description of life among the aboriginal tribes of America. It was published in 1855. Hiawatha is a mythical person believed by some of the North American Indians to have been sent among them to clear their rivers, forests, and fishing-grounds, and to teach them the arts of peace. When the white man came they were at war, but at the time of his departure was at hand when the trust was

To the kingdom of Ponemah.

**Highland Mary.**—A song by Robert Burns, which Burns himself thought was in his happiest manner, and which refers, he says, to one of the most interesting passages of his youthful days. By this he means his attachment to Mary, a servant in the family of Mr. Hamilton, who would be remembered," says Burns, "with Dandie, Bessie, and Petrarck's Laura." It was arranged that the lovers should become man and wife, and that Mary should go to her friends to prepare for the wedding. But before her departure came the farewell scene so touchingly described in the poem:

Our parting was fu' tender;  
And, pledging aft to meet agai

We tore ourselves asunder:  
But oh! full death's not mine; I live.

That nipt my flower see earl

That wraps my Highland Ma

**Hohenlinden.**—A poem by Thomas Campbell, published in 1802, celebrating the battle of Hohenlinden, gained by Moreau and the French over the Austrians. The poet visited the battlefield on December 2, 1800.

December 3, 1800.  
**Home, Sweet Home.**—A popular lyric contained in the drama of *Clari, the Maid of Milan*, by John Howard Payne. The beautiful melody to which it has been wedded is said to be of Italian or Sicilian origin, though by some it is attributed to Sir Henry Rowley Bishop. Perhaps the latter merely arranged and harmonized it.

[illegible]

**Hypatia.**—A novel by the Rev. Charles Kingsley, the scene of which is laid in Alexandria, at a time when Christianity was gaining ground against Paganism and the neo-Platonism of the schools. Hypatia herself was born about the year 370, and, after attracting to her lectures on philosophy a large and brilliant auditory, was torn to pieces by the rabble of her native city in 415. *Hypatia* appeared in 1853.

**Hyperion.**—A romance in four books, by Henry Wadsworth Longfellow. This work, which was the result of an extensive tour in Germany, was published in 1839, and, with much that is purely fanciful and imaginative, contains much that came within the actual experience of the author.

who is represented, idealized, in the character of Paul Flemming. The episode with Mary Ashburton is supposed to have reference to a real occurrence. The book is full of description and of eloquent discussion, besides being interspersed with sketches of legend and of song.

**Idylls of the King.**—A series of poems by Tennyson. Taken together they form a parable of the life of man. Each idyll taken as a separate picture represents the war between sense and soul. In *Lancelot and Guinevere* the lower nature leads them astray and there is intense struggle before the higher nature prevails. In *Vivien, Tristan, and Modred* the base and sensual triumph. In *Arthur, Sir Galahad and Percivale*, it is the victory of the spiritual.

**Head.**—A famous Greek epic poem by Homer. It is the tale of the siege of Troy, in twenty-four books. It is written in Greek hexameters, and commemorates the deeds of Achilles and other Greek heroes at the siege of Troy. Books one, two, and three are introductory to the war. Paris proposes to decide the contest by single combat, and Menelaus accepts the challenge. Paris, giving orders to his army, carried off by Venus, and Agamemnon demands the return of Helen. Achilles gives up Troy in fulfillment of the compact, and the siege follows. The gods take part, and frightful slaughter ensues. At length Achilles slays

Hector, and the battle is at an end. Old Priam, going to the tent of Achilles, craves the body of his son Hector; Achilles gives it up, and the poem concludes with the funeral rites of the Trojan hero. Vergil continues the tale from this point, shows how the city was taken and burnt, and then continues with the adventures of Aeneas, who escapes from the burning city, and makes his way to Italy.

**Ingotideby Legends.** The collection of legends in prose and verse, supposed to have been found in the family chest of the Ingotideby family, and related by Thomas Ingotideby. Of the poetical pieces it is not too much to say that, for originality of design and diction, for quaint illustration and musical verse, they are not surpassed in the English language. From the days of Hudibras to our time, the drollery invested in rhyme has never been so amply or so felicitously exemplified; and if derision has been unsparringly applied, it has been to lash knavery and imposture.

**Memoriam.**—A poem by Alfred Tennyson, published in 1850, and consisting of one hundred and thirty "short swallow-flights of song," is a measure which Tennyson has made his own. It is well known that these "brief lays, of sorrow born," were written in memory of the author's friend, Arthur Henry Hallam, who died in 1833. They are characterised by George MacDonald as forming "the poem of the hoping doubters, the poem of our age—the grand minor organ-fugue of

*In Memoriam.* It is the cry of the bereaved Psyche into the dark infinity after the vanished love. His friend is nowhere in his sight, and God is silent. Death, God's final compulsion to prayer, in its dread, its gloom, its utter stillness, its apparent nothingness, urges the cry. Mournings over the dead are mingled with the profoundest

questionings of philosophy, the signs of nature, and the story of Jesus, while now and then the star of the morning, bright Phosphor, flashes a few rays through the shifting cloudy dark. And if the sun has not arisen on the close of the book, yet the aurora of the coming dawn gives light enough to make the onward journey possible and hopeful."

**Innocents Abroad.**—By Mark Twain. Travelers see Europe without any illusions. The fun consists in an irreverent application of modern common sense to historic associations, ridiculing sentimental humbug. An air of innocence and

**Instauratio Magna.**—The title (*The Great Restoration*) which Bacon gave to his *Magna Opus*, the design of which was for six divisions:—(1) *The Advancement of Learning*; (2) the *Novum Organum*; (3) the *Experimental History of Nature*; (4) the *Scala Intellectus*, which leads from experience to science (5) the *Baconic*, or anticipations of the second philosophy; and (6) *Active Science*, or experiment. Of these, only the first two, and

the portion of the third (*Sylvia Sylvestris*), were published. The idea that was to run through the *Intestines* was that invention must be based on experience, and experience must be based on invention. The hero is Sir Walter Sprotton. There, also, Ivanhoe, figures as Cedric of Rotherwood's disinherited son, the favorite of King Richard I., and the lover of the Lady Rowena, the daughter of the Sheriff of Norwiche. He was in England in the reign of Richard I., and we are introduced to Robin Hood in Sherwood forest, banquets in Saxon halls, tournaments, and all the pomp of ancient chivalry. Rowena, the heroine, is a young girl who is shaded by the gentle, mask, yet high-souled Rebecca.

**Jekyll, Doctor, and Mr. Hyde.**—A singular romance by Robert Louis Stevenson. The hero is a duplex character.—Dr. Jekyll and Mr. Hyde. Doctor Jekyll is a benevolent and upright physician, who by means of a potion is able to transform himself for a time into a second personality,

**Jerusalem Delivered.**—An epic in twenty books, by Torquato Tasso. The crusaders, encamped on the plains of Tortosa, chose Godfrey for their chief, and Alandine, king of Jerusalem, made

preparations for defense. The Christian army having reached Jerusalem, the king of Damascus sent Armida to beguile the Christians. It was found that Armida could never be taken without the aid of Rinaldo. He was so enamored that the hero was dallying with Armida in the enchanted island, sent to invite him back to the army; he refused. Armida then sent him to the East, and fled into Egypt, and offered to marry any knight who slew Rinaldo. The love of Rinaldo returned, he pursued her and she resisted. The poem concludes with the king of Damascus sending his army into the Holy City, and their devotions at the tomb of the Redeemer. The two chief episodes are the love of Armida and Sofronia, and of Tancred and Clorinda.

Julius Caesar.—An historical tragedy by William Shakespeare. The poet was in this, as in other plays, materially assisted by North's translation of Plutarch. "Shakespeare's *Julius Caesar*," says Halliwell, "is not equal, as a whole, to either of his other plays taken from the Roman history. It is inferior to *Antony and Cleopatra* in interest and power, and to *Antony and Cleopatra*. It, however, abounds in admirable and affecting passages, and is remarkable for the profound knowledge of character, in which Shakespeare

could hardly fail."—A novel by Sir Walter Scott. This is a very early work of the *Scotts* and *The Monastery*. For interest it comes next to *Kenilworth*, and the portrait of Queen Elizabeth is lifelike and correct. One of the chief beauties of the novel is the use of courtly gayeties and splendor, the novel contains the unhappy tale of the beautiful Amy Robsart, which cannot fail to excite our sympathy and pity. King Henry is a noble and generous monarch. Cordelia is a fabulous or legendary king of Britain. He had three daughters, and when four score years old, he was planning to divide his kingdom among them, but was persuaded to disinherit Cordelia. She became a play-actress, and a character Cordelia, who is a perfect woman.

**edy of Lyons, The.**—A drama, by Lord Lytton. In which Pauline Desceppelloni, daughter of a French merchant, rejects the suitor of Beaumont, a British officer, and marries the French nobleman, Claude, who was a gardener's son, aided by the other, passed himself off as Prince Coma. married Pauline, and brought her home to his father's house. Beaumont, who was a bankrupt, indignant, and Claude left her to join the French army. He became a colonel, and returned to his father's house (where he was a bankrupt), and that Beaumont had promised to satisfy the creditors if Pauline would consent to marry him. Pauline was heartbroken; Claude had obtained the money required, and carried home the bride.

ady of Shalott. The.—A poem by Alfred Tennyson, founded on an incident in *King Arthur*. It is descriptive of "a being whose existence passes without emotion, without changes, without intelligible motive for living on, without hope or fear here or hereafter."

ady of the Lake, The.—A poem in six cantos by Sir Walter Scott, published in 1810. "Measured even by the standard of the *Minstrel and Marion*, the *Lady of the Lake* possesses," says Palgrave, "merits of its own, which raised his reputation still higher. Jeffrey's prediction has been completely fulfilled, that the *Lady of the Lake* would be 'objectively immortal' in the formative, and it is generally acknowledged to be, in Lockhart's words, 'the most interesting, romantic, picturesque, and graceful of his great poems.'"

The descriptions of scenery, which form one of the chief charms of the poem, render it, even now, one of the most minute and faithful hand-books to the region in which the drama of Ellen and the Knight of Snowdon is laid.

and the Knight to snowbirds is also  
 Moore, consisting of four tales in verse, entitled  
*The Votied Prophet of Khorassan, Paradise and the Peri, The Five-Worshippers, and The Lapis of the Harem*, and connected by a short prose narrative, in which it is described how Lalla Rookh, daughter of the Emperor Aurangzebe, journeyed to Buchar to meet her betrothed husband, and how the prince gained her love on the way, in the guise of a cashmieran minstrel. *Lalla Rookh* was published in 1817.

**Amour.**—A descriptive poem by John Milton, probably written during his college life.

**Amour Meecin** (*is-mor' mee-dan'*), (or, *The Young Doctor*).—A comedy, written about the year 1655. Lucinde, the daughter of Spanarelle, is in love, and the father calls in four doctors to consult upon the nature of her malady. They see the patient, and retire to consult together, and then take turns to talk of the various topics of the day; and when the father comes to know what opinion they have formed, they all prescribe different remedies, and pronounce different prognostics. The first doctor, a young doctor (Chitandre, the lover), who says that he must act on the imagination, and proposes a seeming marriage, to which Spanarelle assents. The assistant being a notary, Chitandre and

**East Days of Pompeii. The.**—A novel by Bulwer-Lytton, Edward George, Baron Lytton, which was published in 1834. The interest of the book is one of

And his eyes have all the seeming of a demon's  
that is dreaming.  
And the lamp-light o'er him streaming throws  
his shadow on the floor;  
And my soul from out that shadow that lies float-  
ing on the floor

**Religio Medici.**—A prose work by Sir Thomas Browne, "*The Religio Medici*," says the elder Lytton, "is one of the most beautiful prose poems in the language; its power of diction, its subtlety and largeness of thought, its exquisite conceits and images, have no parallel out of the writers of that brilliant age when Poetry and Prose had not yet divided their domain, and the Lyceum of Philosophy was watered by the mixing of the wine!"

**Representative Men.**—A work by Emerson which more nearly than any of his other works, gives expression to his system as a whole. The topics are: (1) Plato, the Philosopher; (2) Swedenborg, the Mystic; (3) Montaigne, the Skeptic; (4) Shakespeare, the Poet; (5) Napoleon, the Conqueror of the World; (6) Goethe, the Writer. The mental portraits sketched under these six heads give us Emerson himself, so far as he is capable of being formulated at all.

**Republic, The.**—A work composed by Plato 400 years before Christ. The *Republic* is not, as the title implies, a political work, but a treatise on the *Politics* of Aristotle. The principles and government of an ideal moral organism, of which the rulers shall be types of fully developed and perfectly educated men, is the real subject. In the *Republic* we find the necessity of virtue to the very idea of social life proved in the first book; then the whole process of a complete moral and political education of the rulers is described. It is said that the most complete record of the beliefs or opinions of Plato are found in this work.

**Reveries of a Bachelor.**—By D. G. Mitchell. The *Reveries* is a collection of sketches of life and character, painted in such a dreamlike, delicate manner as to make the reader lose for the time being the full consciousness of his surroundings. It has called forth a number of imitators more or less successful, no one of whom, however, is comparable to the original.

**Reynard the Fox.**—A beast-epic, so called. This prose poem is a satire on the state of Germany in the middle ages. Reynard represents the Church; Isengrin the wolf (his lion) typifies the baronial element; and Ysaak the lion stands for the papal power. The plot turns on the struggle for supremacy between Reynard and Isengrin. Reynard uses all his endeavors to victimize every one, especially his uncle Isengrin, and generally succeeds.

**Nichelleu** (or, *The Conspiracy*).—A drama in five acts, by Edward, Lord Lytton; produced in 1839; the part of the hero being played by Macready. For some of the incidents the author confessed himself indebted to the authors of *Cing Mare* and *Ferriola*. Among the characters are Haradad, the favorite of the Muezzin, in love with Julie; Julie de Mortemart herself; Mon de Lormes, mistress of Orleans; Orleans himself; Louis XIII., and others.

**Rights of Man, The.**—"Being an answer to Mr. Burke's Attack on the French Revolution," by Thomas Paine. This work, which was published in 1791-2, procured for the writer the distinction of a trial for sedition, which he escaped by flying to France.

King of the Book. The. A poem by Robert Browning, published in 1869. It is the story of a tragedy which took place at Rome in 1698. The verified narrative of the child Pompilia's abduction by Count Guido's priest, the violence of her rescue by young aristocrats, the cruel, lawful separation, the murder by Guido of the girl and her putative parents, the trial and condemnation of the girl's father, the affirmation of his sentence by the pope—all this is made to fill out a poem of 21,000 lines; but these include ten different versions of the tale, besides the poem's prologue, the epilogue, and the epilogue's outline of it. The chapters which contain the statements of the priest-forever and Pompilia are full of tragic beauty and emotion. The pope's chapter is a masterpiece of prose, and the last piece of literary metempsychosis.

**Rip Van Winkle.**—A tale by Washington Irving, adapted from the old German legend of Peter Klaus, a goatherd, who drank a miraculous draught of wine in a delf of the Hare mountains, which brought on sleep from which he did not wake until twenty years after, when he returned to his native village to find everything changed, and no one who knew him. In Irving's tale the hero is a Dutchman living in America, and the scene is the Catskill mountains. The story has been made into a picture, and has been effectively dramatized, the leading personage being illustrated by the genius of Jefferson.

**Hivals, The.**—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, in 1778, and described by Haslitt as "a play of even more action and incident, but of less wit and satire, than *The School for Scandal*." It is as good as a novel in the reading, and has the broadest and most palpable effect upon the stage.

**Roaring Camp, The Luck of.**—A prose sketch by Francis Bret Harte, an American poet, in which the softening effects of the presence of a little child in a camp of ruffians are very tonebly described. It has been dramatised for the New York stage.

**Rob Roy.**—A romance by Sir Walter Scott, which is founded on some passages in the career of the famous Highlander, Robert MacGregor, who was surnamed "Rob Roy." The heroine of the story is Diana Vernon, the heroine, Diana Vernon. Among the other characters are Bailie Nicol Jarvie, "The Dougal Cratur," and the "Black and White" of the title, Sir Frederick Vernon, and Rashleigh Oshadistotie. The novel has been dramatised in a version which still holds the stage in Glasgow, and is often spoken of as the "Rob Roy of the Scottish Stage." It is a story of the wealthy, but the friend of the poor, and possessed of many qualities, both of head and heart, who is at last proved to be a true and noble man, and then that to which his late condemned him."

**Romance of the Rose.**—A poetical allegory, begun by Guillaume de Lorris in the latter part of the thirteenth century, and continued by Jean Meung in the former half of the fourteenth century. The poet dreams that Dame Idleness conducts him to the palace of Pleasure, where he meets many adventures among the attendant maidens, Youth, Joy, Courtesy, and others, by whom he is conducted to a bed of roses. He singles out one, when an arrow from Love's bow stretches him fainting on the ground. Fear, Slander, and Jealousy are afterwards introduced.

**Romeo and Juliet.**—A tragedy by William Shakespeare. Romeo, a son of Montague, in love with Juliet, the daughter of Capulet; but between the houses of Montague and Capulet there existed a deadly feud. As the families were irreconcilable, Juliet took a sleeping draught, that she might get away from her parents and elope with Romeo. Romeo, thinking her to be dead, killed himself; and when Juliet awoke and found her lover dead, she also killed herself.

**Nemosa.**—A novel of Italian life and character by Giosuè Elci. Tells a marvellously able story of the revival of the taste and beauty and freedom of Hellenic manners and letters, under Lorenzo de' Medici and the scholars of his court, side by side with the revival of Roman virtue, and more than the ancient austerity and piety, under the great Dominican Savonarola. This period of history is one which all others may well be proud to have seen. It is the great East. Fringes of learning and discipline, amassed for mankind ages before, for ages stored and hidden away, see again the sun, are recognised and put to use.

What use they will be put to, with what new and fruitful effects on the state and the citizen, with what momentary and with what lasting consequences, this she strives to discover; this she follows through the public history of Italy during the modern invasion of Charles VIII., and the events which succeed his invasion, and through the private fortunes of her admirably chosen group of characters, some of them drawn from life, all of them true to nature.

Sagas.—Thus of the ancient traditions which form the substance of the history and mythology of the North, the sagas contain the best preserved remains. They are written in supposed to be the old Icelandic. In the *Edda* there are numerous sagas. A considerable number of the sagas are of a historical nature, songs, moral proverbs, and religious stories, so that the *Edda* contains the history of Norway, and the life of the great men of the country. The original *Edda* was compiled and edited by Harnud Sigfusson, an Icelandic priest who lived in the thirteenth century. It consists of twenty-eight parts or books, all of which are in verse. Of these, two hundred years later, Snorri Sturleson, a famous Icelandic poet, wrote a prose version, reduced to prose the *Edda*, and his work was called *The Younger Edda*. In this we find the famous story of the gods, and the lives of the heroes. Besides the sagas contained in the *Edda*, there are numerous others, and the whole saga literature is contained in a collection of books called the *Valdegar Saga*, which is a collection of lays about the early Teutonic heroes. The *Saga of St. Olaf* is a story of the life of the great king of Norway. The *Saga of the Volsungs* is a story of the life and adventures of Frithiof of Iceland. Snorri Sturleson, at the close of the thirteenth century, wrote a history of the sagas, and of chronicles in verse, called the *Heimskringling Saga*. This is a most valuable record of the laws, customs, and manners of the North.

**Sakuntala.**—A famous drama by Kalidasa. The daughter of Vyāmasita and a water-nymph who had been seduced by a hermit, she was brought up by a hermit. One day, King Dushyanta came to the hermitage, and persuaded Sakuntala to marry him. In due time a son was born, but Dushyanta left his bride at the hermitage. When the boy was six years old, his mother took him to the king, and Dushyanta recognised his wife by a ring which he had given her. Sakuntala was now publicly recognised queen, and the boy (whose name was Bharata), became the founder of the Chandra-vanshi dynasty. Bharata

**Samson Agonistes.**—A sacred drama by Milton. Samson, blind and bound, triumphs over his ene-

mies. As in the bible story, he grasps two of the supporting pillars, and perishes in the general ruin.

various *Resurrexits* (i. e., *The Tumor Patched*).—The title of an old Scotch ballad, being *The Last of the Opened* (i. e., *Hei! Tugendloschick*) in *The Books*, by Thomas Carlyle. It may be described as a kind of philosophical romance, in which the author gives us, in the form of a review of a supposed German work on dress, and a notice of the writer, his opinions on things in general. The hero, it has been said, seems to be intended for a portrait of human nature as exhibited by the author's audience; and such an cultivated mind would be exposed by acquaintance with the transcendental philosophy of Fichte.

**Scarlet Letter.**—The *A* romance by Nathaniel Hawthorne, published in 1850. The heroine, Hester Prynne, was condemned to wear certain marks as mother of her child, Pearl, whose father was not known. She was first exposed in disgrace, and afterward gained a moderate support for herself and child by embroidering. She was pardoned for her crime, but when she might then be allowed to lay aside the letter, H was always near, held as important position. Her husband, Arthur Dimmesdale, a minister, died. Hester Prynne took her child to another country, but returned to spend her old age in seclusion and contemplation. Pearl was brought back to her mother, and Dimmesdale was posthumously vindicated. She always bore herself proudly, but not defiantly, and refused to herself such love and respect that she regarded as her own. Her daughter, Pearl, a beautiful, worth, Hester's husband, appeared as a learned foreign physician, visited her in prison, but promised her to learning her secret. The characters in the story are intense, and the analysis of motives

**Schlemihl, Peter.**—The title of a little work by Chamisso, and the name of its hero, a man who sells his shadow to an old man in gray (the devil) who meets him just after he has been disappointed in an application for assistance to a nobleman. The name has become a byword for any poor, silly, and unfortunate fellow.

**Señor for Scoundrel, The.**—A comedy by Richard Brinsley Sheridan, produced at Covent Garden, London, 1777. Characterized by Hailstone as, "if not the most original, perhaps the most finished and faultless comedy which we have." The scene in which Charles Surface sells all the old family pictures but his uncle's, who is the purchaser, in disguise, and that of the recovery of Lady Teazle's jewels, are well told. "The play is the happiest and most highly wrought that comedy, in its wide and brilliant range, can boast. Besides the art and ingenuity of this play, there is a genial spirit of frankness and generosity, that relieves the heart as well as the lungs." While it is a comedy, it is not a comedy by any means, it inspires a confidence between man and man.

school for Wives (*L'École des Femmes* (training for wives)). A comedy by Molière. Arnolph has a crotchete about the proper training of grooms to make good wives, and tries his scheme upon Agnes, whom he adopts from a peasant's cottage. He sends her from early childhood to a convent, where difference of sex and the conventions of society are wholly ignored. When removed from the convent, and taken back, they were so well acquainted, that she treats him as a friend, and treats them with girlish familiarity. The consequence is, a young man named Horace falls in love with her, and makes her his wife, and

**Jealous of Husbands** (*L'École des Maris* (wives trained by men)).—A comedy by Molière. Ariste and Scapellato, two brothers, bring up Léonor and her sister, and teach them to conform to the social systems for making them in time their model wives. Scapellato's system was to make the woman dress plainly, live retired, attend to domestic duties, and have few indulgences. Ariste's system was to give the woman great liberty, and trust to her honor, Isabelle, brought up by Scapellato, deceived him and married another; but Léonor, brought up by Ariste, made him a faithful wife.

**Scottish Chiefs, The.**—A romantic story by Jane Porter, published in 1810, and counting among its heroes Robert Bruce and Sir William Wallace.

**Seasons, The.**—A series of poems by James Thomson, which appeared in the following order: *Winter*; *Summer*; *Spring*; and *Autumn*; the whole being republished, with the famous *Hymn*. Horace Walpole said that he would rather have written the most absurd lines by Lee than *The Seasons*; but Wordsworth, on the other hand, speaks of it as "a work of inspiration; much of it," he says,

**Sentimental Journey Through France and Italy.**—By Laurence Sterne, published in 1768. Sterne describes this work as follows: "It is a subject which works well, and suits the frame of mind in which I have been for some time past. I told you my design is it was to teach us to love

**Alelca.**—A fairy represented as carrying off Astolfo. She reappears in great splendor in Ariosto's *Orlando Furioso*.

**Aldibonathophosphoreum.**—A character in Henry Bury's burlesque of *Don Quixote*, called by the title of *Aldibonath*.

**Aldingar, Sir.**—A character in Percy's *Reliques*. This ballad relates how the honor of Queen Eleanor, wife of Henry Plantagenet, was saved by Sir Aldingar, her steward, who submitted to the chance of a duel, and how an angel, in the form of a little child, saved her from his claspings, and established her innocence.

**All Baba's.**—A poor Persian woodcarver of the Arabian Nights. He is recommended to leave the magic words, "Open Sesame!" "Shut Sesame!" by which he gains entrance into a vast cavern, the repository of stolen goods, and the lair of forty thieves. He makes himself rich by plundering from these stores; and by the shrewd cunning of Morgiana, his female slave, he obtains and his whole band of thieves are extirpated. In reward of these services, All Baba gives Morgiana her freedom, and marries her to his own son.

**Alice Braud.**—In Scott's *Lady of the Lake*, Alice signed Urgan the dwarf thrice with the sign of the cross, and he became "the fairest knight in all Scotland"; when Alice recognised in him her own brother, and married her to his own son.

**Alan-a-Dale.**—A friend of Robin Hood's in the ballad. He is introduced into Sir Walter Scott's *Invaders* as Robin Hood's minstrel.

**Alworthy, Mr.**—In Fielding's novel of *Tom Jones*, a man of amiable and benevolent character; intended for Mr. Ralph Allen, who was also celebrated by Pope.

**Almighty Dollar.**—A personification of American worship. Washington Irving originated the phrase in *The Great Valley*.

**Alp.**—Sveig of Corvyn, British. The hero of this poem.

**Amadis de Gaul.**—The hero of an ancient and celebrated Portuguese romance. A French version was printed in 1553.

**Amazilia.**—A young woman who impersonates spring in Thomson's *Seasons*.

**Amoryllus.**—In Spenser's pastoral *Cloth Clove's Great Home*, Amoryllus is the cousin of Desly. Her name was Alice, and she was the youngest of the six daughters of Sir John Spenser, of Althorpe, ancestor of the noble house of Spencer and Marlborough. After the death of the earl, the widow married Sir Thomas Greville, keeper of the great seal (afterward baron of Greville and Viscount Brackley). It was for this very lady, during her widowhood, that Milton wrote his *Lycidas*.

**Amrose.**—A sharper in *Tom Jones*. *Amrose*, who assumed in the presence of Gill Bliss the character of a devotee. He is a scoundrel, who, in the disguise of the name of Don Raphael, and a young woman who called herself Camilla, cousin of Donna Amrose. These three characters, Gill Bliss assumed the name of Don Raphael, and a young woman who called herself Camilla, cousin of Donna Amrose. These three characters, Gill Bliss assumed the name of Don Raphael, and a young woman who called herself Camilla, cousin of Donna Amrose.

**Amelia.**—The title of one of Fielding's novels, and the name of its heroine. Amelia is distinguished by her tenderness and affection. The character of Amelia is said to have been drawn from Fielding's wife.

**Amle.**—In Arabian Nights a female character who leads her three sisters by her side as a leash of hounds.

**Amleite.**—See *Précieux Ridicules*. Molière, A contradictory character in this comedy. She discusses her admirers for proposing to marry her, scolds her uncle for not carrying himself as a gentleman, and marries a valet whom she believes to be a nobleman.

**Amlet, Richard.**—The name of a gamster in Vanbrugh's *Confederacy*.

**Annet.**—(1) The name of a lady married to Sir Beudamere, in Spenser's *Fairy Queen*. She is the title of a devoted, loving wife. (2) The heroine of Fletcher's pastoral *Love's Pastoral Shepherdess*.

**Amys and Amylion.**—Two faithful friends. The Flies and Orestes of the *tragedy*. Their adventures are the subjects of ancient romances.

**Ancient Mariner.**—The chief character in Coleridge's *King of the Deserted Island*. (See under Famous Books, Poems, etc.)

**Amant Man.**—In Tennyson's *Idylls of the King*, means Merlin, the great magician, King Arthur's protector and teacher.

**Andrews, Joseph.**—The hero in Fielding's novel by the same name, written to ridicule Richardson's *Pamela*. Fielding presents Joseph Andrews as the title of the mother to the mother of *Pamela*, and pictures him as a model young man.

**Angelica.**—In Bojardo's *Orlando Innamorato*, is the daughter of Ginepro, king of Sicily, who goes to Paris, and Orlando falls in love with her. Forgetful of wife, sovereign, country, and glory, Angelica, on the other hand, is loved by Orlando, but passionately loves Rinaldo, who positively dislikes her. Angelica and Rinaldo drink of certain fountain, whereupon they are changed in their hearts, for then Rinaldo loves Angelica, while Angelica loves all love for Rinaldo. (2) The heroine of Congreve's comedy, *The Love for Love*, in love with Valentine, but the ward of Sir Sampson Legend, who seeks to marry her. She kills the old man, however, and marries the

younger lover. Angelica is supposed to represent Mrs. Mordaunt. Valentin, the author, was the rival of the dramatist, Rowe, in her affection. (3) The heroine of a novel by the same name, who was beloved by Orlando, but married Medoro. Also the name of the heroine of Targuier's plays of the same name, who was the subject of a needie. He was also called the Angel of the Rebekah.

**Angelica Doctor.**—A name bestowed upon Thomas Aquinas, because he discussed the knotty point of the angel's single eye, and the point of a needie. He was also called the Angel of the Rebekah.

**Ann.**—A character in Shakespeare's *Measure for Measure*; also the name of a goldsmith in the *Comedy of Errors*.

**Annabel Lee.**—The title and subject of a poem by Edgar Allan Poe, which begins in this way: "It was many and many a year ago, In a kingdom by the sea."

That a maiden there lived whom you may know By the name of Annabel Lee.

**Anne.**—Perrault's *Le Barbe Bleue*, the sister of Fatima, the seventh and last of the seven daughters of a king, having disobeyed her lord by looking into the locked chamber, is allowed a short respite before execution. Sister Anne ascends the high tower of the castle, with the hope of seeing her

sister, whom she expected to arrive every morning. In her attempt, she is killed by the "sister Anne" if she can see them, and Bluebeard keeps crying out for Fatima to use greater dispatch. At the close of both tales, the king comes to arrive, and Fatima is rescued from death.

**Annie Laurie.** eldest of the three daughters of Sir John Laurie, of Craigheroch, and was the mother of Alexander Ferguson, the hero of the *Waverley*. The song of *Annie Laurie* was written by William Douglas, of Fingland, in the epilogue of *Kirkcubright*, hero of *Scotland's*.

**Antipholus of Ephesus, Antipholus of Syracuse.**—Twin brothers, sons to Egeon and Antis, in Shakespeare's *Comedy of Errors*.

**Antiope.**—(1) The merchant of Venice in Shakespeare's play of that name, the friend to Bassanio, and the object of Shylock's hatred. (2) The usurping Duke of Milan, and brother to Prospero, in Shakespeare's *Tempest*. (3) The father of Pericles, in Shakespeare's *Pericles*. (4) A minor character in Shakespeare's *Much Ado About Nothing*. (5) A sea-captain, friend to Pericles, in Shakespeare's *Pericles*.

**Archimago.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Archimago.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Arcturion.**—A character in Spenser's *Fairy Queen*, a hypocrite or sorcerer. He is introduced in the Red Cross Knight, wins the confidence of the knight in the disguise of a reverend hermit, and helps him to defeat the Duke of Ufford, separates him from Una, or Truth.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Guendolen.**—A fairy whose mother was a human being.

**Malte.**—In German legend, an archbishop of Meits in the tenth century who, for his hardness to poor and rich alike, was banished to the east by mice in the "Mouse Tower" on an island near Rhine near Bingen. His cruelty has made this legend the subject of a poem.

**Marek.**—The Dane.—A fisherman, known as a rescuer of the drowned, was adopted by the king of Denmark, and when the boy was restored to his royal sire, Grims was the name which he built the town which he called after his own name. This is the foundation of the medieval tales in *Hamlet* the Dane.

**Marewood.**—Sir Robert.—The old baronet of Marewood.

**Marewood, Charles.**—Guy Manning. Scott, son of Sir Robert. In love with Lucy Bertram.

**Heart of Midlothian.**—The tollbooth, or old jail of Edinburgh, Midlothian being the old name of Edinburgh county. It is the title of one of Sir Walter Scott's novels.

**Heep.**—Urbah.—David Copperfield, Dickens. A detestable character, who, under the garb of the most abject humility, conceals a diabolical malignity. Mrs. Heep, Urbah's mother, was a character equally to be despised for her hypocritical assumption of humility.

**Helen.**—(1) A lady in Shakespeare's *Midsummer Night's Dream*, loved by Demetrius. (2) The heroine of Shakespeare's *All's Well That Ends Well*, in love with Bertram, who marries her against his will and leaves her, but is won back by the strength of her affection. (3) A character in an old popular tale, reproduced in Germany by Tieck.

**Helen and Dorothea.**—The hero and heroine of Goethe's poem of the same name.

**Hermegild.**—*Canterbury Tales*, Chaucer. The wife of the lord-constable of Northumberland. She was converted by Constantine, but was murdered by a knight, Hermegild at the bidding of Constantine restored again to a blind Brind.

**Hermione.**—A lady in Shakespeare's *Midsummer Night's Dream*, in love with Lysander.

**Hernando.**—The heroine of the first three acts of Shakespeare's *Henry VIII.*

**Hernani or Hernani.**—The hero of Victor Hugo's drama of the same name, and of the opera, founded on the play. He was a Spanish noble in revolt against the Emperor Charles V. and killed him from a high seat of honor.

**Hilda.**—A New England girl of the most sensitive delicacy and purity of mind, in Hawthorne's *Mosses from an Old Manse*.

**Hildebrand.**—The hero of German romance, a champion and champion.

**Hildebrand.**—In an old German legend, the monk of Hildesheim, doubting how a thousand years ago with God could be so kind to the melody of a bird, as he supposed, for only a thousand years, but found he had been listening to it for a hundred years.

**Hobbes.**—The name of one of the fends mentioned by Shakespeare in *Love*, and taken from the history of the Jesuits' impostures.

**Hobbes.**—A famous German kobold, or domestic fairy-servant, so called because he always wore a little felt hat pulled down over his face.

**Hobbes.**—(1) A pedant living in France, under whose care Gargantua is placed for instruction. (2) A pedantic schoolmaster in Shakespeare's *Love's Labor's Lost*.

**Holt, Felt.**—The hero of George Elliot's novel by the same name.

**Homer.**—The later entries in the *Peterborough Chronicle* and a few homilies are almost all that we have left of the literature of the twelfth century. Some of these homilies are copied or imitated from those of *Willelme*.

**Honeycomb, Will.**—One of the members of the literary club who were the subject of a satirically edited. He is distinguished for his graceful affectation, courtly pretension, and the design of the eye.

**Honeyman, Charles.**—A fashionable preacher in *Blackbury's* novel, *The Newcomes*.

**Honeyman.**—A pious but hypocritical *Virgin's Progress*, who accompanies Christian to the end of his journey.

**Hop-o-my-thumb.**—A character in the tales of the nursery. Tom Thumb and Hop-o-my-thumb have the same name, although they are often confounded. Tom Thumb was the son of a peasant, knighted by King Arthur, and was killed by a giant. Hop-o-my-thumb was a boy of the same name as the German "däumling," the French "le petit pouce," and the Scotch "Tom-in-ee" or "Tommy." He was not a handsome boy, but a good one.

**Hornet.**—*Hamlet*, Shakespeare. An intimate friend of Hamlet, a prince, a scholar, and a gentleman.

**Hornet.**—*Hamlet*, Shakespeare. A man who came over the Tiber. He and two men to help him held the bridge against vast approaching armies.

**Hornet, Jack.**—The name of a celebrated personage in the literature of the nursery. A benevolent philanthropist says that the plume which Jack Hunter pulled out of the Christmas pie alluded to the title of the abbot of the abbey of St. Albans, which was given to Henry VIII. in a party, and were attracted on the way by the messenger, a certain Jack Hunter.

**Hortense.**—*Black House*, Dickens. The vindictive French maid-servant of Lady Dedlock. She was the subject of a parody about her by Lady Dedlock. Rosa, Hortense murdered Mr. Tulliver, and drew the suspicion of the crime on Lady Dedlock.

**Hortense.**—A prince in the Arabian Nights who would marry his wife's white-servant he wished.

**Hubbard, Old Mother.**—A well-known nursery rhyme. The subject of a parody about her by Edmund Spenser, is a satirical ballad in the style of Chaucer.

**Hubert de Burgh.**—Justice of England, created Earl of Lincoln, was introduced by Shakespeare into *King John*. He is the one to whom the young prince addresses his pious plea for his life. He is killed by Richard, the first duke, by accident or foul play.

**Hudibras.**—The legend of Saint Hubert makes him a patron saint of huntmen.

**Hudibras.**—The title and hero of a celebrated satirical poem by Samuel Butler. Hudibras is still his favorite of the time of the commonwealth.

**Hugh of Lincoln.**—A legendary personage, the subject of Chaucer's *Prologue*, *Parson's Tale*, and also of an ancient English ballad. Wordsworth has given a modernized version of this ballad.

**Hugo Huguenot.**—*Caste Dangerous*, Scott. Minstrel of the earl of Douglas.

**Hump.**—The subject of a collection of the tales in *Master Humphrey's Clerk*, by Charles Dickens.

**Humpty Dumpty.**—The hero of a well-known nursery rhyme. The name signifies a humped and dumpty and is the riddle for an egg.

**Hun of Bordeaux.**—Sir.—A hero of one of the legends of the time of the crusades.

**Hural Oryan.**—In the fairy tales found in the Koran, these are the black-eyed daughters of Oryan, who are created from mud, and are free from all physical weakness and are always young. It is held out to every male believer that he will have a hundred of these girls as his household companions in paradise.

**Hylas.**—A beautiful boy, beloved by Hercules, who was drawn into a spring by the enamored nymphs. The story has been treated by Bayard Taylor, and by William Morris in his *Life and Death of Hylas*.

**Hypocrit.**—The Feast of Purification is called *Feast of Hypocrit*.

**Hypocrit.**—The myth has formed a favorite theme for English poets. In Keats' *Hyperion* nature and classic imagery are combined with the myth.

**Hypocrit's Isle.**—An island described by Rabelais in one of his satires. He pictures this island of the world inhabited by the most vicious and debilitated natures, as by sham-saints, spiritual comedians, seducers, and such-like sorry rogues who have been driven to the island of the *Isle of Lament*.

**Hypocrit.**—Shakespeare. Othello's enigm and the villain of the play. Iago is said to be a character next to a devil, yet not quite a devil, which Shakespeare alone could conceive without scandal.

**Idleness.**—The Lake of.—*Patric Queens*, Spenser. Whoever drank thereof grew instantly "faint and weary." The Red Cross knight drank of it and was readily made captive by Orgoglio.

**Idleness.**—*Patric Queens*, Spenser. Fosterer of Orgoglio, Spenser says this old man walks one day and looks another, because idleness is always "wrong-headed."

**Imogen.**—The wife of Ptochomus, and the daughter of Cymbeline in the play of Shakespeare's under title *Cymbeline*. "Of all Shakespeare's women," says the poet, "she is, perhaps, the most tender and the most artless."

**Impratori.**—Poets who utter verses without previous preparation on a given theme. Among the Greeks, the Greeks were the subject of a parody. In modern times, it has been almost entirely confined to Italy, where Petrarch was the first to practice of singing improvised verses to the lute.

**Incantation.**—Is derived from a Latin root meaning "to enchant." It is the term used to denote one of the most powerful and awe-inspiring modes of magic, resting on a belief in the mysterious power of words solemnly conceived and passionately uttered.

**Incense Rock.**—It is dangerous for navigators, and therefore the sailors of the Alps are called to a hill on a storm, where they go to sleep. Southey says that Ralph the Rover, in a mist, fell into the sea, but on his return voyage his boat ran on the rock, and Ralph was drowned. Presumably, the rock is the same as the *Incense Rock*.

**Inferno.**—*The Divine Comedy*, Dante. Epopee in thirty-four cantos. Inferno is the place of the souls who are where they go to. The ascent is through Purgatory to Paradise.

**Interludes.**—The springing from the moralities and the religious plays, these were, however, never the regular drama, are the interludes, a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Interludes.**—The interludes were a class of compositions in dialogue, much shorter than the regular drama, and farcical. They were usually played in the intervals of a festival.

**Iphigenia.**—The heroine of Euripides' tragedy *Iphigenia at Aulis*, and of Goethe's tragedy *Iphigenia at Aulis*. Her place on the altar in a rash vow by her father, Artemis at the last moment saved her from sacrifice, and she went to heaven, substituting a hind in her place. The similarity of this legend to the offering of Isaac by Abraham is noticeable.

**Iras.**—A strongly delineated character in *Ben Hur*, by Lew Wallace.

**Iras.**—A female attendant on Cleopatra in Shakespeare's play, *Antony and Cleopatra*.

**Isaac.**—The name of Isaac, the father of Rebecca, in Sir Walter Scott's novel, *Isaac*.

**Isabelle.**—The heroine in Shakespeare's comedy, *Measure for Measure*.

**Island of Lanterns.**—In the celebrated satire of Rabelais, the subject of an old and widely spread legend of the middle ages. Though the island was probably suggested by the *City of Lanterns*, in the Greek romance of Lorian, it has copied this same idea in his *Island of Lapis*.

**Island of St. Brendan.**—A marvelous flying island, the subject of an old and widely spread legend of the middle ages. Though the island of St. Brendan has been a disappointment to voyagers, it has been a favorite theme with poets.

**Island of the Blist.**—Imaginary island in the west. Hither the favorites of the gods were conveyed to live in the bliss of the gods, and ending joy. The name first occurs in *Heard's Works and Days*. This phrase is often used in the same sense.

**Ithuriel.**—In Milton's *Paradise Lost*, an angel commissioned by Gabriel to search through purgatory for the serpent, to find Satan, who had eluded the vigilance of the angelic guard, and effected an entrance into the garden. It is related that Ithuriel found Satan "as he lay, close, dead at the ear of Eve," and transformed him by a touch of his spear into his proper shape.

**Irry Gate of Boreas.**—*Dream*, which depicts a passage through the ivory gate, but those which come true through the horn gate.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jack Robinson.**—A famous comic song by Hudson. Jack Robinson, a famous comic song by Hudson.

**Jack and the Beanstalk.**—A nursery legend said to be an allusion to the Teutonic *Alfader*, the "red hen" representing the all-producing sun, the "monster" being the fermenting rain, and the "harp" the winds.

**Jack-in-the-Box.**—A prominent character in Maypole and Mayday.

**Jessica.**—The beautiful daughter of Shylock, in Shakespeare's *Merchant of Venice*.

**Jesse, Sam.**—The hero of a novel entitled *The History of a Foundling*, represented as a model of generosity, openness, and manly spirit, though thoughtless and childish in his feelings.

**Joyeuse.**—The sword of Charlemagne as mentioned in romances of chivalry.

**Joyeuse Garde, La.**—The residence of the famous Lancelot du Lac.

**Judith.**—The heroine in the book by the same name in the *Apocryphal History*, was a beautiful Jewess of Bethulia, who, when her town was besieged by Holofernes, the general of Nebuchadnezzar, attended him in his tent, where he was drunk, killed him, whereupon her townsmen fell upon the Assyrians and defeated them with great slaughter. The subject is not mentioned by Josephus, and has, from an early period, been held to be an allegory. It has frequently furnished poets and painters with material.

**Kadr, Al.**—The night on which the Koran was sent down to Mohammed. Al hadr is supposed to be the seventh of the twelve nights of Ramadan, of the night between the twenty-third and twenty-fourth days of the month.

**Key.**—A foster brother of King Arthur, and a rude and boastful knight of the Round Table. He was the butt of King Arthur's court. Called also Sir Quous. He is never mentioned by *de la Morte*, in *Perce's Reliques*. Sir Key is represented as the type of rude boastfulness. Sir Gaius of courtesy, Sir Lauchance of chivalry, Sir Mordred of treachery, Sir Gaius of chastity, Sir Mark of cowardice.

**Kekama.**—A Hindoo rajah who obtains and sports with supernatural power. His adventures are related in Southey's poem entitled *The Curse of Kekama*.

**Kent, Earl of.**—A rough, plain-spoken, but faithful nobility in the reign of Henry VIII. He follows the fallen fortunes of the king, disguised as a servant, under the assumed name of Caius. **Kewpie.**—A fairy who is mentioned by *de la Morte*, in *Perce's Reliques*, including a number of little girls who differed from one another only in the length of their curled tresses. The subject of their fancies paginated with bows of blue ribbon.

**Kilkenny Cats.**—Two cats, in an Irish story, which fought till one appeared left but their tails. It is probably a parable of a local contest between Kilkenny and Inishowen, which impoverished each borough.

**Kilmansiegh, Miss.**—An heiress with great expectations and an artificial leg of solid gold, in Hood's poem, *A Golden Leg*.

**King Horn.**—A metrical romance which was very popular in the thirteenth century. King Horn was a beautiful young prince who was driven into piracy; but his life is spared, and after many wonderful adventures he weds a princess, and resumes his father's kingdom.

**King Log and King Skirk.**—Characters in a celebrated fairy tale, which relates that the frog, grown weary of his courtship, petitioned Jupiter for a king. Jupiter accordingly threw down a log among them, which made a satisfactory ruler till the frogs recovered from their fright and discovered his real nature. They, therefore, entreated Jupiter for another king, whereupon he sent them a stick, who immediately began to devour them.

**Klaus, Peter.**—The hero of an old popular tradition of Germany—the prototype of Rip Van Winkle—represented as a goatherd.

**Kuckersbecker, Friedrich.**—The imaginary author of a humorous fictitious *History of New York*, written by Washington Irving.

**Knight of the Swan.**—Lohengrin, son of Parsival, because his boat was drawn by a swan.

**Knights of the Round Table.**—King Arthur's knights were so called because they sat round a round table made by Merlin for King Leodogran. This king gave it to Arthur on his marriage with Guinevere.

**Koppenberg.**—The mountain of Westphalia to which the pied piper (Hunting) led the children, when the people of Hameln refused to pay money for killing their rats. Browning's poem, *The Pied Piper*, tells the tale.

**Kriemhild or Christild.**—The heroine of the *Nibelungenlied* the sister of Günther, king of the Burgundians, and the wife of Siegfried, after his death, marrying Etan, king of Denmark, who was the Gudrun of the *Völsunga Saga* and the *Edda*.

**Lake of the Cat.**—Name given to Lake Erie until the last of the seventeenth century.

**Lake Poets.**—The Wordsworths, Southey, and Coleridge, who lived about the lakes of Cumberland.

**Lampoon.**—A personation of a lampoon. Lampoon, these libels, carried to excess in the reign of Charles II., acquired the name of lampoons from the burden run in them, *My lampoon, my lampoon, my lampoon*.

**Land of Beulah.**—The paradise in which souls wait before the resurrection. *Edgar's Progress* the land from which the pilgrims enter the Celestial City. The name is found in Isaiah lxi. 4.

**Land of Bonadage.**—A name given to the land in the bible.

**Land of Cakes.**—A name sometimes given to Scotland, because oatmeal cakes are a common national article of food, particularly among the poorer classes.

**Land of Nod.**—In common speech sleepy-land or land of dreams.

**Land of Promise.**—The land promised to Abraham—Canaan.

**Land of Shadows.**—A place of unreality, sometimes called the land of shadows.

**Land o' the Leal.**—An unknown land of happiness, loyalty, and virtue. Caroline Oliphant, heroine of *Land o' the Leal*, was in her song and this is now its accepted meaning.

**Land of Wisdom.**—A name given to Normandy, in French history. Normandy was a land of wisdom prevailed there, and also because of the skill and judgment of the people in making laws.

**Land of Youth.**—A name given to the island of Hawaii, in the Pacific Ocean.

**Landlady's Daughter.**—She showed Fleming "over the Rhine-stream, rapid and roaring wide," in *Landlady's Daughter*, the heroine of the novel.

**Last of the Mohicans.**—The Indian chief Uncas is so called by Cooper in his novel of that title.

**Laurel.**—Sir, Stewart of King Arthur, James Russell Lowell has a poem entitled *The Vines of Sir Laurel*.

**Lavaine.**—Son of the lord of Astolat, who accompanied Sir Lancelot when he went to tilt for the ninth diamond. Lavaine is described as young, brave, and a true knight. He was brother to Elinor.

**Lavinia and Palemon.**—Lavinia was the daughter of Acato, patron of Palemon. Through Acato's treachery, Lavinia was sold to a fortune teller, and his friend, Acato lost his property, and dying, left a widow and daughter in poverty. Palemon often sought them, but could not find them. One day, a lovely modest maiden came to glean in the Acato's fields. The young squire was greatly struck with her beauty, and he loved her, but she was known as a pauper and he dared not give her more than a passing glance. Upon inquiry he found that the beautiful maiden was the daughter of Acato; he proposed marriage, and Lavinia was restored to her rightful place.

**Leandro.**—Governor of Messina in Shakespeare's *Much Ado About Nothing*. He prematurely acceded to the proposals made by Don Pedro.

**Leontine.**—In Shakespeare's *Pericles*. Servant to Dionysa. The latter conspired with him to murder his master, and was saved from the crime only by the intervention of pirates.

**Leonor.**—In *Molière's Les Fâmes de Maris*, sister of Leonidas, originally brought up by Acato according to his sentence of training a girl to make him a good wife. He put her on her honor, tried to marry her, and finally, when she refused, he was liberated consistent with propriety and social etiquette, and found that she loved him, and made him a good wife.

**Little John.**—A big, stalwart fellow, named John Little, who encountered Robin Hood, and gave him the name of Robin Hood, and was with him, christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

**Little Nell.**—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, and a beautiful girl, who was with her, and was christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

**Little Nell.**—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, and a beautiful girl, who was with her, and was christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

**Little Nell.**—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, and a beautiful girl, who was with her, and was christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

**Little Nell.**—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, and a beautiful girl, who was with her, and was christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

**Little Nell.**—*Old Curiosity Shop*, Dickens. The prominent character of the story, pure and true, and a beautiful girl, who was with her, and was christened, and Robin stood godfather. Little John is introduced by Sir Walter Scott in *The*

*Scottish Rites*.

[illegible]

diction. Castor was famous for his skill in managing horses, and Pollux for his boxing.

**Cauter.**—In Mohammedan mythology the lake of paradise, whose waters are as sweet as honey, as cold as snow, and as clear as crystal, and any believer who tastes thereof is said to thirst no more.

**Cerberus.**—In mythology is represented with upper and lower jaws, the lower part of which is a dragon. Cerberus is said to have founded Athens, and to have divided Asia into twelve constituent states, and to have introduced the elements of civilized life; he instituted marriage, abolished bloody sacrifices, and taught his subjects how to worship the gods.

**Centaurs.**—Monsters, half horse, half human. They are supposed to dwell in the mountains of the Lapiths in the mountains of Thessaly.

**Cephalus.**—Husband of Procris, loved by Eos, who advised him, when he rejected her advances, to try his wife's fidelity. Cephalus himself as a lover, he returned to Procris, but she received his advances with disdain. He made himself known, loaded her with reproaches, and left her in a rage. Procris then fled to Crete, where Artemis gave her a dog and an unerring spear and sent her back. To obtain the dog and spear, Cephalus pretended to love her, and a reconciliation followed. He killed her accidentally with the spear.

**Cerberus.**—The guardian of hell, who keeps the entrance of the infernal regions. He prevents the living from entering and the shades from leaving. Cerberus is represented as a dragon with his lyre; and the sibyl who conducted Aeneas through the inferno, also threw the dog into it.

**Ceres.**—The daughter of Saturn, sister of Jupiter and Neptune. She was the goddess of corn, wheat, and harvest. She represented as riding in a chariot drawn by dragons, and crowned with poppies. She was the mother of Proserpine, who was seized by Pluto and shut her hair in corn flowers. Ceres was the Roman name for mother-earth.

**Chaos.**—The vacant space which existed before the creation of the world, and out of which the gods, men, and the animals of Chaos were called the brother of Erebus and Night.

**Charon.**—A god of the infernal regions, son of Noa and Erebus, who conducted the souls of the dead in a boat over the river Styx and Acheron.

**Charibdis.**—A woman who robbed travelers of their goods, and turned by a whirlwind into a monster on the coast of Sicily, opposite Scylla. Scylla and Charibdis are generally mentioned together to represent alternative dangers.

**Chilobabos.**—A musician, ruler in the land of spirits, and friend of Iambus. Personification of harmony in nature.

**Chimæra.**—A celebrated monster, griff, lion, and dragon, which continually vomited flames. It was destroyed by Bellerophon.

**Demeter.**—The goddess of Paris, he married Hebe which was betrayed by her to Menelaus, by whom he was slain and fearfully mangled on the capture of Troy.

**Delius.**—A name of Apollo, from Delos, the island in which he was born. The name Delia, of his first wife, Hera, was the same.

**Delphi.**—A town on Mount Parnassus, famous for the oracle and the temple of Apollo. Over the hill of Delphi, Hera was pierced the tripod on which sat the priestess through whose mouth he was thought to reveal the future.

**Demeter.**—The goddess of Ceres, whom she was evidently a goddess of the earth, whom some ancient system married to Zeus, the god of the heavens.

**Demogorgon.**—The genius of the soil or earth, the god of support of plants. He was depicted as an old man, bearded with moss, and was said to live underground.

**Demogorgon.**—A son of Prometheus, who, according to the legend, was, with his wife Pyrrha, the sole survivor of the Thesalian deluge.

**Demogorgon.**—An Italian deity, whom the Romans identified with the Greek Arcturus. At

Rome Diana was the goddess of light. She was a daughter of Jupiter, and was born of Leto, at Leto, on the island Delos, at the same time with Apollo. As in Apollo the sun was deified and as Diana was the goddess of the moon, she was

**Diade.**—Daughter of Belus, king of Tyre. She was married to Bithynus, who was murdered for the sake of his wife by Pygmalion. Diade then fled with some followers and founded Carthage.

**Diade.**—A neighboring king, Harbas, sought her hand in marriage, and she refused him. He then seized her, and she stabbed herself. Vergil, in the *Æneid*, makes Aeneas visit her, and her death the cause of the destruction of Tyre.

**Diade.**—A Greek hero of the Trojan war, a son of Iphidamas, and a king of Argos. He was a favorite of Athena, who was his patroness. He encouraged him to attack and wound both Mars and Venus, who were engaged on the side of the Trojans.

**Diade.**—The daughter of the goddess of the moon, she fed her mares on the flesh of his guests, was overcome by Hercules, and was given to the same horses as food.

**Diade.**—The youngest of the Titan sisters and reputed mother of Venus. The name has also been poetical applied to Venus herself.

**Dionysus (Bacchus).**—Son of Jupiter and Semele, the daughter of Cadmus. He was the god of wine, and is generally represented crowned with vine leaves.

**Dionysus.**—The avenging goddess, or Furies.

**Dionysus.**—The goddess of the moon, and hence also to the lower world.

**Discordia.**—A malignant deity corresponding with the Greek goddess of discord. She was driven from heaven by Jupiter because she sowed dissensions among the gods. At the suppers of Peleus and Thetis she threw an apple among the gods, which was the primary cause of the ruin of Troy, and of infinite misfortunes to the Greeks.

**Dises.**—Demons of Persian mythology. According to the Koran, they are ferocious and gigantic spirits who rule the sovereignty of hell.

**Dises.**—The most ancient oracle was that of the Delphic Oracle, which was the Oracle of the Mole, said to have been built by Democritus.

**Dises.**—A name given, sometimes, to Thor, the thunder-god in Norse mythology.

**Doris.**—Daughter of Oceanus and Thetis, wife of Nereus, and mother of the Nereides.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

**Draupni.**—The name of the golden ring which Odin, when he worked magic, it was burned on the funeral pyre of his son Balder.

before the present world, and separated the region of fog from the region of heat. Giants were the first beings who took life among the imbergs that filled this vast aby.

**Gladheim.**—The palace of Odin, in which were the great hall and the place where the gods and the twelve asen occupied by the gods when holding council.

**Gladir.**—A marvelous grove in Asgard, in which the leaves were of all shimmering red gold.

**Gleiderer.**—In Hindu mythology is a kind of wyph, the most lovely of the gods.

**Gnome.**—One of a class of spirits or imaginary beings which were supposed to tenant the interior parts of the earth, and in which the dwarfs and gnomes, etc., were cited. Rubezahl, of the German legends, is often left as a representative of the class.

**Goblins and Bogies.**—Familiar demons of popular superstition, a spirit which lurks about houses. It is also called loggibog. Goblins are used in a serious sense by Shakespeare in *Hamlet*, where the ghost is supposed to be a "spirit of health or goblin damned."

**Golden Apples.** The.—The golden apples in the gardens of the Hesperides were a great treasure which was thought to be altogether unobtainable. The gardens were watched by a monstrous dragon, and to bring the golden fruit to Eurystheus was one of the tasks imposed upon Heracles.

**Golden Fleeces.**—In Greek mythology, the husband of Medea, the son Phryxus, the husband of a ramine which died on the land, and he ordered him to be sacrificed to the angry gods. Phryxus made his escape over sea on a "ram" which had a golden fleece. When he reached Colchis he sacrificed the ram to Zeus, and gave the fleece to King Aetes, who was his uncle. It was afterward stolen by Jason in his celebrated Argonautic expedition.

**Graces.** The.—Three sisters, with heads covered with serpents. Two of them, Steno and Euryale, were immortal, while Medusa was mortal. Originally a beautiful maiden, she was changed into a gorgon by Athena for profaning her temple, and her appearance was so terrible that those who gazed upon her were impaled upon a stake. She was killed by Perseus, and Athena placed her head in the center of her shield.

**Graces.**—To the retinue of Venus belonged the Graces, servants and companions of the goddess. They were said to be daughters of Jupiter and Eurymome, or, according to other authorities, of Venus herself, and were three in number—Splenor, Pleasure, and Joy. They were honored, especially in Greece, and were worshipped in special cities. Altars were often erected to them in the temples of other gods, especially in those of Mercury, Venus, and Bacchus.

**Grim.**—Wife of Odin and mother of Vidar. She lent her garb, staff, and glove, warning him to beware of the serpent Fenrir.

**Gripri.**—A horse-trainer, servant of Odin, who could foretell events of the future. He could teach a young hero all the secrets of the world. He is compared to Chiron the Centaur.

**Hades or Pluto.**—Brother of Zeus and Poseidon, obtained the kingdom of the lower world in the division of the world among the three brothers, and his name was often used as synonymous with the abode of the shades. He carried off and married Persephone, or Proserpine.

**Hamadryades.**—Nymphs, each of whom was born and died with the tree in which she lived.

**Harmenia.**—A daughter of Menelaus and Helen. She was privately promised in marriage to Orestes, the son of Aegamemnon; but her father, ignorant of the engagement, gave her hand to Pyrrhus, the son of Achilles, whose services in the Trojan war he had valued.

**Harpies.**—Winged monsters who had the face of a woman, the body of a bird, and the claws of numbers armed with claws. They were three in number—Alto, Ocyete, and Celeno—and were daughters of Pontus and Erichonius.

**Hebe.**—Daughter of Zeus and Hera. She served as cupbearer to the gods until Hercules was received among them, when she was given to him in marriage.

**Hecate.**—A mysterious threefold goddess, daughter of Peres and Asteria. She presided over the dead and the living, and was worshipped on earth, and Proserpine in the lower world.

**Hector.**—Son of Priam and Hecuba, the bravest of the Trojan heroes. He married Andromache. Upon his killing Patroclus, friend of Achilles, the latter was reduced to vengeance. He pursued Hector and slew him, and then dragged his body at his chariot wheels into the camp of the Greeks.

**Hecuba.**—Daughter either of Phrygia or of Cyprius king of Thrace, wife of Priam. She was carried away as a slave by the Greeks, and was either transformed into a dog or threw herself into the sea.

**Heimdall.**—In northern tales a god who lived in the celestial city Himinbjerg, and used the extremity of the bridge Bifrost, and kept the keys of heaven. He is the watchman or sentinel of Asgard, sees even when he can hear the grass grow, and even the wool on a lamb's back. Heimdall, at the end of the world, will wake the gods with his trumpet.

**Hecuba.**—Daughter of Zeus and Leda, the most beautiful woman of Greece. In her youth she

was carried off by Theseus, but was rescued by her brothers Castor and Pollux. She married Themistocles and was married to him by Paris. The Greek chiefs who had been her suitors resolved to take vengeance, and accordingly she was sacrificed. From her ashes Paris she married his brother Deiphobus. When Troy was captured Helena betrayed Iphigeneus her two children, who made away through the air with whom she lived until his death. The accounts of her death differ.

**Hellas.**—The land of mountains in Boeotia, sacred to Apollo and the Muses, from which sprang the fountains of the Muses—Aganippe and Hippocrene.

**Hellas.**—The god of the sun, called Sol by the Romans.

**Hellas.**—The daughter of Athamas and Nephele and sister of Phryxus. When his stepmother Ino was about to sacrifice Phryxus to Zeus, Nephele rescued her two children, who made away through the air on a ram with the golden fleece, which Hermes gave. Between Egeus and the Cerebusian. Helles fell into the sea, which received the name of Hellespont in consequence.

**Hellas.**—Son of Deucalion and Pyrrha, mythical ancestor of the Greeks.

**Hell Shoon.**—In Icelandic mythology indispensable for the journey to Valhalla as the obolus for the ferryman.

**Helmet of Hades.**—A helmet borrowed from Pluto and worn by Perseus, rendering him invulnerable. It was lent him by Hermes, the god of commerce, wings, winged shoes, and a short sword.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

**Hellas.**—The Greek name for the hero Jupiter, known among the Romans as Juno. His wife was Minerva, who placed it in the hands of her shield.

veiled in darkness. Their names were *Hades*, *Erebyth*, and *Arcthus*; and they were appointed to rule the golden age, which were the gift of Earth to Juno on her wedding day. The celebrated gardens of the Hesperides abounded with fruit, and were carefully guarded by a dragon which never slept.

**Hesperus.**—A supposed son or brother of Atlas and Procrustes, who was killed by his death, and made identical with the evening star.

**Hestia.**—The Greek name for *Vesta*. She was the goddess of the hearth.

**Hippocrene.**—A fountain of the Muses, on Mount Helicon, in which they bathed. "The whole world was celebrated for its fresh fountains and cool groves, and flowery slopes"; and the legends of the locality, as if in sympathy with its natural beauty, were full of legends, which characterized those of other mountains more wild and rugged.

**Hippolyte.**—A queen of the Amazons, given in marriage to Theseus by Hercules. Hippolyte was their son.

**Hippolyte.**—Son of Theseus and Hippolyte. His stepmother, Phaedra, fell in love with him. He fled to the washers, where, his horses taking flight and rushing among the rocks, his chariot was broken into pieces, and he was killed. According to some accounts, he was restored to life by Asclepius.

**Hippomenes.**—Son of Megareus, and great-grandson of Poseidon (Neptune). He conquered Ascalaphus, the foot-baller, by using three golden apples, one of which he stopped to pick up.

**Hippomenes.**—An avil spirit known among American Indians.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Hippomenes.**—A famous German kobold, or domestic fairy servant; so called from wearing a little felt hat pulled down over his face.

**Palladium.**—A sacred image of Athena, which was supposed to keep safe the city in which it was preserved. Zeus threatened to destroy it as Hera was beginning to build Troy, and Ilus built a sanctuary for it. Ulysses and Diomedes carried it away.

**Pallas.**—A name of Minerva. She is said to have received the name because she killed a giant named Pallas during that name.

**Pan.**—The god of shepherds, huntsmen, and the inhabitants of the country. He was in appearance a monster; he had two small horns on his head, and his legs, thighs, tail, and feet were like those of the goat. He was the inventor of the syrinx or shepherd's flute. Sudden fright without visible cause, a panic, was ascribed to Pan. The Romans identified Panus with him.

**Panarus.**—A son of Lyones, who aided the Trojans in their war with the Greeks. He broke the three which had been made between the contending armies, and wounded Neleus and Diomedes. He was at last killed by Diomedes.

**Pandion.**—King of Athens, father of Proene and Philomela, in whose reign Bacchus and Demeter are said to have come to Attica.

**Pandora.**—The first woman on earth. When Prometheus stole fire from heaven Zeus bade Hephestus to make a woman from earth. Aphrodite gave her beauty, Hermes boldness and cunning, and each god gave some gift. Hermes took her to Epimetheus, who married her. In his house she was a jar which contained all the evils of Pandora was tempted by curiosity to open the lid, when all the evils inside into humanity poured out, and she had no time to shut the lid, preventing the escape of Hope.

**Panthemon.**—A celebrated temple at Rome, built by Appius in the reign of Augustus and dedicated to all the gods.

**Parce.**—The Fates, powerful goddesses who presided over the thread of life. There were three in number, Clotho, Lachesis, and Atropos, daughters of Nox and Erebus, according to Hesiod, or, according to what he says in visible place, of Jupiter and Themis.

**Paris.**—In Greek mythology, the second son of Priam, king of Troy. He was called Paris because he dreamed before his birth that he had brought forth a firebrand, which was interpreted to mean that he would cause the destruction of Troy. To prevent this the child was exposed on Mount Ida, where he was discovered by a shepherd, who brought him up as his own son. He was brave and courageous, and was loved by the gods. He was a nymph of Ides, who he married. At the marriage of Peleus and Thetis a dispute arose whether Here, Athena, or Aphrodite was the most beautiful, and as each entitled to the golden apple, Paris was chosen judge. He decided in favor of Aphrodite, who had promised him the fairest woman in the world for his wife. Subsequently he was killed by Hector. He married Helen, who had married Menelaus (or Helen), the fairest woman of the same name, and he was killed with him. This led to the siege of Troy, at the capture of which he was killed by an arrow.

**Parthenos or Parnassos.**—A mountain near Delphi, in Greece. It contained numerous caves, grottoes, and romantic ravines. It has two summits, one of which was consecrated to Apollo and the Muses, the other to Bacchus. It was anciently called Parnassos, from Iarnas, an ark, because Deucalion's ark stranded there after the flood. It was the oracle of Delphi was built at its foot it received the name of Parnassos. It is celebrated as one of the chief seats of Apollo and the Muses, and an inspiring source of poetry and song.

**Parthenope.**—One of the sirens, whose dead body was washed ashore on the present site of Naples. She threw herself into the sea out of love for Ulysses.

**Patroclus.**—The gentle and amiable friend of Achilles in Homer's *Iliad*.

**Patuk.**—Name given to the great power, death, in American Indian mythology.

**Pau-Puk-Keewis.**—In American Indian folklore a mischievous magician, who is pursued by Hiawatha, goes through a series of transformations in his endeavors to escape, and finally becomes an eagle.

**Pax.**—The goddess of peace, worshipped in Greece under the name Irene. Pax wears a crown of laurel, and holds in her hand the branch of an olive tree.

**Pebson.**—In American Indian folklore the personification of winter in form of a great giant who shook the snow from his hair, turning it into stone by his breath.

**Pegaseus.**—The winged horse which sprung from the blood of Medusa when she was slain by Perseus and was used by Zeus to carry thunder and lightning. He was also the horse of the Muses.

**Peleus.**—King of the Myrmidons at Phthia in Achaia. He was in conjunction with his brother Telamon murdered his half-brother Thersites, he was expelled by Aeneas from Agina and went to Phocia. He was killed by the murder by Eurymachon who gave Peleus his daughter Antigone in marriage, and a third part of his kingdom.

**Pelias.**—The name of the spear of Achilles, which was so large that none could wield it but the hero himself.

**Pelion.**—A high mountain in Thessaly celebrated in mythology. Near its summit was the cave of the Centaurs. The Centaurs, who lived with the gods, are said to have attempted to keep Oene and Olympus on Pelion, or Pelion and Oene on Pelion, in order to make the mountain the timber was felled with which the ship Argos was built.

**Pelopides.**—Son of Tantalus and Dione, husband of Hippodamia, king of Pisa in Elis; from him the southern peninsula of Greece, or the Peloponnese, derives its name. His father had seduced his wife, and he was killed by his father, and his mother was banished to a banquet, and killed Pelopides and served him; they refused to taste the dish, and he was treated to a banquet in order to make him believe the timber was felled with which the ship Argos was built.

**Pelopides.**—The household gods of the Romans, in Latin, *Penates*, were the gods of the household.

**Penelope.**—The faithful wife of Ulysses, who being importuned, during his long absence, by numerous suitors for her hand, postponed making a decision among them until she should have finished weaving a funeral pall for her father-in-law, Laertes. Every night she secretly unraveled what she had woven by day, and thus put off the suitors till Ulysses returned.

**Perceus.**—Favie are delicate, graceful, fairy-like beings of eastern mythology, begotten by fallen spirits. They direct with a wand the pure in mind the way to heaven. These lovely creatures, according to the Koran, are under the sovereignty of Eblis, and Mohammed was sent for their conversion.

**Peres or Peresela.**—A daughter of Oceanus, and wife of Helios (the sun), by whom she became the mother of the sun-god, and the goddess of the sun.

**Persele.**—A name given to Hecate, as the daughter of Peres by Asteria.

**Perseus.**—The Greek name of Proserpine. Homer describes her as the wife of Hades (Pluto), and the formidable, venerable, and majestic queen of the underworld.

**Perseus.**—A name given to the god of the underworld, who was born in the boat in which they were set adrift when Perseus was born, treated them kindly, but in the end he was killed by the Gorgon Medusa.

**Perseus.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

**Phedra.**—A daughter of Minos and Pasipha, who obtained the wisdom and the magic wand, and went to Attica, where he discovered and saved Andromeda. He afterward returned to Argos, and was killed by his brother, who was his grandfather, by hitting him with a quail.

sequence of the intrigues of his stepmother Ino. Nephele rescued her children, who rode away on a ram with the golden fleece, and fell in love in Colchia, married Chalciope, daughter of Aetes, and sacrificed the ram to Zeus.

**Phyllis.**—The daughter of Rhiparus, according to some authorities, of Lycurgus, king of Thrace. She rescued Demophoon, who landed on her coast on his return from the Trojan war, and fell in love with him, and he reciprocated her affection; but afterward proving faithless, Phyllis hanged herself, and her body was thrown into the sea, and was blown into an almond tree.

**Phylax.**—King of Latium, son of Saturn, who married Venus. He was hunting he was met by Circe, who became enamored with him. She changed him into a woodpecker.

**Phylax.**—The name given to the Muses, because they were born in Phylax, or, as some say, because they were supposed to be daughters of Phylax, a king of Macedonia, who settled in Boeotia.

**Phryne.**—A celebrated fountain at Corinth, at which Bellerophon is said to have caught the horse Pegasus. It gushed forth from the rock in the Acrocorinthus, was conveyed down the hill by subterranean conduits, and fell into a marble basin, from which the greater part of the town was supplied with water. The poets frequently used Phryne in the general sense of Corinthian.

**Phleas.**—Means the "sailing stars," because the Greeks considered navigation safe at the return of the stars. The Phleas were the seven daughters of Atlas and Pleione, named Electra, Alcyon, Sthenelox, Arcturus, Loxos, and Merop. They were transformed into stars, one of which (Merop) is invisible, out of shame because she was the only one who refused to call the invisible star "Electra," and say she hides herself from grief for the destruction of the city.

**Phlo.**—He was a second brother of Jupiter, and received, as his portion in the division of empire, the inferior regions of the world of shades. The chief incident in the history of Pluto is his seizure and abduction of Proserpine, who thereby became his wife and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

**Phlo.**—The god of riches; was probably of allegorical rather than mythical origin, since his name is Greek, and not Latin. He was the god of riches, and the queen of the lower world.

## SCIENCE

### OF THE SCIENCES—SCIENCE (Latin, *Scientia*, that which we know) is human experience, tested and refined, and differs from creed (that which one believes), resting on bases other than human experience; it differs from philosophy (our generalization as to that which transcends or lies beyond human experience); it differs from mere fact or record not set in order; it differs from history in dealing properly with causes and effects shown in proper relations. It differs also from art, which is essentially action based on human knowledge. In common language, however, the art and the science on which it rests may often receive the same name, as in the case of agriculture, which word implies a science,

or group of sciences, relating to the rearing of crops, and also the use of this classified knowledge or science in actual practice.

In the language of modern Europe, the names of most of the sciences are derived from Greek roots, the second element in each being *lógos*, *logos*, a discourse. Thus osteology (*osteeos*, *osteon*, bone) is a discourse on bones; ornithology (*ornis*, *ornis*, bird) a discourse on birds. More exactly we may say that osteology is the science of bones. Again as each science is to the individual man an object of study, osteology becomes pedagogically the study of bones. By the addition of *lógos* to a Greek root, an indefinite number of additional words can be framed, and will be framed in the future as the need

for expression shall arise. For example, we may have rhodology, the science or the study of roses; orchidology, the science or the study of orchids; cynology, the science or study of dogs.

Other names applied to sciences conventionally terminate in the termination *ics*, which forms in many cases a euphonic ending. Thus optics, the science of vision (*opsis*, *ops*, eye); ceramics (*keramos*, *ceramos*, a pitcher), the science of pottery. Other words of this sort might be readily devised, as cynics, the science of dogs; rhodics, the study of roses. Still other terms end in English in *graphy* (*graphein*, to write), indicating that the science is accompanied by writings or drawings: as geography, description of the earth, as distinguished from geology, the study or science of the earth (*gē*, *ga*, earth). Still other recognised names of science spring from various roots, mainly from the Greek.

Beginning with inorganic nature, we may make the following classification of those branches of science which have recognised names in the English language.

### SCIENCES OR STUDIES OF INORGANIC NATURE

#### Concerning the Heavens

**ASTRONOMY:** science or study of the stars.  
**Cosmology:** science of the universe.  
**Uranography:** science (mapping) of the heavens.  
**ANEMOLOGY:** science of winds.  
**Climatology:** science of climates.  
**Crystallography:** science of crystals.  
**Epidemic Geology:** science of forces molding earth from without.  
**Geodasy:** science of the earth's surface.  
**Geognosy:** science of the earth's peculiarities.  
**Geography:** science (mapping) of the earth's surface.  
**Geology:** science of the earth.  
**Hydrography:** science of river basins.  
**Hypogeal Geology:** (Plutonics) science of forces molding earth from within.  
**Lithology:** science of stones.  
**Metallography:** science of metals.  
**Metalurgy:** science (and art) of metals and ores.  
**Meteorology:** science of weather phenomena.  
**Mineralogy:** science of minerals.  
**Oceanography:** science of the ocean basins.  
**Oreography:** science of mountains.  
**Petrography:** science of rock composition.  
**Phytography:** science of the physical features on the earth's surface (also called physical geography).  
**Seismography:** science of recording earth tremors.  
**Seismology:** science of earthquakes.  
**Stratigraphy:** science of rock strata.  
**Topography:** science of the modifications of land surfaces.

#### Concerning the Earth

**PERVANCE:** the science of mass and force.  
**Dynamics:** science of force.  
**Mechanics:** science of application of force.  
**Thermodynamics:** science of force as related to heat.  
**Acoustics:** science of sound and hearing.  
**Astrophysics:** the science of physical features of the stars.  
**Caloric:** science of heat, as a mode of motion.  
**Electricity:** the science of the mode of motion known as electric currents.  
**Galvanism:** the science of galvanic electricity.  
**Geophysics:** science of physical features of the earth.  
**Hydraulics:** science of moving water.  
**Hydrodynamics:** science of the relation of liquids and power.  
**Hydromechanics:** science of power derived from motion of water.  
**Hydrostatics:** science of pressure of water at rest.  
**Magnetism:** the science of magnetic electricity.  
**Optics:** science of light and vision.  
**Pneumatics:** science of relations of gases to force or power.

#### Concerning Mass and Force

**CHEMISTRY:** the science of the intimate composition of matter.  
**Alchemy:** science (and art) of the alleged transformation of baser metals into gold.  
**Biochemistry:** the science of the chemistry of living beings.  
**Inorganic Chemistry:** science of elements and compounds not produced by the process of life.  
**Organic Chemistry:** science of the chemical compounds produced by the processes of life.  
**Physical Chemistry:** science of the features of matter involving both physics and chemistry.  
**Physiological Chemistry:** science of chemical changes within the bodies of animals.  
**Spectroscopy:** science (and art) of relation of chemical substances in the stars or on earth to the light spectrum.

#### Concerning the Molecules and Lesser Divisions of Matter

**BIOLOGY:** science of life and of living organisms (animals and plants).

**Analogy:** the science or study of chance relationship.  
**Anatomy:** science of the structure of living organisms.  
**Bioomics:** science of changes in form of living organisms due to life adjustment and to other causes, from generation to generation.

**Comparative Anatomy:** science of the relation of forms in organs of living beings.

**Cytology:** science of the structure and functions of the organic cells forming tissues in living beings.  
**Dietetics:** science of food stuffs in relation to digestion.

**Ecology:** science of the adjustment or behavior toward environment of living organisms (used chiefly in reference to plants).

**Embryology:** science of the development of the fertilised germ-cell through different stages; the science of embryo.

**Environment:** science of the effects of the results of external conditions in the development of individuals or species.\*

**Heredity:** science of continuity of type, from generation to generation (the name also applied to the law or fact of such continuity).\*

**Histology:** science of the tissues of which organs are formed.

**Homology:** the science of underlying resemblances in man or lower organisms, the supposed impress of common heredity.

**Hygiene:** science of the methods of maintaining health; (is used chiefly in reference to man).

**Isolation:** science of the results of the separation of individuals from the mass of the species.\*

**Morphology:** science of forms in organs of living organisms.

**Ontology:** science of the life history of the individual.

**Organic Evolution:** science of orderly change in life forms from generation to generation; (the name more often applied to the fact or process than to the science).

**Pathology:** science of diseases in men or other organisms.

**Phylogeny:** science of the history or development of the species or type.

**Physiology:** science of the functions of the organs of living beings.

**Sanitation:** science of the processes of maintaining health.

**Selection:** science of the results of the survival of one class of individuals as compared with others, from generation to generation.\*

**Taxonomy:** science of the orderly arrangement of living beings according to their structure or according to their supposed origin or development. Classification is the general name for the processes of taxonomy.

**Teleology:** science of real or supposed purpose or adaptation in structures of men or lower organisms.

**Teratology:** science of monstrosities and their causes among men or other organisms.

**Variation:** science of individuality and the tendencies to divergence from generation to generation.\*

\* The terms Environment, Heredity, Isolation, Selection and Variation are used more generally in the sense of factors in organic evolution of species or types.

## SCIENCES OR STUDIES OF INORGANIC NATURE—Continued

## Sciences Chiefly or Wholly Related to Plants

**BOTANY:** science of plants.  
**Abiogenesis:** science of (alleged) spontaneous generation of organisms.  
**Agriculture:** science (and art) of cultivation of the fields.  
**Agrostology:** science of grasses.  
**Algology:** science of seaweeds.  
**Arboriculture:** science (and art) of tree culture.  
**Bacteriology:** science of bacteria and microbes.  
**Bryology:** science of mosses.  
**Dendrology:** science of trees.  
**Diatomology:** science of diatoms, minute one-celled plants.  
**Forestry:** science (and art) of care and culture of forests.  
**Fungology:** science of fungi (toadstools, molds, etc.).  
**Horticulture:** science (and art) of plant culture.  
**Lichenology:** science of lichens.  
**Limnology:** science of swamp-land.  
**Paleobotany:** science of extinct vegetation.  
**Phytogeography:** science of the geographical distribution of plants.  
**Pteridology:** science of ferns.  
**Xerophytology:** science of desert vegetation.

**ZOOLOGY:** science of animals.

**Andrology:** science of male organisms as such.  
**Animal Psychology:** science of nervous impulses and nervous reflexes.  
**Cardiology:** science of crustaceans (crabs, lobsters).  
**Conchology:** science of shells.  
**Cranology:** science of skulls.  
**Dermatology:** science of the skin and its functions.  
**Entomology:** science of insects.  
**Gastrology:** science of the stomach.  
**Gynaecology:** science of female organisms as such.  
**Hemintology:** science of worms.  
**Herpetology:** science of reptiles.  
**Ichthyology:** science of fishes.  
**Laryngology:** science of the throat and its functions.  
**Mammalogy:** science of mammals.  
**Myology:** science of muscles.  
**Neurology:** science (anatomy, physiology, pathology) of nerves.  
**Obstetrics:** science of the process of birth.  
**Odonatology:** science of the teeth.  
**Oology:** science of eggs.  
**Ophthalmology:** science of the eye and its functions.  
**Organography:** science of the organs.  
**Ornithology:** science of birds.  
**Osteology:** science of bones.  
**Otology:** science of the ear and its functions.  
**Paleontology:** science of extinct organisms.  
**Paleozoology:** science of extinct animals.  
**Parasitology:** science of parasites.  
**Phinology:** science of the nasal apparatus and its functions.  
**Pisciculture:** science (and art) of artificial rearing of fishes.  
**Protozoology:** science of protozoans.  
**Ricketology:** science of skeletons.  
**Somatology:** science of the body.  
**Teleology:** science of (alleged) effects of the first father on the progeny of a second, by the same mother.  
**Therology:** science of beasts.  
**Thremmatology:** the science of selective breeding of domestic animals.  
**Triebology:** science of the hair.  
**Zoogeography:** science of geographical distribution of animals.

## Sciences Primarily Concerning the Lower Animals or Concerning Man as an Organism

**ANTHROPOLOGY:** science of the human species.  
**Astronautics:** science (and art) of air flight.  
**Esthetics:** science of beauty and of appreciation of beauty.  
**Anthology:** science of flowers—used chiefly for flowers of expression or choice lyric verse.  
**Apologetics:** science of truth and falsehood in theological speculation.  
**Archaeology:** science of ancient works of man.  
**Archæthetism:** science of the supposed pervading mind preceding the existence of conscious animal life.  
**Assyriology:** science of ancient relics of Assyrian civilisation.

## Sciences Relating Chiefly or Exclusively to Man as a Member of Society

**Astrology:** science of the imaginary influences of the stars on human affairs.  
**Athletics:** science (and art) of bodily exercise.  
**Biography:** science of individual life records.  
**Demonology:** science of (supposed) spirits, mostly evil.  
**Dialectics:** science of argumentation.  
**Didactics:** science (and art) of instruction.  
**Dogmatics:** science of asserted truths.  
**Doxology:** science of belief (commonly used as the name of a brief song of praise).  
**Ceramics:** science (and art) of pottery and pottery making.  
**Chronology:** science of time.  
**Civics:** science of civil relations of man.

## Sciences Relating Chiefly or Exclusively to Man as a Member of Society (Continued)

## Exact Sciences

**Cookery:** science (and art) of preparing food for man with the aid of heat.  
**Criminology:** science of crime and criminals.  
**Economics:** science of proper relations of man.  
**Education:** science (and art) of mental development to man.  
**Egyptology:** science of ancient Egyptian civilisation.  
**Epistemology:** science of sources of human knowledge.  
**Eschatology:** science of "doctrines of uttermost things," more especially speculations as to a future state.  
**Ethics:** science (and art) of human conduct.  
**Ethnography:** descriptive science of men, races and tribes of men.  
**Ethnology:** science of the significance of races of men.  
**Ethology:** science of human behavior.  
**Etymology:** science of word-derivation.  
**Eugenics:** science of the conditions of being well born, as regards possibilities of development in the individual life.  
**Finance:** science of money as a medium of exchange.  
**Genealogy:** science of lines of descent by heredity.  
**Genesis:** science of origins.  
**Clyptology:** science of sculpture.  
**Graphics:** science of drawing.  
**Gymnastics:** science (and art) of muscular exertion.  
**Hagiology:** science of saints and of writings regarded as sacred.  
**Harmonics:** science of music and of harmony in sound.  
**Hellenics:** science of Greek culture.  
**Hermeneutics:** science (or art) of expounding sacred writings.  
**Homiletics:** science (and art) of teaching by spoken discourse.  
**Hymnology:** science of hymns or religious poetry.  
**Jurisprudence:** science of law.  
**Linguistics:** science of speech.  
**Logic:** science of proof in matters of cause and effect.  
**Medicine:** science (and art) of healing disease.  
**Metaphysics:** study of matters that transcend physical knowledge.  
**Military Science:** science of war and of methods of human destruction.  
**Mythology:** science of myths and legends.  
**Papyrography:** science (and art) of reading ancient records—on papyrus.  
**Pathology:** science of disease.  
**Pedagogy:** science of education in man.  
**Pediatrics:** science of disorders of childhood.  
**Pedology:** science of development of the child in man.  
**Pharmacutics:** science of drugs.  
**Pharmacology:** science of the effects of chemical substances on animal organisms.  
**Philology:** science of words and word evolution.  
**Philosophy:** a study of that which transcends human experience.  
**Phonetics:** science of pronunciation of vocal sounds.  
**Phonology:** science of vocal sounds.  
**Politics:** science of relations of men as citizens and as groups of citizens; the science of citizenship.  
**Psychiatrics:** science of nervous disorders.  
**Psychology:** science of nervous reflexes and mental operations.  
**Psychotherapeutics:** science of healing agencies operating through the senses (as suggestion, etc.).  
**Pugilistics:** science (and art) of fist-fighting.  
**Sciosophy:** study of the shadows cast by imperfections in science.  
**Sociology:** a group of sciences concerning human society.  
**Splanchnology:** science of the internal organs or viscera.  
**Surgery:** science (and art) of healing through cutting diseased or injured tissues or organs.  
**Telegraphy:** science (and art) of "distance-writing" by the use of the telegraph.  
**Telepathy:** science of (alleged) transmission of knowledge without the use of sense organs.  
**Telephony:** science (and art) of "distance-speaking" by means of the telephone.  
**Theology:** science of deity and of divine control of the universe; also of the opinions entertained by men in regard to these matters.  
**Therapeutics:** science of healing agencies.  
**Toxicology:** science of poisons or chemical substances pernicious to animal life.  
**Veterinary Medicine:** science (and art) of healing disease in domestic animals.  
**MATHEMATICS:** logic applied to space and number.  
**Algebra:** science of mathematical formulæ.  
**Arithmetics:** science of numbers.  
**Geometry:** science of measurements of space.  
**Horology:** science of measuring time.  
**Trigonometry:** science of measurement of angles.  
**Calculus:** science of calculations based on the conception of limit.
